

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

- Churning, performed by dogs, 304.
- Cicada or locust, remarks on by Augustus A. Gould, 417.
- Cider, premiums on, 301.
- Claggett, W. his remarks on manures, 266; on sowing grass seeds, 307.
- Clarke, Anna L. statement relative to the manufacture of silk, 90.
- Clarke, Wm. Jun. on ploughing and recruiting grass land, 345.
- Clay, Hon. Mr. notice of his visit to Col. Jaques' farm, 134; handsome present to, 167.
- Cleanliness and health, 338.
- Cloak, gum elastic, 77.
- Clove of the twelfth volume, observations on, 422.
- Clothes catching fire, 316.
- Clover, a new kind, (trifolium incarnatum) Mr. Lowell's notices of, 161; on the culture of, 405.
- Clover hay, remarks on curing, 410.
- Clover and timothy hay for stock recommended, 24.
- Clover seed, great yield of, 310; should not be kept in oak casks, 414.
- Clover and wheat, remarks on, 349.
- Coal mines of Pennsylvania, notice of, 264.
- Cobb, J. H. on the Chinese Mulberry, 212.
- Codding, W. T. his notices of farming operations, 164.
- Coffin, Hector, on making butter, &c., 20.
- Colman Henry, recommends exact and experimental agriculture, 36; on the quantity of Indian corn raised

- on an acre by different persons, 146; his address to the Hampshire, Franklin and Hampden Agricultural Society, 223, 233, 241.
- Colts, on breaking, 113, 178.
- Combustion, spontaneous, of drunkards, 378.
- Composts, how made, 374.
- Consumption, horehound and milk recommended for, 93; caution to females concerning, 163, 254.
- Convicts, a remarkable fact concerning, 163.
- Cork mattress, Knapp's, notice of, 61.
- Corn race for a thousand dollars, 169.
- Corn, salting of to prevent its becoming musty, 140.
- Corn and oats, early crops of, 51.
- Corn soup, recipe for making, 77.
- Corns, recipes for curing, 45, 69.
- Cornucopia, on selecting seed corn, 164.
- Corn planter, on cultivating Indian corn, 404.
- Cottage, the felicity of, 83.
- Cotton manufactures, improvements in, 5, 17.
- Couch or quitch grass, best mode of destroying, 77.
- Cough, a prescription for, 77.
- Cow that produced six pairs of twins, 45; domesticated, 237.
- Cows and milch heifers, report on by a Committee of the Essex Agricultural Society, 9; remarks on the management of, 166; winter feeding for, 166; profits derived from, 403.
- Cream from milk, new method of obtaining, 12.
- Credit system, remarks on, 336.
- Crocodile birds, 389.
- Crops, failure of, in Canada, 118.
- Croup, a recipe for, 77; another, 308.
- Crows hatched under hens in New Hampshire, 27; the utility of destroying them doubted, 273; debate on in the Massachusetts Legislature, 230.
- Cucumbers, recipes for pickling, 76, 81; how cultivated, 236.
- Current wine, receipt for making, 381.
- D. on preserving bacon from skippers, 131.
- Dairy, remarks on, 20.
- Dandelion, cultivated by Mr. G. Pierce, 366.
- Danvers, on a new mode of cultivating melons, 358.
- Deafness of the aged, remarks on, 43.
- Dearborn, H. A. S. his report on horticultural proceedings, 75.
- Delavan, Henry W. on draining, 309.
- Derby, E. H. his application for a premium on live hedges, 227; his premium crop of turnips, 235.
- Docking horses, impolicy and cruelty of, 372.
- Dogs, uses of, 92, 224; muzzled in Philadelphia, 414.
- Draining, remarks on by J. D. 230; by R. Howard, 273; by Judge Buel, 306; by Henry W. Delavan, 309.
- Dress, household goods and fuel, from Cobbett's Cottage Economy, 269.
- Drought in Georgetown, D. C. 73; stirring the ground, a remedy for, 352.
- Drunkards, spontaneous combustion of, 378.
- D. T. on Gama grass, 245.
- Ducks, wild, instinct of, 24.
- Dutch, cleanliness of, 256.
- Dwelling houses, on the erection of, 301.
- Early rising recommended, 63.
- F. A. N. on milch cows, 212.
- Eaton, Amos, statement by, relative to a swine's attachment to its birth place, 187.
- Economy, domestic, 2-2; worthy example of, 400.
- Eddy, Joseph, on destroying the Canada thistle, 308.
- Eddystone lighthouse, how built, 59.
- Education, remarks on from Sullivan's Address, 152.
- Eggs, Scotch method of preserving, 423.
- Elder, black or common, uses of, 302.
- Elephants for ploughing, 177; sagacity of, 424.
- Elliot's patent winnowing mill, 249.
- Elm, a large, notice of, 149.
- Eminence attained by men of obscure origin, 80.
- Employment indispensable to comfort, 221.
- Engrafting and setting out trees in the same season, 299.
- Erie canal, value of, 221.
- Essence peddling, remarks on, 181.
- Essex North, on botts in horses, 219; on warming houses, 219.
- Everett, Hon. A. H. his address to the Mass. Hort. Soc., 252, 257, 365.
- Everett, Hon. Edward, notice of his address before the Mercantile Library Association of N. York, 163.
- Ewes and lambs, remarks on, 318.
- Exercise and diet, Dr. Danforth's advice on, 251.
- Experimental agriculture, notices of by G. Parsons, Esq. and by the Editor, 246.
- Experiment, on the use of lime in wheat crops, 236.
- Experiments, partial remarks on, 5.
- Eyes, hints for people with, 285.
- Factory girls, not so much oppressed as represented, 24.
- Fair sex, advertisement addressed to, 216.
- Fall ploughing recommended, 93.
- Fall of Gemburg, 192 feet, 128.
- Farm, a profitable, 139; size and stocking a, 219; productive small one, 291.
- Farmer, the profession of recommended, 270.
- Farmer, the practical, on sowing grass seeds, 60; remarks on the arithmetic and profits of, 196; to make a, 234.
- Farmer, a Dorchester, his remarks on the proceedings of the Mass. Hort. Soc., 409.
- Farmer, an old, on working it right, 148.
- Farmers, hints to, 2; a table useful to, showing the number of plants in an acre, planted at different distances, 149.
- Farmer's life, may be happy, 61.
- Farmer's work for November, 134, 158; for December, 166; for March, 286, 294; for April, 318, 334, 347; for May, 358, 374, 382; for June, 398; for July, 414.
- Farming operations, notices of, 164.
- Farming with rum, and farming without rum, 144; practical effect of seasonable, 147; profits of, 180; capital, requisite in, 346.
- Farm school, and Boys' Asylum, notices of, 357.
- Farriery, curious case in, 325.
- Female education, remarks on, 120.
- Female industry, instances of, 51.
- Fences, remarks on, 83; how best made of boards, 402.
- Fence posts, locust recommended for, 283; planted top end down, 331, 363; rendered durable by salt, 371.
- Ferry, Hiram, on the successful culture of wheat in Northampton, 26.
- Figs, New England, 93, 142.
- Fig tree, ancient and remarkable, 349.
- Fire, not known to some ancient nations, 424.
- Fire blight, remarks on, 14.
- Fire wood, comparative value of the different sorts of, 381.
- Fires extinguished by steam, 107.
- Fire wood, time of cutting and management of, 274.
- Fish, mortality among, 115; a new way to catch, 387.
- Fish pond, artificial, inquiries concerning, 273.
- Flax, quere respecting, 222; growth of, and manufactures of linen in the United States, 361.
- Floral dictionary, 48.
- Flour, on making the most of, 5.
- Flour and sugar, milk and butter, mixing of, 296.
- Flowers, on the culture of, 215; improvement in raising the seeds of, 236; how preserved after being cut, 283.
- Flower pots, new manufacture of, 81.
- Foddering cattle, remarks on, 206.
- Fossil ship, 334.
- Fowls, in breeding, the male and female should not be taken from the same litter of eggs, 291.
- Franklin on swimming, 186.
- Franklin Institute, extract from the last report of, 162.
- Frost, how prevented from throwing plants out of the ground, 181.
- Frost, E. on the culture of silk, 122.
- Fruits, remarks on from the Detroit Journal, 85; on obtaining new varieties of, 113; on gathering and preserving, 122; summer, and fruit gardens, advantage of, 130; catalogue of those considered by the Mass. Hort. Soc., as worthy of cultivation, 250; tall, how best disposed of, 414.
- Fruit stealing, extract of the statute for punishing, &c., 54.
- Fruit trees, loaded, remarks on, 44; remarks from Van Mon's catalogue, 73; choice varieties alone should be cultivated, 165; remarks on pruning, 385; how rendered productive, 385; how preserved against mice, 395.
- Fuel, loss by using unseasoned, 348.
- Gage, Justus, on making butter in winter, 308.
- Gama grass, remarks on, 34, 42, 93, 206, 245.
- Gangrene, a cure for, 213.
- Gardener's work, 286.
- Gardens and orchards, on robbing, 19.
- Garget, remarks on, 422.
- Genista, or yellow flower, notices of, 22.
- Gervase Markham on transplanting white pines, 409, 410.
- G. H. recommends bleeding and salting cattle, and cutting off the tails of calves, 378.
- G. K. his queries relative to hedges, 244.
- Gloves, produced from hair combed from the back of a common cat, 158.
- Goat nurses, 190.
- Golden rules, &c., 356.
- Gooseberries, large, notices of, 31.
- Gordon, Alexander, on making torpid seeds vegetate, 125.
- Gould, Augustus A., on the locust, 417.
- Grafting, 315, 365.
- Grain preserved from the weevil by stacking it round a green pole of sassafras, 30.
- Grapes, raising of in Charlestown, 107; low training of recommended, 149; large, notice of, 220; new and valuable variety of, 252; preserved by John Rupp, 259; preserved in saw dust, 261; varieties of, 331.
- Grape vines, remarks on pruning, &c., 1, 77, 156, 220; on the summer management of, 37; Dr. Thatcher's observations on, 156; those vines farthest from the ground, suffer most by mildew, 203; means of rendering more productive, 332; native recommended, 361.
- Grass cloth, notice of, 205.
- Grass land, on recruiting, 337.
- Grass seeds, sowing of, remarks on by W. Claggett, 307; not enough usually sown on an acre, 334; further remarks on, 349.
- Grindstones on friction rollers, 417.
- Gumption, explanation of, 272.
- Gypsum, its utility as a manure, 18; proper time for sowing, 52; remarks on, 195.
- Happiness, in what it consists, 104.
- Hard water, how rendered soft, 373.
- Harmon Lawson, Jr., on keeping bees in a garret, 34, 259; on the harvest in Wheatland, 42; large crop of wheat raised by, 100.
- Harrow and seeding machine, 18.
- Hats, a chapter on, 32.
- Hay, fraud in packing, 319.
- Hayward, Joseph, on earthing up potatoes, 105; on preparations for watering peach trees, 105.
- Haymaking, 350, 414.

COMMUNICATIONS.

For the New England Farmer.

ON THE FAILURE OF WHEAT CROPS IN NEW ENGLAND.

MR. EDITOR, No one can peruse the writings of Dr. Dwight, on any subject, without pleasure and profit. Yet his pen may have erred, when writing upon subjects upon which he was not practically conversant; and the errors, as well as the virtues of great men, have an imposing influence on society. The same motive, that of doing good to others, which prompted the Doctor to suggest the cause of the failure of the wheat crop, in modern times, in New England, induces me to call in question the correctness of his theory.

Doctor Dwight ascribes the failure of the wheat crop to the deleterious influence of animal manure or stable and yard dung, which induces plethora in the plant, or an excess of sap in the culm or stock, and which, not finding a ready passage in warm and damp weather, ruptures the sap vessels, flows out upon the surface, becomes acrid, corrodes the straw, induces rust, and finally blasts the grain. His reasons for this belief are, that lands which produced wheat formerly, as Northampton flats, will not produce it now; that new lands yield wheat perfectly well in most parts of the country at the present time; and that lands dressed with gypsum, lime, ashes or fish, yet produce good crops. Either, then, dung is the cause of blast, or the ashes, fish and lime, afford to the wheat a more pabulum, which the soil did not before contain. The Doctor adopted the first opinion, I think erroneously.

That he has accurately described a cause of rust I readily believe; but I do not know, nor can I think, that the blasted wheat crop is *always*, or *commonly*, marked with this disease; or that a failure happens only when the soil has been recently dressed with animal manure. The bad effects of a heavy dressing of dung, especially when applied to wheat grounds in an unfermented state, by causing a too luxuriant growth of straw, and inducing rust, are well known to the wheat farmer; and hence it is a general practice with them, either to apply the long manure to the previous crop, as corn or potatoes, or to apply it after it has undergone the fermenting process. The wheat crop, I am confident, is not prejudiced by a moderate dressing of dung under either of these modifications. Again, if animal manure is the cause of the failure of the wheat crop, why does its application not produce a similar effect in the wheat districts of New York, Pennsylvania, Maryland, Virginia, &c. where these manures are as extensively used as they are in New England? Like causes produce like effects, and if dung is deleterious to the wheat crop in New England, it must be equally deleterious in the adjoining state of New York. And yet we have heard no complaint of this kind from the latter state. Doctor D. speaks of the Pennsylvania practice of using lime; yet according to Dr. Darlington, who resides in the liming district, this mineral is there applied to grass and corn, and seldom if ever to the wheat crop. [See proceedings of N. York State Ag. Soc. 1833, pp. 28, 30.]

The true cause, I suspect, of the uncertainty of the wheat crop in New England, is a want of the specific food of the plant—in the soil. New England, with trifling exceptions, is a primitive formation, deficient in some of the elements of wheat, particularly nitrogen. New lands may afford these elements for a time, from the animal matters which centuries have accumulated upon their surface. The atmosphere, it is true, contains nitrogen, one of the properties of animal matter; but philosophers deny that plants, generally, possess the power of abstracting it for their wants. There are districts in New York, New Jersey, &c. which will not yield good wheat. There are plants peculiar to the primitive formation, which can never be made to thrive well in transition or secondary formations, and vice versa. The lime, the ashes, and the white fish, the application of which to the soil the Doctor thinks has induced good wheat crops, may contain the specific pabulum of that grain. Bones, horns, slaughter-house manure and the urine of animals also contain it; but I question if it is to be found in the ordinary contents of the cattle yard, in the ordinary mode of management.

Not being myself located on a primitive formation, I have not the opportunity of testing the correctness of my hypothesis by practice; but the question may be readily solved by any farmer in New England, who will apply any of the manures I have enumerated, as containing the specific food of wheat, to a part of a field, and sowing the whole field with this grain. B.

For the New England Farmer.

PRUNING GRAPE VINES.

To the Editor of the N. E. Farmer,

SIR, In perusing the writers on the cultivation of the grape, I find that no one has prescribed any particular mode of culture for the native vine. I should hope that amongst your numerous patrons some one can give an accurate account of the best mode of culture—especially as to the pruning of them, if they are pruned as the foreign grape, yearly. This is what I wish to know: and this information, or any other on the same subject, will much oblige

A FRIEND TO HORTICULTURE.

Cattskill, July 4, 1833.

By the Editor. Mr. S. Vose, of Macon, (Geo.) in a letter to the Editor of the N. E. Farmer, observes, "I am much inclined to believe that nearly every foreign kind [of grape] will in a few years be abandoned, unless cultivated for variety or curiosity. The natives are much the most thrifty, produce the largest quantity of fruit, and are least liable to rot. The kinds most easily cultivated, and preferred, are the *Catawba* and *Bland's Madeira*. The *Isabella*, though with us liable to some objections, produces very abundantly in favorable seasons; the Warrenton grape succeeds better than any other foreign variety. All these kinds produce a very considerable crop the third season after planting. In a vineyard of that age, last season, I saw three distinct crops on nearly every vine, which appeared to be entirely the result of a proper system of pruning, which was as follows:—At the winter pruning the vines were cut quite low, generally 12 or 15 inches from the ground.

After a proper number of shoots had put forth, and the fruit had attained the size of a bird shot, the vine was cut off beyond the third eye from the fruit; from one of these eyes another shoot was allowed to spring, which soon produced fruit; the branch was then cut as at first: a third put out and also produced fruit. Each of these successive crops was as large or nearly so, as the first; and the fruit matured before frost." See likewise Mr. Fosdick's Observations on Horticulture, New England Farmer, vol. x. p. 323, 330.

For the New England Farmer.

PROTECTING TREES AGAINST MOLES, &c.

MR. FESSENDEN, Will you, or some of your correspondents, have the goodness to inform the public if some kind of a wash may not be applied to trees, so as to protect them from those little quadrupeds usually called Moles or Field Mice. Many plans have been suggested, and many experiments tried, to prevent the ravages of the cankerworm; but it is a fact, which we are called to witness every spring, that these troublesome animals are much more destructive to fruit trees than the cankerworm. Any gentleman who is in possession of any cheap and effectual remedy, will confer a favor by communicating it to the public.

Yours truly, G. H. D.

Hampton Falls, July 8, 1833.

By the Editor. There are two methods of preserving fruit trees against the ravages of moles and mice. The one is to destroy the animals, the other to protect the trees, &c. against their depredations. With regard to destroying them, the following among other recipes have been recommended.

"Take one quart of oat meal, four drops of oil rhodium, one grain of musk, two nuts of nux vomica powdered. Mix the whole together, and place it where the rats frequent, and continue to do so while they eat it, and it is said it will soon destroy them."

Another recipe, still more simple, we have heard recommended; but have not tried it. Take equal quantities of unslacked lime and powdered oat meal; mix them by stirring, without adding any liquid, and place a small quantity in any place infected by rats, mice, or moles. The vermin will swallow the preparation, become thirsty, and the water which they drink will cause the lime to swell and thus destroy them.

A mode of preserving young trees against being injured by rats, rabbits, &c. would doubtless answer against moles: it is somewhat troublesome, but may answer when nothing better occurs. Take any quantity of tar, and six or seven times as much grease, stirring them well together. With this composition brush the stems of young trees as high as the vermin can reach, and it will prevent their being barked. Mice frequently destroy trees in nurseries by gnawing off the bark beneath the surface of the snow. An application of the kind above mentioned, just before winter sets in, will, no doubt, prevent their depredations. Another method is to tread down the snow when it has recently fallen around the stems of trees, which prevents the access of the spoilers to the trees near the surface of the ground, where they do the mischief.

From the Genesee Farmer.

HINTS TO FARMERS. No. IX.

ON leaving the paternal roof, to seek my fortune in the wide world, when about 18 years of age, my father gave me this parting admonition: "My son, take care always to *let well enough alone*." The occasion served to impress the advice deeply on my mind, and amid the diversified scenes of the subsequent thirty-five years, it has seldom been forgotten; and I have reason to believe it has had a very salutary influence upon my prosperity and happiness. It has afforded, withal, something of a standard by which to gauge the indiscretions of others. How often has a disregard, in others, to this maxim, reminded me of the Italian epitaph: "I was well, wished to be better, took physic, and here I am." The true philosophy of happiness is to depend on one's self for the blessing—on the lively exercise of the virtues which can alone confer it. The man who is industrious and frugal, and who scrupulously fulfils the relative and social duties, whatever be his condition or profession, stands the best chance of enjoying a goodly portion of the comforts and pleasures of life, and of perpetuating in his children his habits and his virtues. While he who would live by the industry of others, or who expects to find happiness in the frail applause which wealth or ostentation may extort from those around him, seldom succeeds in his desires.

Tom Tape was my schoolmate. Tom had rather high notions from his boyhood; and persuaded his father to put him to a merchant. In due time Tom became the master of a shop of goods, was attentive and fortunate, and acquired a snug estate. Had he *let well enough alone*, he might now have been the head man of our town. His pride got the better of prudence, and persuaded him that he might *do better* at New-York. He went there, figured as a *wholesale* merchant, for which neither his capital nor his experience were adequate, for three years, and then came the notice in the state paper for his creditors to show cause, &c.

Tjerck Wessel's farm joined mine. He was one of our best farmers, and understood the value of "*come boys*," as well as any one. Good luck was so constantly by his side, that he considered that any man might get rich who had a mind to. Yet he could not *let well enough alone*—he wished to *do better*. He therefore removed to the village and opened a tavern, and had the promise of the Justice courts and of the stage custom. "*Go boys*," did not improve the farm, and it soon became neglected and unproductive. By and by, the courts were removed by law, the stage went to the new hotel, and the temperance era wound up the tavern business. Tjerck had got back to the farm, with habits very much altered, and his fortune not a little impaired. Yet he consoles himself, that he is not half so bad off as

Joe Sledge, once our master blacksmith, afterwards a merchant, and now a journeyman. Joe was so famous for his edge tools, that people came to him from all parts. He had his journeymen and his apprentices, and was always present to oversee them, and to be seen by his customers, as all master mechanics ought to be. Joe got rich, because he was adapted to his business, and his business adapted to him. Joe thought, with Sam Patch, that some things could be done as well as others—and that because every body liked him as a blacksmith, they must like him as any thing else,

forgetting that it was his *trade*, and not his mind or his person, which had brought him into notice. And as *merchant* was rather more respectable than *mechanic*, and withal a more tidy employment, he in fact sunk the blacksmith, and became a dealer in tapes and sugars. It fared with Joe as it generally does with others who embark in new business, of which they know nothing, after they have arrived at mature manhood. Those who had been bred to the business, proved successful rivals, and the sheriff finally closed his mercantile concerns, by selling the entire effects of "a merchant unfortunate in business." Joe insists to this day, that if he had *let well enough alone*, he might have been as well off as the best of his neighbors.

Time would fail me to narrate half the cases which have come under my observation, of men abandoning steady habits, and fair prospects of wealth, in the employments in which they had been educated, and in which they were best calculated to succeed, for the very hazardous chance of doing better in business in which they had every thing to learn. The fascinating charms of fashion and show, the ostentatious pride of wealth, and the alluring smiles of office, are as bad as were the syrens of Calypso, to beguile men from the paths of true happiness. The moderate but certain gains which are the reward of industry and frugality, are the most abiding in their nature, and most benign in their influence. It is the mild early and latter rains which induce fertility, and cover the earth with fruitfulness; while the tempest and its floods cause waste and desolation. The mushroom grows up in a night, and withers in a day.

The farmer should be the last to be dissatisfied with his condition. Of all classes he is the most independent. He produces within himself more of the necessities and comforts of life than any other class. If he does not find the elements of happiness on the farm, his search for them elsewhere, I fear, will be in vain. But he must not forget that it is the province of the *mind* to arrange and combine these elements; and that it becomes qualified to perform this office, in proportion as it is enlightened and cultivated. The mind, like the garden, will yield the most grateful fruits when nurtured with care; and few have more opportunities, or are better requited for their labors, in cultivating both, than him who thrives by the plough.

B.

From the Columbia Sentinel.

ON RAISING GOOD CROPS OF WHEAT AND INDIAN CORN.

THE introduction of Gypsum or Plaster to aid the germination and growth of Clover, has produced nearly as great and desirable a change in farming, as the introduction and use of Steam has in the navigation of our streams. Both have been sources of developement of powers with which we were recently unacquainted, and whilst the one has fertilized and is fertilizing our fields, the other is adding to our span of life, because it enables us to accomplish more. Strange as it may seem they are mutual aids; for whilst the first causes the earth to yield of her abundance, the other gives a quick transit of that abundance to places from whence we are to expect the most ample returns. Gypsum furnishes us the means of bringing land into a high state of cultivation, and of producing a rapid succession of crops which are constantly improving. Experience, the guide of the farmer, has long since established the fact, that a good

Clover ley, well turned under, is as sure to give a good crop of either Wheat or Corn as it is almost possible for the farmer to insure, with all the uncertainties that are incident to his occupation, and are likely to lessen his produce. The addition of stable manure is not considered essential to insure a crop, and will hardly, on some soils, compensate the farmer for the labor and expense of its application where Plaster has been freely used. The point I wish to establish is this—that, with suitable management, a good crop of Clover will insure a succeeding one of grain, whatever it may be, if the soil is carefully turned over and the tilth permitted to remain undisturbed, so that it may afford food for the plants that follow. But with the growing grain, neither grass nor weeds must interfere, and rob the earth of the sustenance which has been prepared with so much expense, labor and care. The crop must have the whole of it; and to permit either grass or weeds to grow is evidence of bad farming and consequently bad policy. The best fields of Wheat, and there are many of them, which are now growing in this vicinity, have been prepared in the manner before stated, and their promising appearance is abundant evidence that the course which has been pursued is a correct one. It is but lately that it has been adopted; and I have often been forcibly struck with the very perceptible improvement, not only in the quantity raised, but in the quality which has followed the practice. It is demonstrative proof that we have become better acquainted with the appetencies of the plant, and furnish better supplies of the food it requires for its growth.

Another fact I have repeatedly noticed, and have frequently seen most strikingly exemplified; and that is, that once ploughing of a Clover sod is better than oftener. I have this year two lots by the side of each other—the soil is the same—both were in Clover last season and pastured—one was only once ploughed, the other twice, and both put down to Wheat. The difference now in the appearance of them is nearly one half in favor of the lot ploughed once. The same fact, under exactly similar circumstances, occurred to me last year. I was aware before, that ploughing once was better than oftener; but I thought I had particular reasons for departing from the rule—the result however was the same. The observant farmers in this section of country, guided by experience, endeavor as much as possible to conform to this rule. But it is indispensable to a good crop of Wheat that your land should be clear of the Couch or Quitch grass, and likewise blue grass. It is the same with Corn; but then what with ploughing and hoeing between the plants, you have a better opportunity to subdue it. I would ask our farmers to point out the best method of destroying Quitch grass. It is becoming very troublesome; at the same time it is extremely detrimental to the growth of wheat. I will only add that Clover, besides insuring a good crop of Wheat and Corn, is valuable for hay. For draught-horses and sheep it is superior to any other, as it keeps them in finer condition. Of this I have an experience of at least fifteen years. But for feeding cattle it is not so profitable as other hay. A.

A man in Alabama is under sentence of death for passing a counterfeit Mexican dollar. The rigor of the laws in that state is the subject of much newspaper discussion.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION AT THE MASS. HORT. SOC. ROOMS.

Saturday, July 13, 1833.

FRUITS EXHIBITED were of a good quality and of choice kinds.

From Messrs. WINSHIPS, Currants of thirteen kinds—No. 1. White Antwerp; 2. Red, do.; 3. Rose colored, do.; 4. Spanish white, very large; 5. White Champagne; 6. Wilmot's red Seedling; 7. Brown's white Seedling; 8. New white, largest clusters and berries; 9. Grizley; 10. New red grape; 11. Morgan's red Seedling; 12. Black Naples; 13. Black English grape. All recently imported by them, and chiefly of new varieties, and of extraordinary size and beauty; grown in the Nursery under common cultivation.

CHERRIES. By Dr. L. WARD, Roxbury, very fine native Cherries. By Dr. L. B. Adams, Bigreau, Harvey Heart Cherries.

By Mr. SPARHAWK, Brighton, American white Raspberry, wanting in flavor.

By Mr. W. WHITMARSH, Brookline, 3 bunches white Chasselas Grapes; one bunch weighed 9 oz.

By THOMAS MASON, Charlestown, fair grapes, not quite ripe.

GOOSEBERRIES. S. WALKER, Lady of the Manor; Waiting Maid; White Smith; White Eagle; Medal; Sir John Calgrove; Crown Bob; Huntsman; Thrasher; Lancaster Lad, weighed 12 pennyweights, 13 grains; Top Sawyers; Roaring Lion; Elijah; Savining, 6 weighed 3 oz. 16 pennyweights; Angler; Hero; Golden Lion.

JOHN A. KENRICK, Newton; Gooseberries; Green Mountain; Roaring Lion; Bangup, 6 weighed 2 oz. 16 pennyweights, 9 grains.

Mr. ABEL HOUGHTON, Lynn, yellow walnut Gooseberry, of excellent flavor.

Our season for fruit is approaching, and as there is a prospect of large crops and new varieties, it is hoped that all rare kinds and good specimens will be presented at the Hall, with the names, by the cultivators. Cards will be in the hands of the Librarian, so that each individual can label his own fruit, which will prevent mistakes and confusion.

In behalf of the Committee, S. A. SHURTLEFF.

Messrs. Z. COOKE, E. VOSE and T. G. FESSENDEN, were a Committee to choose an Orator for the next Annual Celebration of the Massachusetts Horticultural Society.

From S. WALKER, Roxbury, Hyrenthrum portulacium pl., Carnations and Picotees, Campanula alba plena, Verbascum, &c. &c.

THOMAS MASON, Charlestown Vineyard, Dahlias varieties, Carnations and Herbaceous plants.

Mr. HOVEY, Cambridgeport, some fine specimens.

R. WARD, Roxbury, flowers, one kind of which, the Echinops spherocephalum attracted much attention.

Messrs. WINSHIP, Pinks, Carnations, &c.

Per order, JON. WINSHIP.

Cholera. The Lexington (Ky.) Gazette of the 22d June, contains the names of the individuals ascertained to have died of the Cholera. There have been about 400 deaths, and the population of Lexington is about 6000; consequently the deaths have been one to every fifteen of the population. Business of all kinds appears to have been suspended, and for two weeks no paper was issued from the office of the Gazette.

LOCUST TREES ON LONG ISLAND.

FOR some ten or twenty years past the attention to this valuable tree has been constantly increasing in many parts of the Island. It is now quite common to see them not only occupying the lanes, avenues and yards, about the residences and out-buildings, but whole fields. They are propagated in various ways, but generally by ploughing among them, thus causing them to sprout from the broken roots. Some farmers begin to sow the seed, and cultivate them with corn and other crops that require the ground to be enriched and frequently stirred. In the spring, while in bloom, the air is literally fragrant with their perfume. From locust trees alone the value of property on the Island is increasing, and will continue to increase.—N. Y. Farmer.

MANURE IS WEALTH.

IN our intercourse with some of the farmers residing within forty or fifty miles from New-York, on Long Island, we have been surprised at the instances related to us of the profitableness of farming. Some farmers, known to have labored and toiled hard, have continued yearly to fall in arrears until they have commenced buying manure. Fifty-six cents are given per carman load at the landing, for the apparently worthless dirt swept from the street. This applied at the rate of twenty loads produces wealth. The very farmers who could not obtain a living by using only manure made on their farms, have, in a very few years, not only freed their farms from incumbrances, but purchased others in addition, and are now, from the yearly profit of their farms, putting money out at interest. If then it is found so profitable to buy manure, and be at the various expenses attending the carting, how very important is it to give special attention to increasing the quantity and improving the quality of that made on the farm. There is no question but that almost every farmer can double the quantity of his domestic or yard manure, without scarcely any additional expense. It is thought too, that at least fifty per cent. of the nutritive properties of yard manure are lost by drenching of rain, excessive fermentations, and injudicious application to soil. The more we consider this subject the greater does it become in importance, and justly regarded as the primary object in farming.—N. Y. Farmer.

From the Columbia Telescope.

SODA WATER.

WE know nothing that we can in this weather, more appropriately offer to our readers than the following method of preparing that very cheap, healthy and refreshing drink, soda water.

Take 20 grains of Tartaric acid: 25 grains of super-carbonate of Soda: dissolve a lump of sugar, on which you have poured one drop of oil of Lemon in two wine glassfulls of water: add the Tartaric acid: stir it till dissolved. Then dissolve the carbonate of soda in a like quantity of water, and pour the two solutions quickly together; toss them off as rapidly as possible.

Ice, or the coldest spring water, is necessary to give the above form its most perfect success. We would advise that the glasses be previously cooled. Any other syrup may be used, that one prefers to Lemon.

Super-carbonate of Soda and Tartaric acid may be bought, in Charlestown, for about \$1.25 per lb. This preparation is good; and does not cost more than one cent per glass.

DOMESTIC SILK IN SOUTH CAROLINA.

WHEN on an excursion to the country a few days since, we found, much to our surprise and gratification, that some of our female friends had turned their attention to the culture of SILK, and that many of them had made such progress in this laudable experiment as already to have realized considerable profit from the production of the raw material, and manufacturing it into cloth. Mrs. Patrick Calhoun, of this District, who, among her other many excellent virtues, is remarkable for her industry and attention to her matters of domestic concernment, showed us, in a house she had fitted up for the purpose, at least, we would say, one hundred thousand silk worms, all healthy and busily engaged, some of them in forming the cocoon, and others fitting themselves for the production of that valuable material. Mrs. Calhoun, who had tried the experiment last year on a smaller scale than she is doing the present, assured us that she had no doubt, should no unforeseen accident occur, she would be able to raise silk enough by the latter end of August to manufacture more than a hundred yards of cloth.

We know two other ladies in this District, Mrs. Covington and Mrs. Baskin, who have been similarly engaged for several years, and we have seen some pieces of silk cloth manufactured by them, which, when worked up into clothes, makes a beautiful and lasting dress. The cloth manufactured by them sold at this place for \$3 per yard, and it is sought for with avidity, not only on account of its rarity, but also for its beauty, durability and cheapness. We hope that our ladies will turn their attention to this interesting, profitable, and laudable employment, and that we will be pardoned by those whose names we have given to the public, for having done so without their permission.—Abbeville Whig.

MECHANICAL INGENUITY

Is certainly an attribute of the American man. We have just seen a beautiful exemplification of it in a pin-making machine, invented by Dr. John I. Howe, of this city, who sails with it in a day or two for England, there to procure a patent for it.

The model machine is small, beautifully made and worked by hand. We saw it in operation; and from two sorts of wire with which it was fed—one stout for the pin, the other fine which was twisted into the head—we saw pins complete poured forth at the rate of 40 and with the capability of 60, in a minute. The pins are perfect in every thing but the coloring, which, as in all cases of pin-making, is imparted by a chemical wash afterwards.

The machines now used for pin-making, only make the pin, the head being afterwards put on by hand, to each separately. Here the head is more firmly, uniformly and smoothly made, and fastened on by mechanism. We cannot doubt that this all but reasoning machine will well reward its ingenious inventor.—N. Y. Amer.

The oldest member of Congress now living is the Hon. Paine Wingate, of Stratham, N. H. He was of the first Congress held in New York, under Gen. Washington's administration—is the eldest living on Harvard College catalogue, having graduated in 1758, 75 years ago. He married a sister of Col. Pickering, whom he buried a few years since. He still superintends his farm at the age of 95 years, is an old school gentleman, and wears his Revolution hat and ruffles.

ON THE CULTIVATION OF RYE.

BY JOHN KEELY.

To the Trustees of the Essex Agricultural Society—

GENTLEMEN, Having for many years past been more than commonly successful in raising large crops of winter rye by a process of cultivation which, I believe, is entirely new, I have been induced, by the suggestion of some gentlemen whose judgment I very much respect, to submit for your consideration a statement of the mode of culture, with the produce. And, that the success of the experiment this season may not appear to be altogether accidental, it will, perhaps, be as well to communicate the result of the process for the three or four previous years.

The land on which the experiment has been conducted is situated on the Merrimack, about a mile and a half east of Haverhill bridge; and came into possession of my father in 1827. The soil is a sand, approaching to loam as it recedes from the river. Perhaps the term *plain land* (by which it usually passes) will better convey an idea of the quality of the soil. It is altogether too light for grass. The crops we find most profitable to cultivate on it are winter rye, Indian corn, potatoes, and to some extent turnips. Oats might probably be raised to advantage, were it not that the land is completely filled with the weed commonly called charlick, which renders it entirely unfit for any spring crop, excepting such as can be hoed. The crops of rye, on the neighboring soil of the same nature, vary, I believe, from seven or eight to twelve or thirteen bushels per acre, according to the cultivation, and their approximation to the river. We usually raise on land from thirteen to thirty bushels of Indian corn per acre. Potatoes are very good in quality, but the quantity is quite small; not sufficient to be profitable, were it not that the land is very easily cultivated.

In the summer of 1827, we sowed three bushels of winter rye near the river, on about two acres of land, which produced twenty-eight bushels.

In 1828, we sowed four bushels on four acres of land running the whole extent of the plain from the river. This piece was sowed in the spring with oats; but they were completely smothered with charlick, and about the middle of June, the whole crop was mowed to prevent the charlick seeding. By about the middle of August, a second crop of charlick having covered the land, it was ploughed very carefully, in order completely to bury the charlick; and then suffered to remain until the 15th of September, when we began sowing the rye in the following manner. A strip of land about twelve yards wide was ploughed very evenly, to prevent deep gutters between the furrows, and the seed immediately sown upon the furrow and harrowed in. Then another strip of the same width, and so on until the whole was finished. We found the oat stubble and charlick entirely rotted, and the land appeared as if it had been well manured, though none had been applied to this part since it had been in our possession. The rye sprung very quick and vigorously, having evidently derived great benefit from being sown and sprouted before the moisture supplied by the decaying vegetable matter in the soil had evaporated to any considerable extent. This crop produced 133 bushels.

In 1829, the charlick was suffered to grow on the land appropriated to rye, until it had attained its growth and was in full blossom. The land was then ploughed very carefully, and the charlick

completely covered in. In a short time a second crop appeared more vigorous than the first. This also was allowed to attain its growth, and then ploughed in as before. A third crop soon appeared, which of course was destroyed, when the land was again ploughed for sowing about the middle of September. This piece of land was a parallel strip running from the river, and containing two acres. Two bushels of rye were sowed. The crop presented a remarkably promising appearance, and yielded seventy-four and a half bushels.

In 1830, the land appropriated to rye included nearly all the lighter part of the soil, and owing to a pressure of business was not attended to as we could have wished. It was ploughed in the early part of the summer. But harrowing to destroy the weeds was substituted for the second ploughing. This, and the unusual blight which affected all the grain in this part of the country, led us to anticipate a small crop. It yielded, however, fifteen bushels to the acre.

The land on which the crop of rye was raised the present season had for three or four previous years been planted with Indian corn: and owing to the extent of our tillage land, we have not been able to apply more than four or five loads of manure to the acre this season. The charlick was suffered to attain its growth as usual; and on the 18th and 19th of June it was carefully ploughed in. The second crop was ploughed in on the 6th and 7th of August. On the 14th and 15th of September it was sowed in the usual manner, namely, a small strip of land was ploughed, and the seed sown immediately upon the furrow, and then harrowed in. Then another strip of land was ploughed, and so on until the whole was completed. One bushel per acre was sowed as usual. The seed was originally obtained from a farmer in this vicinity, and I suppose is similar to that which is generally used. We have never prepared our seed in any manner, but have directed our attention solely to the preparation of the land; and to this we attribute our success. Owing to the unusual severity of the winter, the crop was considerably winter killed, but recovered very soon in the spring, excepting in the midfurrows. There, as the land lies very level, the water settled, and so completely destroyed the rye that they continued bare the whole season. This would of course cause some diminution in the crop; perhaps a bushel or two. The rye was reaped at the usual season, and, as the weather was favorable, immediately put into the barn. The land contained one acre and thirteen rods, and yielded *forty-six bushels and three pecks. A remarkably fine sample.*

In entering a claim for your premium, I would ask your attention particularly to the process of cultivation. It is I believe entirely new, and capable of general application.

Sowing the seed immediately after the plough we consider very advantageous to the crop. The soil being then moist, causes the seed to spring immediately, and gives a forwardness and vigor to the plants which they ever after retain.

The process of ploughing in three crops of weeds before the seed is sown, very much enriches the soil. It would be altogether unnecessary to attempt to refute the notion, that by such a process nothing more is applied to the soil than was before derived from it. If one could not discover by the light which Chemistry has shed upon the subject of Agriculture, sufficient reasons for the contrary conclusion, observation, one would think,

would be sufficient to convince any intelligent man of the fact.

And here I would suggest, that I do not consider the experiment, as we have conducted it, quite complete. To render it more so, in the first place, in ploughing in the weeds, I would not turn a furrow after the dew had evaporated. I have no doubt but that a large portion of that fertilizing quality in the soil, which (during the summer months) is continually exhaled from the earth, is by the dew brought again within our reach, and it would be wise to avail ourselves of the opportunity of again burying it in the soil. And in the second place, I would by all means use a heavy roller after each ploughing. It would fill all the cavities left by the plough, and by pressing the soil more closely to the weeds, at once hasten their decomposition and very much retard the evaporation from the soil.

But the land is not only very much enriched by this process. There is, I conceive, no method by which it can be so effectually cleaned. Three times during the season a fresh surface is presented to the atmosphere; and each time, as the decaying vegetable matter increases in the soil, so is the exciting cause augmented to make a more vigorous effort. We have in this manner gone over nearly all our land which is infested with charlick, and the diminution of the weeds is quite sufficient to warrant the expectation, that in a few years it may be comparatively eradicated.

Very respectfully, JOHN KEELY.

Haverhill, Sept. 22, 1832.

The undersigned having assisted in measuring the rye, an account of which is given above, hereby certify that the quantity is as there stated, namely, forty-six bushels and three pecks.

JOHN KEELY,
THOMAS E. KEELY,
SAMUEL THOMSON.

I have this day measured a lot of land belonging to Mr. Keely, on which is a crop of rye, and find it to contain one acre and thirteen rods.

C. WHITE, Surveyor.

Haverhill, Aug. 1, 1832.

At a Meeting of the Trustees of the Essex Agricultural Society, January 1, 1833, the foregoing statement having been read and examined:

Voted, That the first premium offered for the cultivation of rye be awarded to Mr. Keely.

Attest, J. W. PROCTOR, Secretary.

LABOR.

WHEN we read the lives of distinguished men in any department, we find them almost always celebrated for the amount of labor they could perform. Demosthenes, Julius Caesar, Henry the Fourth of France, Lord Bacon, Sir Isaac Newton, Franklin, Washington, Napoleon,—different as they were in their intellectual and moral qualities, were all renowned as hard workers. We read how many days they could support the fatigues of a march; how early they rose; how late they watched; how many hours they spent in the field, in the cabinet, in the court: how many secretaries they kept employed; in short, how hard they worked.—*Everett's discourse.*

COAL.

SEVERAL gentlemen in Thomaston have commenced exploring for coal, and have already reached the depth of sixty feet. The Republican gives some reasons why they will probably be successful.

THE SEASON, &c.

THE weather in Quebec has been much the same as with us. *Neilson's Gazette* mentions that it had continued very unsettled, and by no means favorable to the growing crops. "Since Saturday evening the weather has been rainy, and since last night, cold, with easterly wind. The health of the city and neighborhood continues good."

The Crops in Lower Canada, June 1833. The early part of the month of May was like the preceding one, very cold and wet, and the season backward, so that planting progressed slowly until nearly the middle of the month, from which time great exertions were made to finish putting potatoes in the ground, but even up to this time (1st of July) considerable quantities still remain to be planted. The consequence is, the dressing of potatoes will take place during the hay and harvest, which will cause much additional expense and trouble to the framers. Wheat has a tolerably flourishing appearance on many farms, although it is stated the large white grub has destroyed some fields almost entirely; and on wet low land, wheat has a very poor appearance. Oats look very fine, and do not appear to have been so much hurt as other grains by the heavy rains. Barley, on dry up field lands, is fine; but on damp low lands, it has met with the same fate as other grains, poor and short; in fact, nothing but weeds appear to profit by cold rainy weather. Peas and Indian Corn are almost a total failure, excepting on new cleared lands. In the May report we stated that hay had a promising appearance, which we are sorry to say does not hold good at present, as almost every one is complaining of the crops (particularly on old meadows) being uncommonly light; indeed, many state they will hardly be able to cut them at all. It is wonderful how much hay has been affected by the cold and wet this spring; even natural meadows, *gros foïn*, are very light, so that betwixt pea straw, corn stalks, and short hay, we may expect to be at least one third or one fourth short of the bulk of last year. Pastures are excellent, and the stock in good condition. Hops are said generally to promise an excellent harvest. The caterpillar, with a smaller sort called by the Canadians the *arpenieur*, from its mode of creeping, has totally destroyed fruit trees over a great part of the country.—*Montreal Herald*.

This summer has been attended with more rains than are usually experienced in Canada; and for some time serious fears have been entertained that a very injurious effect on the crops would be the result. Since Tuesday, however, the wind has set in steadily from the south west. The barometer has risen slowly, and the air has been cool and favorable for vegetation. Some pieces of low lying land have suffered considerably. Peas are generally injured, and Indian corn is a failure; but in all other grains, there is every reason to expect that should the present favorable appearances of good weather continue for a short time, we shall have a good average crop.—*Montreal Courant*, June 29.

Apple Blossoms. A friend last week shewed us two bunches of apple blossoms he plucked from a tree in the meadows. By the side of them were apples larger than a hen's egg. Blossoms not unfrequently are seen in the fall, but at this season of the year, they are rare and unusual.—*Northampton Courier*.

From the Columbia Telescope.
FLOUR.

THE following result of a scientific investigation is likely to be exceedingly important. The facts were exhibited in one of the late sittings of the French "academie des sciences."

"Economical researches relative to the bran or hull of wheat and other bread stuffs, by Dr. Herpin. The author gives the results of his researches in the following propositions:

1st. That the envelope or cortical part of the wheat forms at least one twentieth of the weight of the grain.

2dly. That nevertheless, by the customary mode of grinding, wheat produces one-fourth of its weight in bran.

3dly. That about 25 per cent. of the nutritive substance of the grain is left in the bran.

4thly. That by simple washing, there may be drawn from the bran one half its weight of the first quality of flour, or oat-meal, according to the nature of the grain.

5thly. That there may, by this mode of proceeding, be made from grain at least 15 per cent. more bread than is at present obtained; that is, from the same quantity of grain now used in France, there might be had three millions of killograms of bread per day, more than is now obtained."

PARTIAL EXPERIMENTS.

Wood ashes, both dried and leached, have long been recommended as tending to injure and destroy insects in the soil. We have heard of a farmer, who has been in the habit of using ashes extensively as manure, declaring his intention of discontinuing the use of them altogether on his farm, being convinced that they tend greatly to increase insects and worms injurious to crops. It is very questionable whether this farmer has taken into consideration all the circumstances that are requisite to draw his conclusion. It is very probable that causes, such as the state of the seasons, the changes in the soil by other agents, an unusual prolificness of insects, or the introduction of other grains and grasses, and a thousand other things, may have produced the effect attributed to ashes. It is owing to such partial and deficient experiments that so much contrariety of sentiment exists among farmers.—*N. Y. Far.*

IMPROVEMENTS.

The Capabilities of Machinery. In the single but important article of Cotton, one man can now produce two hundred times more goods in a week than he could in 1760, when George III. ascended the throne. One mill in Manchester can, when all the spindles are at work, spin as much cotton thread in a week as would go round the world. In the manufacture of hosiery, which is seated chiefly in the midland counties of Nottingham, Derby and Leicester, machinery has reduced stockings one hundred per cent. compared with what they were twenty years ago. Owing to machinery, lace, which was 2s. per yard eight years ago, may now be bought for 4d; what was £4 10s per yard twenty years ago, is now 18d; and some kinds may be bought as low as one farthing per yard!

Woollens have experienced less reduction in price than any other kind of wearing apparel. At a paper manufactory in Hertfordshire a quantity of pulp can, at a distance of twenty-seven feet from the cistern in which it lays, be converted in three

minutes by machinery, into a sheet of paper, ready to be written upon! Such is the continual advancement made in the Manchester manufactures by machinery, that the trade say, if a manufacturer were to leave manufacturing for a few years, he would be quite lost upon returning into it again.—*London Merc. Jour.*

The Lime or Linden Tree is now in most places in its greatest grandeur. For foliage and perfume of blossoms, few if any of the ornamental trees will compare with it. Those who have a taste for beautiful foliage and flowers will be well paid by examining the Linden Tree at the west end of Sweetser court, on Washington street, or that on the estate of B. Bussey, Esq. Arch street, while in their prime.—*Advocate*.

The Author of Junius. The Belfast (Ireland) Whig of the 9th ultimo, contains the following:

"Lord Grenville, now very old, is seriously indisposed. On his death the secret respecting the author of Junius' Letters will be disclosed—his lordship having long been in possession of it. The documents are at Stow, the seat of the Duke of Buckingham, who is also ill."

CONTINENTALS.

The number of regulars furnished to the Revolutionary Army were—

| | |
|-------------------------------|---------|
| By New England, - - - | 117,441 |
| By the Middle States, - - - | 56,571 |
| By the Southern States, - - - | 56,997 |

It appears by the above, that New England, consisting of New Hampshire, Massachusetts, Rhode Island and Connecticut, furnished more troops for the defence of her country, than the other nine States, by 3,872. The number of troops furnished by South Carolina was 6,447—by Massachusetts, 67,907—Georgia 2,697—Connecticut, 31,939! New England lost more men in defending South Carolina against her tory citizens, than S. C. raised during the whole war!—*Vi. Rep. and Jour.*

ANECDOTE.

The following anecdote is related in the London New Monthly Magazine for last month:

"In that inglorious attack on Buenos Ayres, where our brave soldiers were disgraced by a recreant general, the negroes, slaves as they were, joined the inhabitants to expel the invaders. On this signal occasion, the city decreed a public expression of their gratitude to the negroes, in a sort of triumph, and at the same time awarded the freedom of eighty of their leaders. One of them having shown his claims to the boon, declared that to obtain his freedom had all his life formed the proud object of his wishes; his claim was indisputable; yet, now, however, to the amazement of the judges, he refused his proffered freedom! The reason he alleged was a singular refinement of heartfelt sensibility;—'My kind mistress,' said the negro, 'once wealthy, has fallen into misfortunes in her infirm old age. I work to maintain her, and at intervals of leisure she leans on my arm to take the evening air. I will not be tempted to abandon her; and I renounce the hope of freedom that she may know she possesses a slave who will never quit her side.'

FLIES EAT CHERRIES.

Those flies that are drawn to heaps of fish used for manure, are very fond of cherries, so much so as to consume all the cherries on a tree in a few days.—*N. Y. Far.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 17, 1833.

Cheese Making. The proper season for making cheese is from the beginning of May till the close of September, or in favorable seasons till the middle of October. Very good cheese, however, may be made in winter, provided the cows be well fed. The milk, according to Marshall, at the time of adding the rennet, should be from 85 to 90 degrees of heat, and about two hours time should be allowed for it to change into curd. In some dairies the milk is heated over a fire, to the proper temperature; but according to Marshall, the most approved practice is to mix boiling water in such a proportion as shall render the milk of a proper degree of heat to receive the rennet; this the thermometer should be used to determine.

The proportion of rennet to be used is differently stated by different authors, but a little experience will decide. The salt, according to the best authors, may be one ounce, fine, to so much curd as will make a cheese of fifteen pounds, and in that proportion for a greater or less quantity. During the process of turning the milk into curd it should be covered, so as to lose but little of its original heat.

When the coagulation has taken place the curd is broken or cut with a cheese knife, which causes the whey to rise through the incisions, and the curd sinks with more ease. After a short time the cutting is repeated, still more freely than before; and is continued until the curd is reduced to small uniform particles. This operation will require about three quarters of an hour; the cheese tub is again covered with a cloth, and is allowed to remain for the same time. When the curd has sunk to the bottom of the vessel, the whey is taken off with a dish after it is pretty well separated from the curd.

It is almost an invariable practice to scald the curd. The mass is first broken very fine, and then the scalding whey is added to it and stirred a few minutes; some make use of hot water in preference to whey, and it is in both cases heated according to the nature of the curd; if it is soft, the whey or water is used nearly boiling; but if hard, it is only used a little hotter than the hand. After the curd is thoroughly mixed with the hot stuff, it is suffered to stand a few minutes to settle, and is then separated as at the first operation. After the scalding liquor is separated, a vat, or what is often called a cheese hoop, is laid across the cheese ladder over the tub, and the curd is crumbled into it with the hands and pressed into the vat, to squeeze out the whey. The vat being filled as full and as firmly as the hand alone can fill it, and rounded up in the middle, a cheese cloth is spread over it, and the curd is turned out of the hoop into the cloth; the vat is then washed, and the inverted mass of curds, with the cloth under it, is returned into the vat and put into the press; after standing two or three hours in the press, the vat is taken out, and the cloth is taken off, washed, and put round the cheese, and it is replaced in the vat and in the press. In about seven or eight hours it is taken out of the press and salted, the cheese is placed on a board and a handful of salt is rubbed all over it, and the edges are pared off if necessary; another handful of salt is strewed on the upper side, and as much left as will stick to it; afterward it is turned into the bare vat without a cloth, and an equal quantity of salt is added to it, and the cheese is returned into the press; here it continues one night, and the next morning it is turned in the vat, and continues till the succeeding morning, and the curd is taken out and placed on the dairy shelf; here they are turned every day, or every other day, as the weather may be. If it is hot

and dry, the windows and doors are kept shut, but if wet or moist, the doors and windows are kept open night and day.

Cleaning the Cheese. The cheeses having remained about ten days after leaving the press, are to be washed and scraped in the following manner; a large tub of cold sweet whey is placed on the floor, the cheeses are immersed in it, where they continue one hour, or longer if necessary, to soften the rind. They are then taken out and scraped with a common case knife, with great care, so as not to injure the tender rind, till every part of the cheese is smooth; they are after the last operation rinsed in the whey and wiped clean with a coarse cloth, and placed in an airy situation to dry, after which they are placed in the cheese room. The floor of the cheese room is generally prepared by rubbing it with bean or potato tops or any succulent herb, till it appears of a black wet color; on this floor the cheeses are placed, and turned twice a week; their edges are wiped hard with a cloth once a week, and the floor is cleansed and rubbed with fresh herbs once a fortnight. They must not lie too long or they will stick to the floor. This preparation of the floor gives the cheese a blue coat, which is considered of great consequence.

Stilton Cheese—how made. The Stilton Cheese, which may be called the Parmesan of England, is not confined to Stilton and its vicinity, for many farmers in Huntingdonshire, and also in Rutland and Northamptonshire make a similar sort, sell them for the same price, and give them the name of the Stilton Cheeses.

Take the night's cream and put it to the morning's new milk with the rennet; when the curd is separated let it not be broken as is done with other cheese, but take it out, disturbing it as little as possible, and suffer it to dry gradually in a sieve; and as the whey separates, compress it gradually till it has acquired a firm consistence; then place it in a wooden hoop and suffer it to dry very gradually on a board, taking care at the same time to turn it daily with close binders round, and which must be tightened as the cheese acquires more solidity.

Parmesan Cheese. This sort of cheese was formerly supposed to be made from the milk of goats, but it is merely a skim milk cheese the curd hardened by heat, well salted, pressed and dried, long kept and rich in flavor from the rich herbage of the meadows of the Po, where the cows are pastured.

The process, according to Pryce, (*Bath Papers*, vol. vii.) is as follows:—the evening's milk, after having been skimmed in the morning, and standing till ten o'clock, and the morning's milk skimmed in about two hours after it is drawn from the cow, are mixed together. The mixture is then suspended in a cauldron, over a wooden fire as represented in the figure, and frequently stirred till it attains about 82 deg. of Fahr.; the rennet is then put in, and the copper taken from the fire, the coagulation quickly takes place, and the curd is afterwards worked with a stick till it is reduced to a small grain. The whey now occupies the surface, and a part of it being taken out, the cauldron is again

put over the fire, and raised to a temperature of about 145 degrees, or nearly a boiling heat. A little saffron is now added to impart color, the whole being all the while well stirred, and the superintendent examining it from time to time, with his finger and thumb, to ascertain the exact moment, when the curd shall have become suffi-

ciently solid. When this is the case, the cauldron is removed from the fire, and the curd allowed to subside; three fourths of the whey is then laded off, water poured round the bottom of the cauldron outside, to cool it, so as to admit of a cloth being passed below the curd, which is thus brought up and placed in a tub to clear. When drained it is put into a wooden hoop, and about half a hundred weight laid on it for half an hour; the cloth is then removed, and the cheese being replaced in the hoop, is laid on a shelf; here it remains for two or three days, at the end of which it is sprinkled over with salt; this sprinkling is repeated every second day for about thirty days if it be summer, and for about forty, or forty-five days if it be winter; after which no further attention is required. The best Parmesan cheese is that which has been kept for three or four years; but none is ever carried to market for sale, until it has been kept at least six months.

We have given the shape of the cauldron, and the manner of setting it as above, because it appears to us to possess advantages over the common mode of setting kettles, in taking less room, and presents more surface to the action of the fire in proportion to the contents of the vessel.

Transactions of the Essex Agricultural Society, for the Year 1832.

A large and valuable pamphlet with this title, was sent us sometime since, by a friend to whom we have often been indebted for similar acts of kindness. We should sooner have acknowledged this favor, but by accident the pamphlet was mislaid, and did not come into our hands till after most of the matter for our present No. of the N. E. Farmer was in type. A cursory view of the contents of this work has given us a high opinion of the publication, and we intend from time to time to make a free use of its treasures of agricultural information for the benefit of our readers.

ITEMS OF INTELLIGENCE.

CHOLERA. *The Cholera at Castine.*—A vessel has arrived, it is said, at Castine, from New Orleans, with the scourge of the world on board. Two have died on the passage, and one since their arrival at Castine. Our citizens should meet this disease with coolness and fortitude, if so be that we are to be visited. It is not our opinion that we are in immediate danger.—*Belfast Journal*.

From Maysville (Ky.) Monitor of July 4th, we learn that the cholera still continues in that place, though its malignity has considerably abated. The whole number of deaths is stated to be 53. In the same paper the following synopsis of deaths, in other places, is given.

In Flemingsburg, a population of about 700, there have been 63 deaths.

Maysville, a population of about 800—53 deaths.

Lexington—population of 6,500—400 deaths.

Paris—population about 1100—700 deaths.

Lancaster—about 600—12 deaths in 4 days.

Lawrenceburg—population of 200—40 deaths.

Millersburg—population of 400—200 deaths.

Cythinana—population 00—12 or 15 deaths.

Washington—population of 690—8 deaths.

Mayslick—population 400—7 deaths.

A letter of a late date from Valparaiso, received in this town, states that the cholera had not yet appeared at the Ports of the Pacific, but that the Scarlet Fever had been quite as destructive there as the Cholera has been in other parts of the globe. A tenth part of the population of Valparaiso, had been carried off by this disease in four months.—*Essex Register*.

Drilling to some purpose. Mr. Holt, of New York, who has for a long time kept a steam Engine employed in boring for water, has at length accomplished his object. His drill, having passed through 510 feet of rock, the surface of which was 130 feet below the ground, making a total depth of 640 feet, sunk suddenly into a depth of two feet of water, and it is believed that he will obtain not only enough for his own establishment, but for all the lower part of the city.

The treasurer of Charles River bridge has paid to the President of the Massachusetts Charitable Mechanic Association \$696 44, in aid of the Bunker Hill Monument fund, the same being one half of the nett amount of tolls received at the Bridge during the month of June. This would seem to indicate that the public do not feel much interest in the Bunker Hill Monument, so long as they remain uninformed as to the debts of the association, and the application to be made of the money.

Remarkable Willows. A friend assures us that there are now growing at East Boston two willow trees of the following extraordinary dimensions. One at six feet from the ground in the smallest place measures 13 feet 8 inches; at 2 feet from the ground 15 feet 4 inches. The other, at six feet from the ground, measures 12 feet 6 inches.

BOSTON FANEUIL MARKET, July 17, 1833.

Green Peas \$1, 00 per bus. String Beans 75 cts. Turnips 6 to 12 1-3 cts. per bunch; Cucumbers from 25 to 37 1-2 cts per doz; Early potatoes 57 cts to 100 per bush. Cabbages 50 to 75 cts per doz. Squashes 12 1-2 per doz. Onions, Beats and Carrots 6 cts. per bunch.

FRUIT TREES.
ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

NEW AMERICAN ORCHARDIST,
JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

TO SUBSCRIBERS.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half-bound and lettered, at 75 cents per volume, by leaving them at the Farmer Office. July 17

SPLENDID DAHLIAS.

THE Subscriber now offers about 500 most splendid and select varieties of the Dahlia, a large number of which are in pots and ready for immediate delivery. They have taken extreme pains to select only the most choice and magnificent from the largest collections of Europe, and those now concentrated constitute the *acme* to which this favorite flower has attained, the inferior varieties not being admitted in their catalogue. More than 150 of these kinds are *entirely new*—and having been introduced only the present year, *this is the first season of their blooming in our country, and the first time of their being offered for sale.*

In the collection there are 40 striped, variegated, mottled and shaded varieties, and a large number of the new kinds so remarkable for their beauty and brilliant colors. The color and height of every variety is designated in the catalogue; in addition to which the garden contains a *specimen bed of a thousand plants*, near one hundred of which already show their flower buds, thereby affording to every one the means of making selections from an inspection of their bloom.

The Catalogue is priced exceedingly low, and a discount of 25 per cent. is made when a dozen plants or more are taken. The following list constitutes a part of the varieties ready for delivery in pots, and the catalogue embracing the whole collection, will be forwarded to every applicant. The prices are mostly from 75 cents to \$1 each, and \$6 to \$9 per dozen; a few are higher priced. *Scarlet*—Young's Aurora, Panoply, Beauty of Sussex, Romulus, Eximia, Mount Etna, Highland Boy; *Crimson*—Bright Venus, Machin's superb, Well's Dwarf, Queen of August, Well's Aurora; *Yellow and Orange*—Queen of the Yellows, Well's Dwarf, superb straw color, Crocea superba, Orange bicolor, Von Weber, Lord Lyndhurst; *Purple*—Veitch's superb, Zelinda, superb dwarf, Bella, Young's Pilot, Delectum, Purpurea elata, Pule dwarf, Wheeler's Turk; *Black and Maroon*, coronation, decora, Premora, Sowerby, Mogul, black Turban, black Prince, Bronze, Vulcan; *Red*—Luna, Heroine, Adonis, Royal Sceptre, Montpelier; *Blush*—Modesta, New Blanda, Pomponne Blanche; *Lilac*—Lady Lacon, New Quilled, Grandiflora; *Shaded and Variegated*—Daphne, Levick's incomparable, Suprema, Crimson Velvet, Prince Eugene, Rosea Alba; *Anemone Flowered*—Tricuspidata, Brown, Scarlet, Iron Red; *Globe Flowered*—Feathered Light Crimson, Small Blood Red, Globe Orange, White, Superb white, Inwood's white, French dwarf white, etc.

It is desired that all orders be sent *direct by mail.*

WM. PRINCE & SONS, Flashing.

FOR SALE,

THAT valuable FARM, late the residence of Mrs. RUTH MACKAY, in Weston. It contains 110 acres of as good, and as well watered land, as there is within 100 miles of Boston. On 40 acres there is a thrifty wood lot of white oak and walnut, a fine young Apple Orchard which gained the premium of the Massachusetts Agricultural Society, a Peach Orchard, for which the Horticultural Society granted a premium on peaches, with all the new varieties of Pears and Cherries, Quinces, and other choice fruits, the farm is in a high state of cultivation, and enclosed with strong stone walls. There is a good house with 4 rooms on the floor, 2 kitchens. Barn, granary, chaise and wood house, cider mill. It is 14 miles from Boston on the great post road to New York, 1-4th of a mile from the road. The place has many advantages, both for the Farmer and the gentleman. It can be seen at any time by calling there, or on application to JOHN MACKAY, at 416 Washington-st. July 3 ew3w&ew9w

MISCELLANY.

A BRANCH OF THE MAPLE.

BY DAVID EVERETT.

LET the tall oak the bolts of heaven deride,
Or deal his mimic thunder on the tide;
Be this the theme of Albion's lofty muse,
An humbler task, my fameless pen pursues.

Shall roses bloom in verse from age to age,
Shrubs spread their foliage on the poet's page;
The willow, poplar, fir and cedar throng
Alike the rustic and the classic song;
Pines wave in Milton, and no bard be found
To plant the maple on poetic ground?

Columbia's muse forbids, in simple strain
She sings the maple and the hardy swain,
Who draws the nectar from her silvery pores,
Nor envies India all its pamper'd stores.

What though the cane, our colder clime denies;
The cultured plant a native tree supplies;
A tree, the fairest of the forest kind,
Alike for use and ornament design'd.
For use to those, who first essay the wood,
To form the table and supply its food;
To warm the laborer by its bounty fed;
And rear the lowly cottage o'er his head:
For ornament, to grace the winding rill,
Shade the green vale or wave upon the hill;
Or leave the forest, where it useless grows,
Rise in the cultured field in stately rows,
Spread o'er the rocky waste a shady grove,
The haunt for sportive mirth and pensive love.

Ere jarring seasons rest in equal scales;
While winter now, and now the spring prevails;
Sol's milder beams around the maple play,
Frost chills by night, a thrilling warmth by day
Dilates each tube; the tube by mystic laws
The sap nutritious from earth's bosom draws;
As higher still the swelling tube distends,
The circling sap to every branch ascends;
Now each young bud the rich donation shares,
For laurel'd spring his earliest wreath prepares.

Great universal Cause, mysterious Power!
That clothes the forest, and that paints the flower;
Bids the fell poison in the Upas grow,
And sweet nutrition in the maple flow;
Let Berkeley's pupil dream in endless trance;
The wilder'd athlete form his world by chance,
By this, his reason, that, his sense belied,
A world discarded, and a God denied;
In spite of these, the impartial eye must see
Each leaf a volume—its great author, Thee;
Nor less in every twig than Aaron's rod,
Behold the agency of nature's God!

GLEANINGS.

Warning. The wife of Mr. Chester Beard, of Rockdale township, is lying dangerously ill. Near a year since she was picking her ear with a pin (a very common practice among females,) the head of which coming off lodged in her ear, and all attempts to extract it proved unavailing, and it is supposed that this will soon be the cause of her death.—*Meadville Messenger.*

"What did Mr. ———, die of?" asked a simple neighbor. "Of a complication of disorders," replied his friend. "How do you describe that complication, my good sir?" "He died," rejoined the other, "of two physicians, an apothecary and a surgeon."

A writer in the *Friendship's Offering* commences a chapter with 'I love an old maid.' Who can say as much?—Much as he may admire an old maid, he omits to tell us how much better he likes a young one!

A boat ascending the Ohio river, was hailed by one coming up—and the following conversation ensued—What boat is that? The *Cherry stone*. Whence came you? From *Red stone*. Where are you bound to? *Lime-stone*. Who is your captain? *Thomas Stone*. What are you loaded with? *Mill-stones* and *Grind-stones*. You are a *hard set* to be sure, take care you don't go to the bottom—*Farewell*.

A person who cannot relish absurdity and wit, and must, moreover, have a satisfactory reason for whatever is said or done, is a philosophical blockhead.

By putting a piece of lump-sugar, the size of a walnut, into the tea-pot, you will make the tea infuse in one-half the time. This fact is very well known to bag-men and stage-coach travellers.

If a woman writes in a bold, manly hand, depend upon it she has got a masculine mind, and in all probability wears the breeches. There is a much greater analogy between the hand-writing and the character of individuals than people are aware of.

Members of dilettanti societies are generally especial asses; their eternal talk about the fine arts, drawing, coloring, harmony, composition, chiaroscuro, fore-shortening, design, &c. is enough to turn the stomach of a horse. The thing is more insufferable, because they absolutely know nothing of the subject, and have about as much real appreciation of genius as a pig possesses for the inventions of Watt or Dædalus.

There is, perhaps, not an instance of a man of genius having had a dull woman for his mother, though many have had fathers stupid enough in all conscience. Talent, therefore, is much more communicable to the offspring from the maternal side than from the other. If a man wishes to have clever children, this may perhaps serve him as an apology for marrying a woman of talent, should all other excuses be wanting.

'Go'—*A transitive verb.* A teacher not long since in explaining the difference between transitive and intransitive verbs, told the classes that the verb 'go' was intransitive, because it would not make sense with the words *a person* or *a thing* after it. When a little fellow looking very significantly at him said 'Sir, don't people go the whole hog sometimes?'

Anagrams. The letters in the word "warranted," will spell 167 good English words, besides many other in different languages.

In boiling salmon, split the fish from head to tail; if you do not do this, but boil it entire, or cut horizontally through the middle, it is impossible to cook it thoroughly, the thickness of the back and shoulders being such, that if the outside be properly done, the inside must needs be little better than parboiled. On the Tweed, and other salmon districts, the latter system is held in abomination.

If you wish to annoy a little man, quiz him about his diminutive stature. He will affect to laugh at himself; but will, for all that, hate you like the devil.

Snuff-taking in a woman is abominable, unless she be very aged—say eighty, or upwards,—when it is rather becoming than otherwise.

Never praise or talk of your children to other people; for depend upon it, no person except yourself cares a single farthing about them.

If a person has a great knack at finding out tricks of legerdemain, you may pronounce him a blockhead. I never knew a clever man who was worth a farthing at detecting such tricks.

Arguers and spouters are invariably asses, &c.

WHOLESALE AND RETAIL CASH STORE.

ELIAB STONE BREWER, No. 414, Washington Street, (South end) has received a general assortment of *Spring and Summer Goods*, among which are 100 cases English, French and American Prints of all prices and qualities—20 cases Petticoat Robes—1 case Cambric Muslins, some of which are very fine—1 case Cotton Cambrics do. do.—1 case White Lilies for lining ladies dresses—1 case Book Binders' Cambric for do. do.—3 cases do.—100 cases bleached and brown Sheetting and Shirting, some extra fine—1 case Marseilles Quilts, from 8 to 10 quarters—5 cases London Rose Blankets, some of a very superior quality and large size—1 case Hearth Rugs—4 cases Chapp's spool 6 cord cotton, warranted—200 yards superior quality—5 cases Clark's do. at very low prices by doz. or case—2000 fancy boxes—a large variety of colored and black French Silks at very reduced prices—2 cases cold Battiste—1 case black and colored Barage—4 cases French and London printed Muslins of new patterns and beautiful colors—2 cases three corded superfine Italianettes, black and fashionable colors—1 case common do—1 case Plaid Palmgrin's super quality—1 case Pon de Soi a genteel article for ladies' summer dresses, 9d per yd—20 ps super mix'd, drab, and olive Merino Cassinets for children's summer dresses—20 ps Rouen Cassimere with a large variety of superfine and fine Broadcloths and Cassimeres—20 bales Pelisse Wadding—3 cases superior Ticking—4 cases cheap do—10 cases improved soft finished 4-4 Irish Linen, manufactured for the London market and imported expressly for the subscriber.

Extracts from "Transactions of the Essex Agricultural Society for 1832."

IRRIGATION.

ONLY one claim was entered for experiments in Irrigation,—by Mr. Ebenezer Jenkins of Andover South Parish. Your Committee visited his farm on the 25th of July last, and witnessed the result of his experiment. Mr. Jenkins, by erecting a cheap dam in an adjoining pasture, and by digging a small trench for about thirty rods, has taken the water from a brook and so conducted it as to irrigate about half an acre of dry gravelly upland and about half an acre of meadow land adjoining. In consequence of this, he believes that he has obtained nearly double the quantity of Hay which the land formerly produced. Your Committee estimated the Hay taken from the acre of upland, to be about 2700 lbs. The grass standing on the meadow, was very good. He states the expense of the experiment, including \$10 paid for use of the water for ten years, to be \$30. By altering his trench, he can convey the water over another acre of land, and intends doing so the next season. Your Committee did not consider the experiment sufficiently extensive or complete to be entitled to the Society's premium; but regarding it as a specimen of well directed industry, highly creditable to Mr. Jenkins, and being desirous to excite others to similar attempts, they recommend that a gratuity of five dollars be presented to Mr. Jenkins.

By order of the Committee.

JAMES H. DUNCAN, *Chairman*.

Sept. 27, 1832.

MILCH COWS AND HEIFERS.

THE Committee of the Essex Agricultural Society on Milch Cows and Heifers offer the following Report—

This subject is interesting not only to those who make farming their business, but to every family whose situation and circumstances make the keeping of this valuable animal practicable; it is important not only because cows supply the market with milk and butter and cheese, but because they contribute so much to substantial domestic comfort and convenience.

Sportsmen and naturalists, and perhaps some others of the *unproductive class*, have supposed their favorite horse to be the most valuable of domesticated animals, but the calculating utilitarian, and the discriminating farmer, have with united voice pronounced the Cow, "the noblest conquest made by man."

There is a great difference in the quantity and quality of milk given by cows of the same appearance, and treated in the same manner. Not unfrequently in the same yard, the product of one cow is worth double that of another. A good cow will more than repay her cost in the milk she will yield in six months. Suppose her to give six quarts per day, this, for six months, at three cents per quart, amounts to more than thirty dollars. It is presumed that every man who keeps a cow is desirous of having one of superior qualities, but it is more the result of good fortune than prudence, if he obtains such an one, in the ordinary way. He goes to the market, or the drover, and purchases an animal which those who have had an opportunity

to try, are willing to dispose of. The raiser of stock knows his best animals, and will prefer to reserve them at home. We think the farmers of our county should make the experiment of rearing their own cows; the cost may be a little enhanced, but the chances of having better stock are greatly increased. Let them raise the young of their cows which they *know* to be good milkers, and to have other good properties, and in a few years, instead of four or five quarts as now, the average yield would be eight or ten. We have heard of great success in improving stock in England, we have witnessed something of it here, and are satisfied that with proper attention, our cows will become much more valuable. In raising stock at home, there are these additional advantages, that the animal is already acclimated, there is no danger of her straying and she is accustomed to the food and treatment. A change of situation and fodder is sometimes fatal, and frequently causes, at least, a temporary derangement of the system. This may be one reason why imported stock, excellent as some varieties of it unquestionably are, have not answered the expectations of those who had made an unsuccessful, because perhaps, a not sufficiently protracted and careful trial.

A principal cause of the general character of our cows being so low, is the quality of their winter keeping. Their natural food, in their wild state is green and succulent. Their winter keeping with us is almost exclusively, dry hay. The quantity of moisture lost in curing different kinds of grasses has been ascertained by accurate experiments, and it is found that

| | |
|--------------------------------|------------------|
| 100 lbs. Green red clover make | 27 lbs. of hay, |
| 100 " " herds grass | 40 " " |
| 100 " " fresh meadow | 38 " " |
| 100 " " salt grass | 39 " " |
| 100 " " Eng. 2d crop | 19 " " |
| 100 " " Corn stalks | 25 " dry stalks. |

600 188
so that more than two thirds the moisture, which must be a large constituent in the secretion of milk, is lost in the process of drying. Do not such experiments, as well as common observation, demonstrate that our farmers do not provide a sufficiency of green food? We think it would be profitable to raise root crops, such as mangold wurtzel carrots, Swedish turnips, and even round turnips to feed out to cows at the season, when other succulent food is inaccessible. If a cow is suffered to become poor in the winter, it will be difficult to restore her flesh, and her product of milk, for that year, will be greatly diminished. Keep no more stock than can be well fed both through winter and summer. It is more satisfactory and pleasant to obtain ten gallons of milk from five well conditioned, than from ten "ill favored and lean fleshed kine."

Neither very young, nor very old cows, are considered so valuable for their annual product, as those of intermediate ages. Unless of extraordinary properties, they should not be kept after they are ten or twelve years old. Such cows require better keeping, and are more liable to accidents and diseases. No kind of stock better compensates for liberal feeding. If a supply of roots has not been procured, a small quantity of meal or a

few ears of Indian corn daily, will cause a perceptible improvement. A cow that is worth keeping is worthy of liberal feeding. On short commons and poor fodder, her milk qualities, and her progeny will degenerate. Give her an abundance of nutritious food, and in return, she will give you

"New milk that, all the winter, never fails,
And all the summer overflows the pails."

* II. Eclogue of Virgil, 22d line.

We think it unnecessary to extend our remarks, since this subject was so fully and satisfactorily discussed by the Rev. Henry Colman in his report, published in the last year's transactions of this Society, and which is in the hands of every farmer who feels an interest in such investigations. And we are doing but common justice to that distinguished scientific and practical cultivator, who has since removed to a distant part of the state, when we express a sentiment of lasting gratitude and profound obligation for his valuable services as a member of this Society, as well as for his very interesting publications on subjects connected with rural economy.

The Committee on Milch Cows and Heifers, report—that eleven Milch Cows were offered for exhibition and premium, viz.

For exhibition, a very handsome cow, in fine order, by Ebenezer Moseley of Newburyport.

Moses Bartlett of Newbury, offered a handsome five years old cow, which, on common pasture feed, has made 10 lbs. butter in one week.

Nathaniel Ladd of Bradford, offered a cow six years old, which, from June 1st to Sept. 26th, made 90 1-4 lbs. butter, besides supplying three families with milk; fed on grass only. Undoubtedly a good cow, but the statement was not sufficiently explicit.

A small sized cow belonging to Rev. Mr. Miltimore of Newbury, which, from May 27th to Sept. 25th, made 87 3-4 lbs. butter, besides supplying a family of eight persons with milk and cream.

A cow belonging to E. W. Allen, of Newburyport, which, from June 1st to Aug. 15th in the year 1830, made a little over five pounds of butter per week, besides supplying two families with from three to four pints of milk per day—and she has yielded as much this year as in 1830.

Stephen Tilton of Newburyport, offered a cow four years old, which is a good milker.

The Committee have awarded to Parker M. Dole of Newburyport, for his two native cows, which, from about the 1st of May to Sept. 27th, have made 157 lbs. butter, besides about 40 gals. milk, used and sold, kept in a poor pasture, a gratuity of \$2.00.

To Edward Titcomb, jun. of Newburyport, for his four years old cow, half Holderness, which on scanty keeping, has yielded from July 10th to Sept. 26th an average of 10 quarts per day, a gratuity of \$2.00.

To Timothy Noyes, of Newburyport, for his six years old cow, which in the last thirteen months has yielded 1116 gallons of milk, more than 11 1/4 quarts per day, (her butter qualities not mentioned,) a premium of \$5.00.

To John O. W. Brown of Newbury, for his sev-

* "Lac mihi non estate novum, non frigore deficit."

en years old cow, which, from June 6 to July 11th, gave more than 15 quarts of milk per day on ordinary pasturing, and which, besides supplying 3 quarts per day for families' use has afforded from June 1st to Sept. 26th, 107 lbs. 7 oz. of butter, a premium of \$10.00.

To Timothy Flanders of Haverhill, for his cow, nine years old, raised in Deerfield, N. H. \$15.00.

On common pasture feed, (till the time when stalks became fit to cut,) besides 46½ gallons of milk for family use, she has yielded milk from the 20th April to Sept. 22d, from which 163 lbs. 4 oz. of butter were made. She has never given more than 16 quarts per day. Mr. Flanders' statement was well authenticated and satisfactory.

The Committee award to Nathaniel Jackson, of Newburyport, for his two years old heifer, which, from June 1st to Sept. 27th, has given more than two gallons of milk of good quality per day, the 2d premium of \$5.00.

To John Torrey of Newbury, for his three years old heifer, which has yielded more than two gallons of milk per day, of superior quality, a gratuity of \$2.00.

To Ralph H. Chandler of Andover, for two heifers, one two and the other three years old, which have yielded a good quantity of milk and butter, a gratuity of \$2.00.

Capt. Hector Coffin offered, for exhibition only, two handsome heifers of native stock; in his statement, Capt. C. remarks, "I make it a point to bring all my heifers in with their first calves after pasturing time has commenced that so green fodder may aid in swelling out their young udders; which process followed for the two or three first years, invariably makes a good milker."

Col. Moses Newell of West Newbury, offered for exhibition, four very handsome two years old heifers, one eighth Admiral, not in milk; they were of promising appearance. Col. N. raises his own dairy stock, and it is safe to follow the example of a farmer of so much skill and discrimination.

For the Committee, DANIEL P. KING.
Sept. 27, 1832.

From the Maine Farmer.

ENGLISH TURNIPS.

A PRACTICE obtains with many of our farmers of fencing off a small piece of land, and yarding their cattle upon it a few weeks, and then sowing it to English Turnips; but I have rarely known an abundant crop as the result of this practice. As the season has now arrived for sowing this Turnip, I would suggest a few remarks relative to raising it in a cheaper and more productive manner than the one above mentioned. Select a field of corn which has been highly manured, and previous to your last hoeing sow your seed, and hoe as usual. Any further care is unnecessary till time of harvest. I have obtained a better crop in this way than any other. Twenty, thirty, and even fifty bushels may be raised from an acre, according to the season and the richness of the soil.

Much depends on the season, a warm and wet one being necessary to the rapid growth of this vegetable. The corn in this case (as in fact it ought to be in every other,) should be hoed three times, and care should be taken not to seed too heavily.

The difference of the two methods here presented, may be stated in a few words, and will be found to exhibit results highly favorable to the latter. The former method is attended with con-

siderable labor and expense; the latter comparatively none. In the one case the liability to which the Turnips are subject in being overrun with weeds, grass, &c. is ten to one that of the other. Should any local or accidental circumstance destroy your crop, your loss of labor, &c. by the former process is considerable; by the latter none except the seed. A trial will prove the correctness of these remarks.

This vegetable for culinary purposes is greatly esteemed, and a highly nutritious food for cattle and sheep.

CAROLUS.

AROMA OF FLOWERS, PLANTS, &c.

THE fragrance of a garden, particularly in August, is delightful, from the combination of both fruits and flowers. It is said that the fragrance of flowers depends on the volatile oils they contain; and these oils, by their constant evaporation, surround the flower with a kind of odorous atmosphere, which, at the same time that it entices larger insects, may, probably, preserve the parts of fructification from the ravages of the smaller ones. Volatile oils, or odorous substances, seem particularly destructive to minute insects and animalcules which feed on the substances of vegetables. Thousands of aphides may be usually seen on the stalks and leaves of the rose, but none of them are ever observed on the flower. Camphor is used to preserve the collections of naturalists. The woods which contain aromatic oils are remarked for their indestructibility, and for their exemption from the attacks of insects. This is particularly the case with the cedar, rosewood and cypress. The gates of Constantinople, which were made of this last wood, stood entire from the time of Constantine, their founder, to that of Pope Eugene IV, a period of 1100 years.—*Time's Telescope*.

BUTTER.

BUTTER is one of the staple productions of our State; and every hint that serves to improve its quality, or increase the quantity, must be useful. There are various methods of making butter, as from new milk, lobbared milk and cream; and there is certainly a great diversity in its quality. The cause of this difference may partially be owing to the season, the feed and the breed of cows, but most is owing to bad management. Our dairy women are very much like their good husbands, apt to be somewhat conceited, too wise to learn, and generally believe their own mode the best, and never suspecting that philosophy or science can have any sort of connexion with this humble branch of household labor. All seem to be agreed, however, upon the following points:

1. That cleanliness is the first requisite, for many and very obvious reasons.
2. That every sort of liquid should be separated from the butter—because if such is suffered to remain it soon becomes rancid, and taints the mass.
3. That the salt used to preserve it should be pure, because bad salt will not keep it sweet; rock salt, and that produced by solar evaporation being deemed best.
4. That no more salt be used, than is necessary to render the butter palatable—all excess being injurious to the taste, and an imposition upon the buyer.
5. That the vessel in which it is packed should be incapable of imparting to it bad flavor—wood abounding in pyrolignic acid, and red earthen being improper—the first giving a bad taste, and the

latter, by reason of the decomposition of the glazing which contains lead, being in a measure poisonous.

That when packed, the external air should be wholly excluded from the butter—because the air soon induces rancidity.

My dairy woman has added two other rules, which she deems all important to the preservation of good butter, but which I am induced to think are but little known and less practised, viz:

7. That no water be suffered to come in contact with the butter in any stage of the process—because it tends to lessen the essential volatile matter which gives to the butter its rich peculiar flavor.

8. To have the salt incorporated with the butter in the first operation of working, and after an interval of twenty-four hours to apply again the butter ladle until the whole of the liquid is expelled. By this operation the salt is dissolved and effectually blended with the butter, which is freed more effectually from buttermilk.—*Gen. Far.*

From the Southern Planter.

RHUBARB.

MANY of your readers may not be acquainted with the fact, that Rhubarb (raised in most of our gardens) is nearly as useful in making tarts as apples or peaches. It is easily cultivated, and the produce of one root will make several tarts. The seed from one stalk will sow all the spare ground which may be found in a common garden. If extensively cultivated, it would supply a great deficiency in the pastry department, as it is the earliest plant that appears in the spring. It is prepared for use thus: the stem or stalk of the leaf being stripped of the thin useless parts, is to be cut into small pieces an eighth of an inch in length, taking care in the operation to peel off the thick rind which encircles the lower part of the stalk. Thus prepared, it must be boiled in the same manner as dried apples, and with seasoning similar to what is used for those, is made into pies. A bed of rich earth forty feet square, will produce plants enough for 100 tarts.

RUSTICUS.

CARPENTERS BEWARE OF FRAUDS IN PURCHASING YOUR TOOLS.

MR. N. P. AMES, of Springfield, Mass. the maker of the most approved cast steel carpenters' compasses, called upon the editors of this paper, and exhibited a pair of *English Compasses*, marked "N. P. Ames" Springfield, cast steel, being made of nothing but iron. These compasses are imported and sold in this city, as genuine, at a reduced price, but a slight examination will discover the difference. The spurious article is not so large as the true one, nor by any means as neatly made; the taper of the prongs is not as regular, and the joint in the Springfield made compasses gives them an equal degree of tension in opening them, throughout the whole span; being made by a cutting machine—whereas, the joint in the counterfeit *English* articles is filed, and has a greater or lesser tension, as the prongs are more or less expanded or opened.

It is in this way that England has the character of making articles so cheap as it is called! when on strict examination, in all edged or pointed tools, more particularly those used by carpenters and joiners, the American made implement is generally one hundred per cent. more useful and durable than a similar one made elsewhere.—*N. Y. Gaz.*

MASS. HORTICULTURAL SOCIETY.

EXHIBITION AT THE MASS. HORT. SOC. ROOMS.

Saturday, July 20, 1833.

APPLES. Early Harvest, by Mr. Winship from the garden of Gorham Parsons, Esq.

PEARS. Petit Muscat, by Mr. Samuel Downer, from Scions received by him from Messrs. Blood-good, as the Bleekers Meadow.

By Jacob Tidd, Esq. of Roxbury—Handsome small early Pears.

GOOSEBERRIES. By Dr. S. A. Shurtleff, Roaring Lion; White Smith; Green Gage and Golden Ball.

By Mr. Samuel Walker, Roxbury, several varieties.

By Mr. Abel Houghton, Jr. Lynn, Long Yellow, White Rock; Green Walnut; Red Warrington; Smiling Beauty.

By Mr. A. D. Williams, Roxbury, several varieties.

CURRENTS. By Mr. A. D. Williams, Large White and Large Red Dutch. By Mr. Samuel Walker, Large Red Dutch.

A fine specimen of Gridley CHERRIES was exhibited, for premium on Saturday last, by Mr. Richard Ward of Roxbury; and Large Green Ocean GOOSEBERRIES by Mr. Samuel Pond, Cambridge, which were omitted.

For the committee on Fruits, &c.

E. Vose, Chairman.

Specimens of the following varieties of Peas, were exhibited by Mr. Haggerston, from the garden of the Society grown from seed received from the Horticultural and Botanical garden of Naples. Piselli di Roma grandi, a good bearer. Piselli Rossi sanga filo grandi. Piselli Rossi sanga filo. Piselli sanga filo. Piselli di Roma; Piselli Rossi; Piselli di Boemia, the three last varieties prove to be shy bearers.

Poinsett Peas—pods very full and good bearers, grown from seed received from Mr. S. Walker—introduced into this country by the Hon. Mr. Poinsett.

FROM S. WALKER, Roxbury, Dahlia Imperiosa; Carnations Picotees; Scabiosa auto purpurea; Tradescantia virginica; do. do. alba; do. do. rubra; Statice tartarica; Monarda didyma; do. purpurea; Lythrum salicaria; Veronica virginica;—Spirea ulmaria, &c.

THO. MASON, Charlestown Vineyard, Dahlias and other kinds of flowers.

ABEL HOUGHTON, Jr. Lynn, variety of Carnations and Pinks.

Messrs. WINSHIP, several kinds of flowers.

Per order, JON. WINSHIP, Chairman.

GLASS HONES.

A HONE, called the 'Patent Sillex, or Glass Hone,' has been recently made, possessing the combined virtues of the most improved hones and straps, for the use of razors and penknives, and perfectly free from grit, and does not require the use of oil or water. It produces the keenest edge without wearing away, and leaves a polish to the blade. It has four sides, from a coarse ground to a smooth and freely polished surface, and does not destroy the temper of the blade. The price, it is said, will be reasonable, and one hone will last a life time.—*N. Y. Adv.*

From the New York Farmer.

MISCONSTRUCTION OF WHEEL CARRIAGES POINTED OUT.

It is the practice to make the hind wheels of wagons, and most other four wheeled carriages, the highest; but the advantage of so doing is not clear to me, and from the following experiments, it seems to be erroneous. Most people, too, concerned in the loading of wagons, have an idea that they are drawn more easily if loaded heaviest before, that is, on the fore-wheels. Having long since embraced a different opinion, I resolved to put it to the test of experiment. I made a small model of a wagon, in size a twenty-fourth part of the size of those used by farmers in general, and weighing 10 oz. This I placed on an horizontal board, three feet long, which had a small (pulley) wheel at one end, over which ran a thin cord, one end of which was fastened to the fore-part of the wagon, while from the other end there was suspended a small scale to contain weights, which of its own weight would just move the wagon along the board when unloaded.

The first trial was with four wheels of 2 inches, and hind ones of 3 inches diameter. The forepart along the board took 5 oz. in the scale. When off the carriage was then loaded with 33 oz. and the hind wheels with 16 oz. To move this the loading was reversed, that is, 16 before and 32 behind, it was drawn by 4 oz. It was next loaded with 32 oz. on each pair of wheels, and was then drawn by 6 ounces.

The fore-wheels were next placed in two hollows sunk in the board three-eighths of an inch deep, loaded as in the first trial. The carriage was drawn out by 29 oz.; when the loading was reversed, as in the second case, it was drawn by 21 oz.; when loaded equally, as in the third case, it was drawn by 33 oz.

The hind wheels were then taken off, and their places supplied by a pair of equal diameters with the fore-ones, namely, 2 inches.

Loaded as in the first, second, and third instances, it took to move it along the level nearly the same weights; but when the fore-wheels were placed in the hollows, it took less by 4 oz. each trial; when the loading was reversed, and made equal, the results were as before.

The pulley-end of the board was then elevated to an angle of 33½ degrees with the horizon, which is nearly equal to that of a hill rising 4 inches in the yard; if loaded as in the first instances, the carriage required to draw it up 13 oz.; loading reversed (as before) 15 oz.; equal, 14 oz.; wheels in the hollows, nearly as before.

To the above may be added the very great uneasiness occasioned to the shaft-horse, when either of the fore-wheels meets with any obstruction from stones, &c. and which is evidently increased in proportion to the smallness of the circumference.

E. VIALLS.

MANUAL LABOR SCHOOLS.

We cannot refrain from a few remarks on this excellent system of education, the progress of which has become so rapid, and which we see from a notice in the last Emigrant is now gaining a place in this Territory. It comprises advantages not to be found in any plan of instruction ever before adopted. The objects of education have become better understood of late, and a new era is about to commence in its modes of operation. The fact is but lately well known and acted upon that the

body and mind must share equally in our attention if we would insure the improvement of either. We now begin to hear less of the martyrdom of students, whose efforts have been prematurely arrested by disease, leaving their friends to weep over their untimely fate, and the loss of all they had hoped to gain from sacrifices of comfort and convenience, to facilitate the progress of their sickly favorites. The student is now like other men—breathes the same air, tastes the same food, and enjoys the same undisturbed slumbers, as the rest of the busy moving throng around him. This is as it should be. The scholar may now be greeted as a fellow by every man of worth and industry, and his efforts may be seen combined with those of the mechanic, the agriculturist and the merchant, in the accomplishment of real substantial ends. He is no longer a visionary, mistaking the delusive phantoms of his disordered brain for the spirits of a clear and perfect perception, but he is in a word a practical man, and one of the world. This system too has another recommendation. It will do away aversion to bodily labor. Many students become so merely from indolence. They think it very pretty to wear a genteel dress, and be excused from the heats of summer or the frosts of winter, while the labors of others procure them all the necessities and luxuries of life. To such anti-republican motives a stop is now to be put. He who adopts the student's life hereafter will not be deceived by appearances. He will find that he is not entering a distinct and privileged order. He will see no difference between this and the most laborious class. Heat and cold, hunger and thirst, fatigue and rest, are equally shared by both. But more than all this, we shall in time know of no such distinction as the laboring, and the upper classes. All will be laborers; all will be students. Every one may rear his children under the same privileges. The poor man may find the education of his offspring not a burden, but a relief to him, for while they are improving the mind, the labors of the body will more than support it. Such a state of things as a whole community well or highly educated is not impossible or improbable. Occurrences stranger than this are common. In this country nothing is too high or noble in the character of the people, which we may not hope for.—And this once secured, we may be content. All things else are ours when this is attained. Disunion, anarchy, despotism, need no longer be dreaded. We are above their reach.—*Detroit Courier.*

INDIAN RUBBER TABLE CLOTHS.

We have recently seen, and have in our possession a sample of a new and superior kind of cover, for tables and stands. They are manufactured by Samuel Steele & Co. Woodbury, Ct. They are composed of cotton, with a composition of Indian rubber, &c. varnished and bronzed in an elegant manner. They cost but little more than common oil cloths, and are much superior both for beauty and durability. One very important quality which they possess over any oil cloth covers, is their elasticity, as they can be doubled in every possible manner without breaking or injuring the composition of which they are made.—*Danbury Herald.*

Temperance Poet. The immortal Bard of *Paradise Lost* entertained a decided aversion to all sorts of strong liquors.

From the Turf Register.

OSAGE HORSES.

Cantonment Jesup, Lou. July 15, 1832.

THE modern turf horse is said to be deficient in the powers of endurance and ability to carry weight, which were so eminently possessed by the immediate descendants of the Arabian, Barb and Turkish horses, which produced the unrivalled English stock. My object is to direct the attention of American breeders to a stock of horses possessing good wind, great powers of endurance, and hardy constitutions, with fine, bony, sinewy limbs. They are indigenous to our continent; and if the experiment I recommend, of crossing them with our bred horses, succeed, will preclude the necessity of recurring to the present race of horses in England, which is doubtless degenerate. I allude to the wild or prairie horse, inhabiting the southwest region of our continent, and roaming amid the immense grassy plains of that section, and to this race, partially tamed by the savage tribes of the country. No one who has seen the Osages galloping over their boundless prairies, under their fervid sun, and maintaining this gait for hours—viewed their muscular and handsome steeds, and compared his own jaded nag with the bounding and restless animals around him—but has confessed the superiority of their horses over ours. In July, 1829, the writer accompanied a party of gentlemen on a visit to Clermore's band of Osages, on the Verdigris river, a tributary of the Arkansas. A runner having been despatched to apprise them of our intention, upon arriving within two miles of the town we halted to await their welcome. In a moment they were in commotion, and the chiefs and principal warriors (in number about a hundred) mounted, and approaching at full speed; bearing lances, and shields, painted of various colors, and otherwise adorned; their heads surmounted with helmets of feathers and red and blue cloth; their arms and legs clasped by tinkling bands; some naked, with the exception of the breech-clout; others clothed in the favorite dress of the Indian, a blue frock, with red collar and cuffs; and another portion with only the painted blanket streaming from their shoulders; sounding their war cry, and advancing rapidly and tumultuously; rushing in among us to give a welcome, and then wheeling their horses on the vast surrounding plain, in mimic pursuit of each other. They presented a most joyous, novel and splendid barbaric spectacle. Here it was that my admiration of their horses was first excited; for this was the first opportunity I had of viewing their good horses. Among them were three or four, evidently of the same family; on one of which Clermore himself rode. They were of a beautiful cream color, with black manes and tails; a dark stripe along the back, and dark or black legs from the knees down; not over fifteen hands in height, but of compact, stout frames. A mahogany bay, of this size and form, caught my eye, as possessing a most superior walk. One brave sported a Pawnee head dress, horse, and other spoils, taken in battle. The stallion was of a very dark and peculiar iron grey, tall and slender, but a most beautiful animal. There is now at Cantonment Gibson a wild mare, caught by the Osages when on a hunt. She is white, with a neck like a stallion; finely formed in every respect; of great length of body, and having remarkably fine limbs. Every attempt has been made to break her, but with indifferent success; she having thrown, at

their imminent hazard, all her riders. She has produced a likely, but small, brown bay filly, by one of the worthless Cherokee ponies about the garrison. When we consider the firm, elastic soil, excellent herbage, and fervid sun of the plains over which these horses roam—the question, what advantages in soil, climate or food, the desert or mountain Arabian horse possesses over them, naturally presents itself. They ought to possess, in an equal degree, the flinty hardness of limbs, speed, &c. of the Arabian. But one reason can be given for the superiority of the latter, (if they be in fact superior,) viz.: that the Arabs have been more careful in perpetuating a good strain and in suffering no inferior cross. But from the fact of the Osages prizing very highly their good horses, and the reluctance with which they part from them, together with my observing a particular family of horses among the chiefs, induce the conclusion that a peculiar breed exists among them; and I submit to sportsmen, whether an experiment, with a few of their stallions and mares, is unworthy a trial. Assuredly there are in our country gentlemen of fortune, enterprise and patriotism enough, to make the experiment; and though the immediate cross with the blood horse should not evince speed enough to make first rate turf horses, yet their stamina would, by judicious crossing, produce those fine saddle and draft horses which a late writer (Mason) asserts the Virginia turf horse of the present day rarely produces. Should the experiment be made, (and there are so many mares and stallions of every degree of excellence and blood, in Virginia and Kentucky especially, that it might be conducted without bearing too onerously upon an individual sportsman,) it should not be abandoned in despair, though the first or second cross should not equal expectation. When we recollect the perseverance, repeated trials, and number of years, devoted by a Duke of Cumberland, before he succeeded in obtaining a superior stock of horses; and the pertinacity of an Earl of Oxford, in establishing the truth of a theory, by continuing a cross (of greyhounds) to the eighth remove, ere he attained the degree of perfection anticipated, we should be incited to attempt and continue our experiments. In order, Mr. Editor, that breeders may know what facilities they would meet with, and be enabled to form some idea of the expense they might have to incur, I will state the most expeditious mode, and best season, for reaching the country of the Osages.—From January to June the Arkansas has water enough for the steamboats which ply from the mouth of White river and New Orleans, to ascend to Cantonment Gibson. This post is, by water, about six hundred and fifty miles from the Mississippi; by land, about three hundred and fifty. Clermore's village is distant from it fifty-five miles. Forty miles from the garrison is the residence of their trader, Col. A. P. Choteau, of St. Louis; a gentleman whose predilection for the sports of the turf would induce him to exert his great influence to persuade the chiefs to part with their best horses. I cannot, at this moment, refer to the Indian laws; but think they prohibit any purchase from the tribes without the sanction of their agents. The agent of the Osages is Mr. Humtramck, who resides at White Hair's town, situated on the Osage river, a tributary of the Missouri. But, upon application, doubtless the President or Secretary of War would authorize an attempt to purchase.

A SUBSCRIBER.

To preserve Beans and Peas. Peas and beans may be preserved through the winter by scalding them in a strong syrup of sugar and drying them—after which they should be put in a bottle and corked close. If each part of this process is conducted with care, it will be found when they are cooked that they have lost but little of their flavor, and that they will form a great addition to vegetable dishes during the winter.—*Genesec Farmer.*

SWEET APPLE PUDDING.

TAKE one pint of scalded milk, half a pint of Indian meal, a tea cupful of molasses, a tea spoonful of salt, and six sweet apples cut into small pieces—should be baked not less than three hours—the apples will afford an excellent rich jelly. This is truly one of the most luxurious yet simple Yankee puddings made.—*N. Y. Farmer.*

CREAM.

New Method of obtaining Cream from Milk, by G. Carter, Esq. of Nottingham Lodge, near Eltham, Kent. The process of divesting the milk of its component portion of cream, to an extent hitherto unattainable, has been effected by Mr. Carter, and is thus detailed by that gentleman in a paper presented to the Society of arts. A peculiar process of extracting cream from milk, by which a superior richness is produced in the cream, has long been known and practised in Devonshire; this produce of the dairies of that county being well known to every one by the name of "clotted" or "clouted cream." As there is no peculiarity in the milk from which this fluid is extracted, it has been frequently a matter of surprise that the process has not been adopted in other parts of the kingdom. A four-sided vessel is formed of zinc plates twelve inches long, eight inches wide, and six inches deep, with a false bottom at one half the depth. The only communication with the lower compartment is by the lip, through which it may be filled or emptied. Having first placed at the bottom of the upper compartment a plate of perforated zinc, the area of which is equal to that of the false bottom, a gallon (or any given quantity) of milk is poured (immediately when drawn from the cow) into it, and must remain there at rest for twelve hours; an equal quantity of boiling water must then be poured into the lower compartment through the lip: it is then permitted to stand twelve hours more, (i. e. twenty-four hours altogether,) when the cream will be found perfect, and of such consistence that the whole may be lifted off by the finger and thumb. It is, however, more effectually removed by gently raising the plate of perforated zinc from the bottom by the ringed handles, without remixing any part of it with the milk below. With this apparatus I have instituted a series of experiments; and, as a mean of twelve successive ones, I obtained the following results:—Four gallons of milk, treated as above, produced, in 24 hours, 4½ pints of clotted cream, which after churning only 15 minutes, gave 40 ounces of butter. The increase in the cream, therefore, is 12½ per cent. and of butter upwards of eleven per cent. The experimental farmer will instantly perceive the advantages accruing from its adoption, and probably his attention to the subject may produce greater results. I shall feel richly rewarded if, by exciting an interest on the subject, I can produce any, the slightest, improvement in the quality or mode of producing an article which may properly be deemed one of the necessities of life.

From the Lowell Daily Journal.
LOWELL.

THE whole amount of capital at present invested is \$6,150,000. The number of mills in actual operation is 19. These mills are each about 157 feet in length, and 45 feet in breadth—of brick, 5 stories high, each story averaging from 10 to 13 feet high, thus giving opportunity for a free circulation of air. The aggregate number of spindles used is 84,000—looms 3,000. The whole number of operatives employed is about 5000, of which 1200 are males, 3800 females. The quantity of raw cotton used in these mills per annum, exceeds 7,000,000 lbs. or 20,000 bales. The number of yards of cotton goods, of various qualities, manufactured annually, is about 27,000,000. Were the different pieces united, they would reach to the distance of 15,300 miles! In this estimate is included about 2,000,000 of yards of coarse mixed cotton and woollen negro clothing, in the manufacture of which about 80,000 pounds of wool are used per annum.

The quantity of wool manufactured annually into Cassimeres is about 150,000 yards.

The Lowell Carpet Manufactory is in itself a curiosity—68 looms are kept in operation by hand labor, viz: 50 for ingrained or Kidderminster carpeting, 10 for Brussels, and 8 for rugs of various kinds. 140,000 lbs. of wool are in the course of a year manufactured into rich and beautiful carpets, the colors of which will vie with any imported. The number of yards of carpeting made per annum is upwards of 120,000, besides rugs.

The operatives at present employed in all these mills receive for their labor \$1,200,000 per annum.

The Lawrence Company has now but one mill in operation. One other is erected, and will be in operation in about three months. The foundations of two others are laid, which will be ready to go into operation, one in 9 months, the other in 12. These mills will contain about 16,500 additional spindles for cotton, and 550 looms, and will use 2,500,000 lbs. raw cotton annually, furnishing employment for 700 operatives. These three mills will probably be the means of adding at least 1500 to the population of Lowell.

The Middlesex Company has lately erected another mill for the manufacture of Cassimeres and Broadcloths, which is said to be one of the first manufacturing edifices in the United States. It is 153 feet in length, by 46, and 6 stories high. Nearly 1,000,000 of bricks have been used in its construction. It will go into operation in about two months, and will contain 2880 spindles, and 64 looms for Cassimeres, and 40 for Broadcloths. It will work up about 300,000 pounds of wool annually, and employ about 225 operatives.

The edifice in which all the machinery employed in the mills is manufactured, is termed the "Machine Shop," belonging to the Locks and Canal Company, and is probably the largest "shop" in the country, being built of brick, four stories high, 220 feet in length and 45 in width. About 200 machinists, some of them the most skilful and ingenious workmen in the United States, or in the world, are constantly employed. About 600 tons of cast and wrought iron, two thirds of which are of American production, are annually converted into machinery, besides a large quantity of imported steel.

It is computed that upwards of 5000 tons of anthracite coal are annually consumed in the Low-

ell Manufacturing establishments and Machine Shop, besides immense quantities of charcoal and pine and hard wood fuel.

Wool.—The Bellows Falls paper states that most of the wool grown in that vicinity has been sold to the manufacturers at from 50 to 75 cents. One fine lot was sold at 80 cents.

From the Nantucket Inquirer.
THE SWORDFISH.

THE swordfish, the natural enemy of the whale, is often taken in this vicinity, and its flesh is held in such great estimation, that it always commands a high price in our fish market. To those who delight in devouring the inhabitants of the deep, a slice of this formidable sea-warrior affords a meal of great delicacy. In shape, the swordfish is nearly cylindrical, handsomely tapering from the head downwards, and terminating in a wide scolloped tail, in which, as in Sampson's hair, lies its chief strength. It has a black and shining skin, without scales, similar to that of the spermaceti whale. They are commonly from ten to fifteen feet in length, weighing from 200 to 500 lbs. The sword, as it is called, or bone, projecting horizontally from the head, is the principal instrument which it employs, either as a weapon of attack, or as a means of procuring food. This "sword" is extremely hard, with a rough, grating surface, some four to six feet long, five or six inches wide, two-edged, and through the centre about two inches in thickness.

Instances are quite common of whales being found wounded on the under side—doubtless by this instrument; and whale ships have frequently been attacked in like manner. We have seen a plank taken from the bottom of a whaler, through which the sword of one of these fish had penetrated, leaving nearly a foot inside the vessel, and twice that length outside. Unable to draw it, the weapon of course became forfeit, and the head of the adventurous assailant must have experienced much pain in parting with it—for it was found broken off near its junction with the skull.

One of these gigantic warriors of the deep was captured on Saturday last, on the south shore of our island, in a manner somewhat remarkable. He had probably given chase to some straggling bluefish or scuppaug (pauggy, as the New Yorkers call them) which instinctively fled towards shoal water, where the pursuer got aground; when the surf rolled him further up the strand, subjecting his head and fins to exposure in another element. In this situation he was discovered by two females from Siasconset. It certainly required some nerve to attack a monster of his dimensions, grovelling and floundering just within his native brine; and the elder of the two felt rather disinclined to engage in such sport. But the younger went manfully to the scratch, and her companion followed. They took him by the horn and by the dorsal, but he wouldn't stay taken in that ignoble style.

At length, after tugging and struggling for half an hour—the tumbling billows the only witnesses, to see fair play, and clear the ring—all the parties being alternately half in and half out of water—the amphibious combat terminated in favor of the assailants. Swordfish had unluckily got canted sideways, just as one of his antagonists was advising an abandonment of the battle ground; but the younger of the fair amazons, vowed she'd cut his throat first, and seizing this

auspicious moment, she plunged into his gullet the deadly weapon—her scissors! It was all she could do for the glory of the conquered! So leaving him with an awful gash in the thorax, writhing upon the beach, the victors trudged half a mile to the nearest farm house, where they procured more effective implements, and returning, finished their work, by decapitating the prostrate sea dragon, chopping him into portable sections, and sending about half "the spoils"—upwards of two hundred weight, to market. When the women first told the story of their having taken this prize, they were asked if they felt sure that the fish was not already dead when discovered? One of them replied, "I guess you would'n't ha' thought so, if you'd ha' seen the sand fly."

From the Northampton Courier.
TREATMENT OF A LUNATIC.

SOME theorists and practical men believe the ravings and delirium of a diseased intellect cannot be mitigated by any external circumstances or disciplinary treatment. We are not advocates or believers in the absurdities of such irrational doctrines, and here we relate an incident illustrating it. At the time appointed for the removal of the Lunatics to the State Asylum at Worcester, upon investigation, one was found in the County House of Correction there, who seemed beyond the reach of human aid or control. For a long series of years the light of Heaven had scarcely dawned in upon him. He was confined in a dark cell of the prison, and his situation was spoken of as indescribably loathsome and wretched. His beard was unshaven, his body attenuated to a mere skeleton, and his mental and physical powers evidently in ruins. He was not merely suffering from ordinary aberrations of mind, but he was afflicted with all the dreadful ravings and painful extravagancies of a confirmed madman. To keep him clothed was deemed an impossibility, and he was suffered to remain in his dungeon with only a few tattered rags and some filthy straw about him.

When the Lunatic Hospital was opened, he was taken from his cell, his long, matted beard shaved, his body thoroughly cleansed, and a coarse suit of strong cloth put upon him. His former keeper remarked it would all avail nothing, for he would never wear clothes, but would still remain the same furious lunatic and raving madman he ever was. When he arrived at the Asylum, he was placed under the care and management of the judicious Dr. Woodward, Superintendent of the Institution. He was then shown his room and told how pleasant and airy it was, compared with the dark, offensive one he had just left. His personal pride was flattered when he was told how well he looked in his new clothes, an object of envy as he was to the other prisoners. He examined himself carefully, looked at his garments and exhibited quite a degree of pride and self-complacency. From this time, he grew fond of his clothes, and when any of the other lunatics approached him, he would shrink back, declaring they wanted to rob him of them. He became pleased with his room and his situation, and the kind treatment and soothing manners of the Superintendent has changed him into one of the most docile, cleanly and promising inmates in the Hospital. He appeared to us passive and kind-hearted, and any thing else rather than the demon they supposed him to be, when confined, naked and filthy, a hideous object in the county prison.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 24, 1833.

FIRE BLIGHT.

In some of the former numbers of the N. E. Farmer, we have published a number of facts, essays and observations on the subject of Blight in the Pear tree and some other fruit trees. In *Goodsell's Genesee Farmer*, of the 4th inst. this subject is discussed, by the Editor, at considerable length, and his remarks appear to be derived from personal and careful observation. After quoting largely from the N. E. Farmer, the observations on this disease by Evan Thomas of Baltimore, E. B. Kenrick of Newton, his Excellency Gov. Lincoln, W. Jackson, Mr. Lowell, Dr. Fiske, Mr. Cranston and others, Mr. Goodsell gives his own opinion as follows:

"One reason why horticulturists have not made more satisfactory discoveries as to the cause of this disease is that they have not commenced their examinations sufficiently early, and have been led to watch the progress of it after the first cause has ceased to operate.

"I am inclined to think that careful examinations will support the following conclusions.

"First—That the blight in Pear, Apple and Quince trees, is occasioned by an insect.

"Secondly—That it is communicated to the pistil of the flower at the time that organ is in its greatest perfection or during the expansion of the flower.

"Thirdly—That it gradually spreads from the point of infection to other parts of the tree, in a manner similar to mortification in the animal kingdom.

"Fourthly—That it is as capable of being communicated by inoculation as the Small Pox.

"Fifthly—That no tree has it, unless by inoculation, until it has produced flowers.

"In support of the first conclusion, so far as we have observed this disease, it has spread from the place where it first commenced in an orchard in every direction, without reference to the general course of the wind at the time; and as the Quince does not come into flower until after the Pear has shed its flower, it cannot be attributed to an intermixture of pollen from the pear tree.

"That it commences at the point of the pistil has been evident from every case we have examined, before the different parts of the flower are decayed. It often appears that not more than one flower in the cluster is infected, the fruit of the infected flower does not swell as the others, which continue their growth, until the mortification has by degrees descended through the stem, to the woody part of the fruit spur, over which it spreads, and ascends the stems of the remaining part of the cluster, which may readily be observed, by a discoloration of them as it advances. In this section of country the disease will be found to have advanced thus far by the first of June, when the leaves on the fruit spur, so affected, will be found withering. After this, the rapidity with which it spreads, depends on circumstances. Where there is the greatest quantity of albumen, or elaborated sap, the disease spreads with greatest rapidity, which is increased by the state of the atmosphere; as in warm moist weather it progresses further than when dry and cool.

"It is not till the middle of June, that this disease begins to manifest itself to superficial observers. About this time the mortification, from the fruit spurs, will have reached the limbs; and where they are numerous, and most of them affected, they will in a short time destroy the branch, so as to cut off all communication between the bark and wood. As the ascending sap passes through the sap-wood to the leaves, before it is elaborated, this communication is not cut off until later in the

season, and the outer ends of the limbs remain green, until the disease has penetrated the wood; at which time the ascent of the sap is cut off, and the whole limb becomes discolored in a short time, often in the space of a few hours.

"We do not pretend to be such an adept in the science of Vegetable Pathology as to be able to describe the manner in which the *virus* of this disease acts upon the healthy parts of the tree, but of this we are satisfied, by repeated experiments, that it is as capable of being communicated by infection as the Small Pox or any disease to which the human family are subject. The manner in which we have conducted these experiments is as follows: We have taken the discolored vivid matter from between the bark and wood of a diseased limb, and put it beneath the bark of a healthy tree, in some instances covering the wound with a strip of rag, which had been dipped in melted grafting wax, in others leaving the incision open; in some instances the quantity of *virus* introduced into the healthy tree was not greater than would be used to inoculate a person for the small pox; and yet in every instance, within from three to five days, the disease has shown itself spreading the same as in a tree which had it the "natural way."

"Trees do not have it the natural way until they have put forth blossoms. We have repeatedly seen young trees growing near those which were in a diseased state, which remained in perfect vigor, and this present season we have examined one which was of a large size which had never produced any blossoms before, and this year only upon one small limb, which produced one dozen bunches of flowers, nearly all of which were diseased, so that we think by the first of July the limb will have turned as black as if it had been scorched by fire.

"Amputation is the only remedy known at present. As soon as the disease is observed, the limb should be cut off below where it can be discovered, in doing which the operator should remember that the smallest quantity of *virus* is sufficient to communicate it to a healthy part, if brought in contact between the bark and the wood; he should, therefore, be careful not to use an instrument for amputation which has been used to examine the diseased parts, unless it has been thoroughly cleansed.

"We have been thus lengthy in regard to this disease because it is one of vital importance to every farmer who would cultivate a valuable orchard or is fond of this delicious fruit. Every Pear tree in this section of the country will be cut off by it unless exertions are made to check it."

We think favorably of Mr. Goodsell's theory, which appears to be supported by his experiments in communicating the infection from one tree to another as above mentioned. This theory nearly coincides with the opinion of Judge Buel, who in an article on "Fire Blight" published in the *New England Farmer*, vol. vii. page 137, gave the following observations:

"My theory is that the new disease of the pear and apple trees, like that of the plum and Morello cherry, is occasioned by an insect, which injects a matter through the bark that poisons or vitiates the descending sap, and causes disease and death. And my reasons for this opinion are briefly,—

"1. That the progress of the disease is down with the elaborated or proper sap towards the trunk and root, and not up with the ascending sap towards the extremities and leaves; that it is perceptible to a greater extent on the cambium, and inner bark, than on the exterior surface. The former will be found brown, in longitudinal slips, sometimes an inch lower than the exterior is affected. The sap frequently continues to ascend, is elaborated and nourishes and preserves the verdure at the extrem-

ity, after the branch is affected, and the whole circle of the bark below has become brown and withered; and in these cases it is not until the sap-wood under the blighted part is contracted by disease, and refuses to perform its office, that the extremity perishes.

"2. That the commencement of the disease, from what I have stated, is in the descending sap, is communicated next to the bark, and finally to the wood.

"3. That it is most common in thrifty branches, tender bark, and new wood. And

"4. That it appears only when the sap is in full flow, and vegetation luxuriant; and extends in proportion to the vigor of circulation and growth.

"What the insect is that does the mischief, I will not pretend to determine. I have seen insects, in the morning, so firmly attached to a branch, (at the commencement of the new growth,) of an apple tree, that cutting off the limb did not disturb them; and at evening I have found many of them enveloped in the dead and curled leaves of a branch which they had probably destroyed in part. As I am no entomologist, I submitted them to a gentleman of science, who gave them the generic name of *saperda*, the specific name not being known.

THE SEASON IN MAINE.

Extract of a letter from the Proprietor of the N. E. Farmer, now travelling in the State of Maine, to the Editor.

The State of Maine has now, July 20th, a beautiful appearance. Hay crops are good. Corn has improved rapidly, and the prospect is quite favorable for the farmer. The country between Augusta and Bangor is under very good cultivation, and there are some most excellent farms in this part of the State, especially in Vassalborough and Dixmont. Indeed there is nothing wanting throughout the State but a still more general and extended circulation of the *New England Farmer*, to make Maine a great Pattern Farm, inviting and rewarding the inspection and imitation of cultivators generally throughout the Union.

Mow your Canada Thistles. Now is the time to cut down this troublesome enemy and prevent its going to seed. Every part of the farm and every highway and byeway should be visited with the scythe, and every thistle cut and raked up and put into the *Hogpen*; or if there should chance to be any that have been out of blossom a little while, these should be burnt, for the seed will draw nourishment enough from the stalk to ripen it, and multiply itself on the wings of the slightest breeze, ten thousand fold. Hundreds of loads of Manure might be made from it in some places, and this manure converted into something valuable. Now is the time, UP, UP, UP AND BE DOING.—*Maine Farmer.*

ITEMS OF INTELLIGENCE.

FRANKFORT, Ky. July 9.

Cholera. We are still under the necessity of filling columns with accounts of the progress of this disease. It still prevails extensively in many parts of the state, and we hear daily of the deaths of some of our useful and enterprising citizens. The summer of 1833 will long be remembered by the people of Kentucky, as the year of mourning and distress. No country has suffered more, and no country had reason to expect a lighter visitation from cholera. Here, there is nothing in the habits of the people,—in their diet,—or in the climate, tending to produce unusual mortality—on the contrary, the abundance of food—the cleanliness of the people, and the purity of the air, have heretofore rendered Kentucky remarkable for health.—*Commonwealth.*

A woman at St Louis, Missouri, supposed to be dead, was put into her coffin, and the lid fastened down; but happily, before her interment, she revived, and, at the last date, was convalescent and likely to recover.

Bark. We understand that such is the scarcity of the best kind of bark used by tanners, that the kind usually denominated Spanish Oak will readily command from \$20 to \$21 a cord. The scarcity of the article has interrupted the regular business of several tanners.—*N. Y. paper.*

Masons. There is a great scarcity in this city of bricklayers and stone masons, even at 15 shillings a day, now the wages. This fact is mentioned, that those out of employ in other places, may know where to find work and good wages.—*N. Y. Gaz.*

A machine has been invented in Cincinnati for cutting wheat, or any other small grain, by horse power. It is stated that it will, when propelled by two horses, cut as fast as eight persons can bind. A fair trial has been made of it, in the presence of several members of the agricultural society of Hamilton county. It met their fullest approbation, and the editor of the Cincinnati Advertiser, who has seen the machine, expresses the opinion that it may be applied to cutting grass also. This, if it proves fully successful, is an important invention; but so many novelties have been brought forward of late, and so few have answered the expectations at first held out of their utility, that we are disposed to be somewhat cautious and incredulous.—*U. S. Gaz.*

Singular Fact.—A Frankfort, (Ky.) paper says:—"In many parts of this country chickens and other fowls have died in great numbers with all the symptoms of cholera. A gentleman of our acquaintance administered spirits of camphor to several chickens which were apparently near death, and they instantly revived and speedily recovered."

MARKETS.

Hay. The prospect of a fair average crop in our own immediate neighborhood has been much more favorable of late, and the anticipated advance on Eastern prices is not likely to be realized.

Wool. There have been some operations in Domestic Wool during the week at our quoted rates. Wool of the new clip is coming in freely.—*Courier.*

The Vegetable Market is now abundantly supplied with all kinds of early vegetables and fruit.

REAL ESTATE FOR SALE.

THE subscriber offers for sale his valuable Real Estate in the town of Palmelia, on the Black River, opposite the village of Watertown, in the county of Jefferson, state of New-York, consisting of a Saw Mill, Flouring Mill, with four run of Burr Stones in good orders, Machine Shop and Distillery, and is one of the best hydraulic privileges in the State.

Also, six small Dwelling Houses, with suitable out-houses.

Also, one large two story DWELLING HOUSE, with a barn and all other out-houses attached to it that are necessary, with a garden extending to the banks of the river.

Also, about three hundred acres of first rate Land, lying over one mile on the river and road leading from Watertown to Brownville; about one half is under cultivation, and the remainder is good wood land.

The above property will be sold at auction on the first day of October next, (unless sooner sold at private sale,) in such parts as may suit purchasers. Two-thirds of the purchase money may remain two or three years on bonds and mortgages. Those who wish to make good bargains would do well to call and examine the premises. Any information that may be wanted can be had by applying to the subscriber at Watertown. J. FOSTER.

July 24.

GRAIN CRADLES.

FOR sale, at the AGRICULTURAL WAREHOUSE, No. 52 North Market street, a few of Willis' improved GRAIN CRADLES, a superior article. J. N. NEWELL.

July 10

TURNIP SEED.

For sale at the N. E. Seed Store, 51 & 52, North Market Street,

Early Dutch Turnip. Early Garden Stone do. Yellow tone do. White Flat Winter do. Long Yellow French do. Yellow Aberdeen do. Ruta Baga do.

The two last are very excellent kinds for cattle.

WANTED,

Wanted, 1000 Boxes Red Raspberries. Inquire at the Farmer Office. 3w July 17

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5 1/4 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chesauts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pionies, Moutan and Papaveracea—and 24 other kinds—and 33 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

NEW AMERICAN ORCHARDIST.

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

YOUNG FLORIST'S MANUAL.

JUST Published and for sale by GEO. C. BARRETT, 51 & 52 North Market Street.

THE YOUNG FLORIST'S MANUAL, or a description of the Plants usually cultivated in the Flower Garden with their Habits and Modes of cultivation. The whole being a compilation from the best Authors, and intended for Common use—price 37 1/2 cts. J 19.

FOR SALE,

AT the Agricultural Warehouse, 50 1/2 North Market Street, Harris' Patent PAINT MILLS, being a great improvement on the common Paint Mills now in use, and are calculated for grinding all kinds of paints—as they are easily cleaned, and no way liable to get out of order.

Howard's Improved expanding CULTIVATOR. The Cultivator is well adapted to free and easy drill cultivation, and much approved for various purposes—as it works very easy, and leaves the ground light and free, for Hoeing, and for cultivating corn, potatoes, &c.

Howard's Double Mould Hand PLOUGH. This plough is calculated for furrowing out lands, splitting hills, ploughing between corn, potatoes and vegetable cultivation, to great advantage, and is a great labor saving machine.

Davis' Patent Road and Dirt SHOVEL. This Shovel is made much in the common form, but much improved by being shod with Iron something in the shape of a Ploughshare, and on an entire new plan. Jy 24

FOR SALE,

THAT valuable country seat and farm formerly owned by E. H. Derby and J. Crownshield, Esqrs., and lately by Col. Endicott, situated in Danvers, within two miles of Salem and fifteen of Boston. The buildings are in good repair, spacious and elegant, and convenient for a genteel family, and also for a farmer's, with barns, stables, &c., attached. There is an excellent garden, containing a great variety of choice fruits, shrubs and flowers and a tasteful summer house. The farm is in a high state of cultivation, well watered and enclosed—it produces large crops of hay, grain, and vegetables, besides apples, pears, peaches, apricots, plums, quinces and cherries; there is a nursery of young fruit trees, and a plantation of 5000 White Mulberries. The place has many advantages, and is the most desirable country retreat in the vicinity. The building and garden, with from 10 to 100 acres of land, as the purchaser may choose, are offered on liberal and accommodating terms. Apply at this office, or to AMOS KING, Danvers, March 27, 1833.

BRIGHTON MARKET.—MONDAY, JULY 22, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day 376 Beef Cattle, 14 Cows and Calves, and 2240 Sheep. About 110 Beef Cattle remain unsold.

PRICES. Beef Cattle.—Prices well supported from last week, particularly on the Cattle. We noticed a yoke or two which were taken for something more than \$6. We quote prime at \$5 50 a 6; good at \$5 a 5 25; thin at \$4 a 4 75.

Cows and Calves. Sales were effected at \$11 25, 14, 21, 22, 25, 30 and \$38.

Sheep and Lambs.—Lots were taken at \$1 54, 1 71, 1 92, 2 00, 2 17, 2 25, 2 37, 2 50, and \$2 67.

Swine.—None at market.

NEW ENGLAND FARMER COMPLETE.

For sale at the New England Farmer Office a complete set and the last of the N. E. Farmer in 11 volumes bound, the whole containing 4570 pages, with a copious index to each vol. Price 3.75 per vol.

MISCELLANY.

For the New England Farmer.

HAPPINESS. A Song.

No glory I covet, no riches I want,
Ambition is nothing to me;
The one thing I beg of kind Heaven to grant
Is a mind independent and free.

With passions unruffled, untainted with pride,
By reason my life let me square;
The wants of my nature are cheaply supplied,
And the rest are but folly and care.

The b'lessings which Providence freely has lent,
I will justly and gratefully prize;
While sweet meditation, and cheerful content,
Shall make me both happy and wise.

In the pleasures the great man's possessions display,
Unenvied I challenge my part,
For every fair object my eyes can survey
Contributes to gladden my heart.

How vainly, through infinite trouble and strife
Mean misers their labors employ,
Since all that a happy man needs in this life
Is what all if they please may enjoy.

MAXIMS FOR MARRIED LADIES.

THE following maxims, if pursued, will not only make the men in love with marriage, but cause them to be good husbands: First, be good yourself. Avoid all thoughts of managing a husband. Never try to deceive or impose upon his understanding, nor give him uneasiness; but treat him with affection, with sincerity and respect. Remember that husbands, at best, are only men, subject like yourselves to frailties. Be not too sanguine, then, before marriage, or promise yourselves happiness without alloy. Should you discover any thing in his humor or behavior not altogether what you expected or wish, pass it over, smooth your own temper, and try to mend his by attention, cheerfulness, and good nature. Reproach not him with misfortunes, which are the accidents and infirmities of life—a burden which each has engaged to assist the other in supporting, and to which both parties are equally exposed—but instead of murmurings and reflections, divide the sorrows between you; make the best of it, and it will be easy for both. It is the innate office of the softer sex to sooth the troubles of the other. Resolve every morning to be cheerful throughout the day—should any thing occur to break your resolution, suffer it not to put you out of temper with your husband. Dispute not with him, be the occasion what it may; but much sooner deny yourself the trifle of having your own will, or of gaining the better of an argument, than risk a quarrel or create a heartburning, the end of which it is impossible to see. Implicit submission in a man to his wife, is ever disgraceful to both; but implicit submission in the wife, is what she promised at the altar, what the good will revere her for, and what is in fact the greatest honor she can receive. Be assured that a woman's power, as well as her happiness, has no other foundation than her husband's esteem and love, which it is her interest, by all possible means, to preserve and increase. Study, therefore, his temper, and preserve your own. Enjoy with him satisfaction, share and sooth his cares, and with the utmost assiduity conceal his infirmities.—*American Farmer.*

If all the fools wore white caps we should look like a flock of geese.

EARLY FRUGALITY.

In early childhood you lay the foundation of property or riches, in the habits you give your children. Teach them to save every thing, for some good use,—and teach them to share every thing with their playmates, but never allow them to destroy any thing. I once visited a family, where the utmost economy was observed; yet nothing was mean or uncomfortable. It is the character of true economy to be as comfortable, with a little, as others can be with much. In this family when the father brought home a package, the children would of their own accord, put away the paper and twine neatly, instead of throwing them in the fire or tearing them to pieces. If the little ones wanted a piece of twine to spin a top, there it was in readiness; and when they threw it upon the floor, the older children had no need to be told to put it again in its place.—*Frugal Housewife.*

SELECT PROVERBS OF ALL NATIONS.

If you trust before you try, you may repent before you die.

If things were to be done twice all would be wise.

If wise men play the fool, they do it with a vengeance.

If you would have a good servant, take neither a kinsman nor a friend.

If a fool have success it ruins him.

If it were not for hope the heart would break.

If you can bite never show your teeth.

Ill got, ill spent.

If you would wish the dog to follow you, feed him.

If you lie upon roses when young, you'll lie upon thorns when old.

If you had had fewer friends and more enemies you had been a better man.

If you would have a thing kept a secret, never tell it to any one; and if you would not have a thing known of you, never do it.

I wept when I was born, and every day shows why.

I love my friends well, but myself better.

Ill-will never spoke well.—*Scotch.*

Discovery of the Longitude. It is well known that to find the longitude at sea, is a difficult operation, and rewards have from time to time been offered for the discovery of a certain and easy method. In 1714 the British Parliament offered £20,000 reward, but in 1828 the act was repealed. Capt. Shain, of Cincinnati, now claims the honor, and says he has constructed a mathematical figure, which, if you have the latitude and the bearings of an object, will give the required longitude.

Why are the turnip, the radish, and the cabbage considered very wholesome? Because of their high antiscorbutic powers, which depend upon a certain acrid volatile oily principle. This is particularly abundant in the seeds of mustard, and the roots of horse-radish; and in less degree in scurvy grass and the roots of the radish. Plants of this order are also believed to possess diuretic and diaphoretic properties; and they are always eatable when their texture is succulent and watery, as in the roots of the radish and turnip, and in the leaves of the cabbage tribe.—*Loudon.*

"It is believed," says the Edinburgh Review, in an article of Babbage on machinery and manufactures, "that an individual can at this moment,

by means of the improved machinery now in use, produce about two hundred times the quantity of cotton goods than an individual could have produced at the accession of George III. in 1760."

WHOLESALE AND RETAIL CASH STORE.

ELIAB STONE BREWER, No. 414, Washington Street. (South end) has received a general assortment of *Spring and Summer Goods*, among which are 100 cases English, French and American Prints of all prices and qualities—20 cases Petticoat Robes—1 case Cambric Muslins, some of which are very fine—1 case Cotton Cambrics do. do.—1 case White Lilies for lining ladies dresses—1 case Book Binders' Cambric for do. do.—cases do.—100 cases bleached and brown Sheet and Shirting, some extra fine—1 case Marseilles Quilts, from 6 to 10 quarters—5 cases London Rose Blankets, some of a very superior quality and large size—1 case Hearth Rugs—1 case Lepp's spool 6 cord cotton, warranted—200 yards superior quality—5 cases Clark's do. at very low prices by doz. or case—300 fancy boxes—a large variety of colored and black French Silks at very reduced prices—2 cases cold Batiste—1 case black and colored Barage—4 cases French and London printed Muslins of new patterns and beautiful colors—2 cases three corded superfine Italianettes, black and fashionable colors—1 case common do.—1 case Plaid Palmgren's super quality—1 case Pou de Soi a genteel article for ladies' summer dresses, 9s per yd—20 ps super mix'd, drab, and olive Merino Cassinets for children's summer dresses—20 ps Rouen Cassimere with a large variety of superfine and fine Broadcloths and Cassimeres—20 bales Pelisse Wadding—3 cases superior Ticking—4 cases cheap do.—10 cases improved soft finished Irish Linen, manufactured for the London market and imported expressly for the subscriber.

The above goods are offered for cash only at prices so extremely low as will make it an object for purchasers either by piece or yard to call and see. May 29

PEMBROKE BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butter Salt. 6600 loaves Table Salt. Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale. June 5 CHAS I. CAZENOVE & CO.

TO SUBSCRIBERS.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half-bound and lettered, a 75 cents per volume, by leaving them at the Farmer Office. July 17

FARMER'S OWN BOOK.

For sale at the New England Farmer office the *Farmer's Own Book or Family Receipts*. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 50 cents. Also, the *FRUGAL HOUSEWIFE*, by Mrs. Child, dedicated to those who are not ashamed of economy,—a work which should be in every family. Price 50 cents.

GENTLEMAN'S POCKET FARRIER.

For sale at the Farmer Office, showing how to use your Horse on a journey; and what remedies are proper for common accidents which may befall him; by F. Tutinell, Veterinary Surgeon. Price 15 cents. July 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

COMMUNICATION.

For the New England Farmer.
AMERICAN COTTON MANUFACTURES.

Brookline, July 22d, 1833.

MR. FESSENDEN—In your paper of 17th current, under the head of "*Capabilities of Machinery*," is an article, taken from the London Mercantile Journal, in which it is remarked, that "*One Mill in Manchester, can, when all the spindles are at work, spin as much Cotton thread in a WEEK, as would go round the world.*" The number of spindles are not mentioned, and the size of the Factory alluded to, cannot be judged of without that knowledge. Some of the factories at Manchester, are known to be on a scale much more extended than any single one in our own country: They are, I believe, generally confined to *spinning*; the *weaving* being done elsewhere. I do not wish to be understood, in the observations which I make, to pretend to make a comparison between the *whole operation* of England in her cotton manufactures and that of our own country; but to show, by what *is done at this time*, on a spot where ten years since was not a yard of cotton made, that if not thwarted by throwing open our trade to competition with foreigners on equal terms, *we may in time, and that not very distant*, supply a portion of the manufactured cottons of the *coarser kinds*, not only to the South American States, China and the Eastern Archipelago, but even to *Great Britain herself*.

It is notorious that in our manufactories, we use a *superior* raw material to make the goods; whereas the goods bearing the same denomination as those goods generally made in this country, manufactured in England, are made of the most *inferior* cotton that is imported into Great Britain. We cannot expect to vie with the great establishments of Manchester, in the finer goods; but in shirtings and sheetings, or of goods known as No. 14 or 16 goods in the language of the Factory, I entertain the confident opinion, that so long as the present protection is extended to the manufacturers the establishments will be maintained, and will have gained so much useful information, and got so systematized, as that at the end of ten years, *they will need no protection*. In the year 1828, the late mechanist, the lamented Paul Moody, at the request of the writer of this, ascertained the length of the thread spun at that time at Lowell; which every one knows may be done, with great exactness, by ascertaining the number of hanks spun at each factory in a day; which being all the same length, by a simple process gives the whole length of the thread. At the time to which I refer, there were in operation the following Factories, viz.—Merrimack Co. 4 Mills for spinning and weaving; Hamilton, do. 2 do. do. Appleton, do. 2 do. do. do.

8 mills of from 4200 to 5000 spindles each, and looms sufficient to weave the whole quantity of thread spun. The person referred to, sent the following result of his inquiry. "*That there were spun in the above eight mills, each and every week day, a thread that would go round the world five and a quarter times; and that the whole length of the cloth wove in a year, was eight thou-*

sand five hundred miles. At the present time there are at Lowell, the following spinning and weaving

| | | | |
|--------------------|---|---|-------------|
| Mills:—Merrimack | - | - | 5 |
| Hamilton | - | - | 3 |
| Appleton | - | - | 2 |
| Lowell | - | - | 1 |
| Suffolk | - | - | 2 |
| Tremont | - | - | 2 |
| Lawrence | - | - | 1 finished, |
| | | | 16 |
| and 3 in progress, | - | - | 3 |
| | | | 19 |

The above are in full operation, and the three mills now erecting, will be in full work the next Spring, making in all nineteen mills. There have been great improvements, both in machinery and gearing, since the first mills were erected; and those last erected produce a third more thread per day, than those first built. But taking the work of the mills at work in 1828 as the data, upon which to estimate the work that will be done when the three Lawrence mills, alluded to above, are completed, we shall find that there will be made, every day in the week, Sundays excepted, as follows: a thread will be spun *daily*, which if knotted together, would reach twelve and a half times round the world, and a piece of cloth woven of twenty-one thousand four hundred miles long, in one year. In 1828, there were about 13000 bales of cotton used at Lowell. In May 1834, the mills will require thirty thousand bales of cotton annually. It will be remembered, that the Merrimack Corporation print about 200,000 pieces of cloth per ann. and the Hamilton also print a part of what they manufacture.

Amongst the items of the produce of our country, used at Lowell, is eight thousand tons of anthracite coal, a large quantity of whale oil, and not a small quantity of iron. The number of inhabitants in 1822, was not an hundred; it is now more than 12000 souls.

As the Editors of papers are rather fastidious in copying from the papers of each other, should you think the information given above would be generally interesting, you may suggest to your brother Editors, that you should be pleased to have them copy it, particularly in the South, where they are not apt to attach much importance to the North as a consumer of their Cotton; whereas, Great Britain excepted, we manufacture more than any other country, of the Cotton of the Planting States.

A DORMANT MANUFACTURER.

From the Southern Agriculturist.

RULES FOR THE HOUSING AND PRESERVING OF SWEET POTATOES.

IN compliance with my promise, I herewith furnish you with the rules by which I have been governed for many years in putting up my potatoes. I have been very successful in following them, and I hope they may prove beneficial to others. The first thing to be considered is the cellar, and I would recommend—

1st. The rails or puncheons to be split in July, or the first of August, and stacked up for drying.

2d. The cellar to stand east and west, with the door in the centre and perpendicular, to face the sun the most part of the day.

3d. To be made on as dry and high a spot, and convenient for draining as possible, and made at least five weeks before wanted.

4th. To be double banked, by making a coarse frame to support the same. The earth to be taken four feet from the foot of the cellar all around, about three feet wide, eighteen or twenty inches deep; in this ditch never let any water remain, but keep it perfectly dry.

5th. To be supported inside by short crutches, standing three feet high with poles, or rails laid lengthways in those crutches. By thus supporting your cellar, it will last you two years with safety, by airing it. When your cellar is finished, small fires are to be made at each end, that it may be perfectly dry and clear of damp.

6th. The cellar to be perfectly tight, with no air holes left—to have two doors, one a tight door for the inside, the other a slat door hung on, and opening on the outside; the slat will admit the requisite air as much as it may be necessary.

7th. The pine-trash to be well dried as usual, and laid in the cellar six inches thick at least, and if dried a second day, it would be of advantage.

8th. To begin with your potatoes—make four sortments in the field; 1st, all that are the least touched with frost or chilled—2d, all that are cut—3d, seed—4th, eatable potatoes—to be harvested free from any kind of wet or rain, and brought in by sunset, and on no consideration move them a second time, but put them where you intend to keep them from the first move out of the field.

9th. On commencing your housing, small fires to be made in any thing convenient, say a large pot, with a little earth in the bottom, every evening, until all are housed; your slat door then to be used, leaving the inner one open, and admit the air freely every morning, but shut in time, say two or three hours before sunset.

Now, having housed your crop, you will find considerable damp, but not detrimental, if you will pay attention to it, which is one of the principal secrets to be observed. On seeing this in a moist morning you must have a small fire or a smoke of light wood or pine bark made, to clear up this damp; and sometimes a second fire will be requisite, of which you will be the best judge when sufficient. Observe to keep the tight, or inner door, open at the same time, and they will soon become cool. In a state of moisture your potatoes will remain for ten or twelve days. After this you will find them become more cool and much less damp in your cellar, which you should examine every morning. About this time you will find them sprouting; then you are sure of their keeping. But little trouble is now required—only, on seeing the damp, to make a little fire and open your inner door for air. The sprouted part of them is only on top of the heaps, not more than five or six inches deep: on examination, you will find the inner or lower part of them clear of sprouts, and dry. In my opinion, slips may be kept thus for two years; and root potatoes much longer than they generally are in our country.

The slat (of which the doors are made) is about two and a half inches in width, and the same between each slat to be open. The door is about five feet high and two feet six inches wide.

A coarse frame is made with crutches for double banking.

Your obedient servant, JOHN M. PHILLIPS.

Note. The plan here laid down by our correspondent, has been successfully followed for many years, and we have been shown potatoes kept more than a year by him, in these cellars. Our readers will recollect that another of our correspondents experienced great benefit from the use of smoke in his cellars, and from all we can learn, we are inclined to believe, that they may be kept longer in a sound state by following these rules, or similar ones, than any other mode in common practice among us.—*Ed. So. Agr.*

From the Columbia Sentinel.

ON GYPSUM AS A MANURE.

LAST week we ventured some observations on the proper time for sowing gypsum. This week we propose to go into a consideration of the question of the *usefulness* of gypsum as a manure.—There is the more necessity for this, from the fact that a controversy is now going on upon this subject in the *Genesee Farmer*—one contending for its use, another denying that it is ultimately beneficial to the soil after a few applications. If we turn to the ninth volume of the *Agricultural Magazine*, we will see that comparative trials were made between this and other manures, on a stoney clay, mixed with a little loam, to ascertain the best manure for wheat. "A five acre field was divided into five equal parts, exactly an acre in each. They were equally well ploughed and laid down to wheat, after being manured as follows;

On No. 1 was sown 6½ bushels of gypsum.

On No. 2 was put a compost manure, consisting of lime, rich earth, and dung.

No. 3 was manured by yarding cattle on it.

On No. 4 stable dung was thinly spread.

On No. 5 lime prepared from oyster shells was sown.

The product was from

No. 1, forty bushels,

No. 2, thirty-six bushels,

No. 3, thirty-five bushels,

No. 4, thirty-three bushels,

No. 5, thirty bushels.

The seed wheat was of the best Sicily kind, and weighed 62 lbs. per bushel—the product weighed 63 lbs. per bush.

Next follow eight different experiments of the effects of gypsum on the different grasses, excepting clover. In all cases the quantity of land was the same, and the soil as much alike as possible. The result uniformly proved that the profits were from 1-4 to 1-2 greater than where none had been used. On clover the benefits were still more marked. The gypsum used yielded per acre a product of hay equal to . . . 15

The ungypsumed only equal to . . . 5

The gypsumed yielded in seed per acre a product equal to . . . 30

The ungypsumed yielded in seed only . . . 5 1-2

The experimenter adds—"The invariable result of the several experiments, which are faithfully and he trusts correctly stated, he thinks incontestibly prove that there is a most powerful and subtle principle in this tasteless stone; but by what peculiar agency or combination it is capable of forcing vegetation in such an instantaneous and astonishing manner, time reserves for others to unfold."

From the above experiments, it is distinctly as-

certain that gypsum produces its greatest effects on clover. Time and experience have confirmed this fact, and it is now generally understood that as manure it is not so beneficial to the narrow-leaved as it is to the broad-leaved plants, such as clover and corn. Besides the above experiments the general observation of farmers is conclusive on this point, and we could quote abundance of authority in proof of this position. I have seen one half of a field which had clover growing in it sown with plaster and the other part remaining unsown. The eye could distinctly trace the part sown from the part unsown. First, from the increased size of the one, and next, from the sickly and yellow appearance of the other. The line of demarcation was so observable, that the cause of it was a frequent source of inquiry. But this is only one among many similar instances. My own experience and that of my neighbors fully bears me out in the opinion likewise, that clover, to come up well and do well must be aided by having the ground sprinkled with plaster as soon after it sown as practicable. This is an experiment which I have frequently made, and have long since looked upon as a settled principle in farming.

Previous to the use of plaster and clover as a manure, (for they ought to go together,) what is now called the best land in this vicinity might have been purchased for less than \$3 per acre; and I have heard of several purchases being made at less than one dollar. Now this land is made to yield the interest of \$100 per acre, free of expense,—is constantly improving, and there are no farmers who thrive so well as those who are the most lavish in the application of these two manures. I verily believe, deprive them of the use of clover and plaster, and their farms would degenerate, if not as low as formerly, still so much so as to make their cultivation very unprofitable. Plaster does not do its maximum of good without it is sown on clover; and clover will not grow luxuriantly unless it is sprinkled with plaster—they mutually aid each other, and when both are freely used they are a mine of wealth to the farmer. It is not because he has large crops of clover for hay, but this clover being turned under by the plough, is the best possible coating of manure that his fields can have to bring him heavy crops of wheat, corn and oats; not rye—his land is too good for it—it is too cheap a produce when wheat, which is more profitable, may as easily be raised. It is principally indirectly therefore that gypsum is so valuable as a manure. We are perfectly willing to concede that its good effects are not so distinctly marked as formerly; the poverty of the soil made it then so peculiarly grateful to it that it at once yielded a hundred fold. Now the quality of the soil having materially improved by its frequent application, they are not, of course, so observable. It ought to be enough for us that crops are growing more and more abundant. It is the proof that something is at work in farther fertilizing the soil.

The sowing of gypsum has produced another and great revolution in farming, and materially lessened the labors of the farmer. It is by making it unnecessary for fields to lay a season to fallow, by which not only the use of the land is lost for the season, but you save the labor of ploughing it two, and often three times, for a subsequent crop of wheat. How much simpler and more profitable the process now. One year you sow your

field with oats, barley, &c., in the spring, at the same time you put on your clover seed and plaster. The subsequent year you have a fine field of clover, enough to cover the ground completely, and affording abundance of food for your stock for grazing. You fatten them at the same time that you fatten your soil. The coming autumn the remains of the clover are turned under with a single ploughing—you sow on your wheat—apply your drag, and your work is done. The chance is, you will have a much better crop than by the old method of frequent ploughing and fallowing, even if you have added to your fallow land a thin covering of stable manure. When clover can be made to grow so thrifty as to crowd out all other plants, which is frequently the case, it is the best preparation that our soil in the present state of farming can possibly have. But it must have only one ploughing. The clover lay well turned over, must be permitted to remain there according to modern experience, and a heavy crop of wheat or corn is almost the invariable result. A.

From the Genesee Farmer.

CANADA THISTLES.

IN No. 9, page 66, of the present vol. of the *Genesee Farmer*, I gave an effectual receipt for destroying that pest to agriculture, the Canada Thistle, and which in its application may be said not to cost any thing, for it prepares the thistle patch in a most capital manner for a luxuriant crop of wheat. I would again call the attention of my brother farmers to the subject, and to convince the most skeptical of the complete efficacy of it, I will relate one case among many where it has been attended with complete success, and where they may go and examine for themselves.

Mr. Daniel Wilson of Covington, in this county, (Genesee) having seen the beneficial effects of the method, as practised by my brother on his farm, (and described as above referred to) resolved to try it on a most incorrigible patch of it, that had been surrendered up to the thistles for twenty years, and which were extending themselves in all directions, threatening to take entire possession of the farm. Pursuant to the directions of my brother, in the summer of 1832, he commenced ploughing them, and he found the roots of the thistles forming a complete mat or basket work, thickly crossing each other in all directions and to unknown depths. He ploughed the ground at regular intervals of four weeks for four successive times, when after the fourth ploughing, there was not a thistle to be seen, and the ground was in fine tilth for sowing wheat, loose and nice enough for any garden vegetables, and now, July 1833, there is a most luxuriant crop of wheat on the old thistle bed, and not a solitary thistle has been found, although it has been carefully examined by those interested in testing its efficacy.

I cannot but hope that another season, all afflicted with this most troublesome of all weeds, will try it, and by following the course, and doing the work thoroughly will drive it from the land.

Le Roy, July 9, 1833. THOMAS TUFTS.

IMPROVED HARROW AND SEEDING MACHINE.

WE experienced much gratification last evening, in examining the model of an Agricultural Machine, for which a patent has lately been taken out by Capt. James D. Woodside, of Washington, the inventor. It is a revolving Cylindrical Harrow, with a contrivance for casting seed of every

description with uniformity. The machine, when used, is fastened to a common cart, drawn by two horses, and is so contrived that it may be attached to, or detached from the cart in a few minutes. One advantage, therefore, in this implement for harrowing is, that the power of the horse is horizontally applied, which is not the case with the common harrow; and another great advantage is that the rotary motion of the harrow prevents it from becoming clogged, and the teeth can be set, with ease, in such a manner as to penetrate the ground from one to eight inches in depth. In the rear of the cylinder there is a roller attached, for rolling in the grain; so that at one operation the ground may be harrowed and pulverized, and the seed cast and rolled in, with no other trouble than that of driving the horses, and replenishing the hopper which supplies the sieves. The sieves are of various grades, according to the manner in which the seed may be required to be cast, upon a poor or rich soil.

We have read the testimonials of several gentlemen of agricultural experience, who have examined the machine; and who are of opinion that it is well adapted for practical purposes. We understand that one of the machines is now at the Exchange for exhibition.—*Balt. Gaz.*

From the American Farmer.

ROBBING GARDENS, ORCHARDS, &c.

The practice indulged in by boys, and encouraged too often by parents, of entering gardens and orchards and robbing them of fruits, flowers, &c. has become a most serious evil in the vicinity of Baltimore, and we wish particularly to call the attention of parents and guardians to it. We have occupied a considerable garden with fruit trees in it for many years, and can assure the reader, that while the evil alluded to continues, we consider the existence of fruit trees in our garden, as a misfortune. On the Sabbath, particularly, it is necessary to keep a continual watch, from the time the fruit is formed, till it is gathered, or the boys will be sure to carry it all off. This is the case also at night, and more or less every day in the week. What little fruit is at last secured, therefore, costs more than it is worth. The loss of the fruit is not all. The breaking of fences, and trampling the garden, or crop in the field, necessarily incident to it, are fully as detrimental as the robbing of the fruit.—Many foreigners, also, commit these depredations, supposing as they say, that *this being a "free country"* all fruit is free to them. We were actually told by a foreigner some time since, whom we caught carrying off about a peck of our best fruit, that he thought in this country all fruit was common property. Now, so long as this thieving disposition of boys, (old and young, large and small,) and this mistaken notion of foreigners, continue, it will be impossible for gardeners in the vicinity to supply us with fruit. How strange it appears, upon reflection that boys can conscientiously *steal fruit*! They would be horror struck at the idea of being supposed capable of stealing a "fippeny bit," and yet never consider that the fruit they are taking is just as much property as the money, and indeed, more so, because it is the property itself, while money is the mere representative of it, and is freely given away for mere trifles. Fruit is as much the property of the owner, as is his horse, or his cow, as much so as is the furniture, made by the cabinet maker, or any other article made by a mechanic. It is, therefore, just as criminal to steal fruit as it would be to steal a watch, or even the

money from the draw of the storekeeper. But with people of common sense it will be needless to argue this point: they cannot be mistaken on a question so clear: if they have doubts let them become the possessors of fruit trees, and their doubts will vanish. In the northern states laws have been passed particularly for the suppression of this evil, and there it is very fast declining. We think our laws if deficient in this respect should be modified to meet the contingency; but we prefer seeing it accomplished by public opinion, and for this purpose we have penned the present article. To remove all doubts as to the law in the case, it has been determined by a few fruiterers, *to prosecute the boys and their parents and guardians, and also the foreigners both in the criminal court for stealing and in the civil court for trespass, until the evil in their case shall be removed; and it is desirable, that parents, guardians, masters of apprentices, and all others concerned, be put upon their guard, for they may be assured, that the full extent of the law will be enforced without respect to persons.*

We have thought it advisable to call the attention of the citizens of Baltimore to the subject in this way, that they might take measures to save themselves and families from the consequences—It is particularly desired that all the city papers will copy this article with the same view.

ARABIAN HORSES.

WHEN the Arab falls from his mare, and is unable to rise she will immediately stand and neigh, until assistance arrives. If he lies down to sleep, as fatigue often compels him to do in the midst of the desert, she stands watchful over him, and neighs and rouses him if either man or beast approaches. Man, however, is an inconsistent being. The Arab who thus lives with and loves his horses, regarding them as the most valuable treasure, sometimes treats them with a cruelty scarcely to be believed. The severest treatment which the English race horse endures, is gentleness compared with the young Arabian. Our horses would fare badly on the scanty nourishment afforded the Arabian. The mare usually has but one or two meals in twenty-four hours. During the day she is tied to the door of the tent, ready for the Bedouin to spring, at a moment's warning into the saddle; or she is turned out before the tent ready saddled, the bridle merely taken off, and so trained that she gallops up immediately at her master's call. At night she receives a little water, and her scanty provender of five or six pounds of barley or beans and sometimes a little straw; she lies down content in the midst of her master's family. She can however, endure great fatigue; she will travel fifty miles without stopping; on emergency 120; and occasionally neither she nor her rider has taken food for three whole days.

A MACHINE has been invented and successfully applied in Ireland, by which the water in green turf is entirely pressed out, and the combustible portion of the Peat made to occupy about one third its original space. It is rendered almost as solid as mineral coal, and as pleasant for fuel.

The annexed sentiment was given among the regular toasts at the celebration of St. George's day in Quebec: "England and the United States of America—may the Atlantic which rolls between them, be always a Pacific ocean."

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS AT THE MASS. HORT. SOC. ROOMS.

Saturday, July 27, 1833.

APPLES. White Juneting (Cox No. 1,) from John Prince, Esq. E. Bartlett, Esq. and R. Manning; a great bearer, ripens a few days before the Harvest to which it is much inferior in size and flavor. This appears to be the apple cultivated in England by the same name and described by Ronald, Plate 1st, Figure 3d.

From R. Manning. Red Astracan, (Figured in Pom. Mag.) a poor specimen prematurely ripe.

From John R. Kenrick, Newton. Early Striped apple.

Early Harvest apples, from John Heard, Esq. Watertown, and John Prince, Esq. Roxbury. The specimens from Mr. Heard were larger than any ever before seen by the Committee, but there can be no doubt of their identity.

MADELEINE PEARS. From Mr. E. Richards, John A. Kenrick and R. Manning. These appeared to be the same, and are no doubt the Madeleine of the Pom. Magazine, and the Long Madeleine of the New Duhamel, but not the Madeleine of Cox, or the Old Duhamel.

From E. Bartlett, Esq. Green Chisel pears, distinct from the above.

From R. Manning, Little Musk Pears, (Cox No. 1.) the scions of these were received from New York as the Bleeker's Meadows.

From E. Breed, Charlestown. Fine early pears from a tree imported from France.

From R. Manning, Plumstone Morello Cherries.

From Messrs. Winship, Brighton. Specimens of 12 varieties of Currants, the same as exhibited last Saturday, with the addition of the Champaigne or Pale Red.

From the Same. Branches of the Shepardia or Buffalo Berry, loaded with Fruit.

From Thomas Mason (Charlestown Vineyard), a pair of Yellow Letter Melons.

From Tho. Whitmarsh, Brookline, Black Hamburg Grapes.

From Mr. S. Walker, Cambridge, White Whorleberries.

From S. G. Perkins, Esq. a splendid basket of Fruit, consisting of Grapes of several kinds, Nectarines and Peaches.

NOTICE. Persons who may have in their possession books containing plates with figures of Fruits belonging to the Library of the Mass. Hort. Society, are requested to send in the same.

By order of the Committee,

ROBERT MANNING.

Mr. Mason, of Charlestown, also exhibited some fine cucumbers of the long variety.

EXHIBITION OF FLOWERS.

S. WALKER, Roxbury; Dahlia Imperiosa; do. Le Brilliant; do. Well's Royal Lilac; do. Vesta; do. Lilac Tricolor; Dracocephalum variegatum; Penstemon alropurea; do. purpurea; Ibris Gibraltarica; Cimicifuga Foetida; Phlox shepherdia; Chelone carbata; Carnations; Coriopsis tenuifolia; do. grandiflora; do. auriculata; do. Canceolata; Statice tartarica; Veronica virgata; Monarda mollis; do. purpurea, &c. &c. &c.

THOMAS MASON, Charlestown Vineyard, Dahlias, and other kinds of Flowers, including carnations. JOHN HOVEY, Roxbury, Jasminum plenum.

Per order,

JONA. WINSHIP, Ch.

Extracts from "Transactions of the Essex Agricultural Society for 1832."

DAIRY.

THE Committee on the Dairy, report—that there was presented to their notice, on the day of the Exhibition at Newbury, but one parcel of Cheese, and five parcels of Butter. The cheese was offered by Moses Newhall of West Newbury, and for which they award the Society's second premium of *ten dollars*.

They regret exceedingly, that in a county where there are so many good farmers, that make good cheese, there should be so few willing to exhibit it.

But three of the parcels of butter exhibited came within the rules prescribed for the premiums.—These were offered by Mrs. Betsey Parker of Andover—Hector Coffin of Newbury, and Ralph H. Chandler of Andover. The butter exhibited was of good quality.

They have awarded to

Mrs. Betsey Parker, 1st premium, 12 dollars.

Hector Coffin, 2d " 10 "

As the condition on which some of the premiums on butter were offered, did not admit of their closing their Report on the day of the Exhibition, they have waited until this could be done with propriety.

There was but one claim entered, for the premiums offered for the best produce of butter, in the six months next following the 20th of May, &c.—this by Hector Coffin, Esq. of Rock Farm, Newbury.

Mr. Coffin's statement, which is hereunto annexed, was satisfactory to the Committee; and the specimens of butter exhibited by him were of good quality; and his entire management of his Dairy affords an example worthy of imitation—and the committee award to him the Society's first premium, of *twenty dollars*.

All of which is submitted by JUSTIN SMITH,
DANIEL FOSTER,
Dec. 1, 1832. JESSE PUTNAM,

Hector Coffin's Statement.

GENTLEMEN—I OFFER you a sample of butter for premium, made on Rock farm, of exceeding one hundred weight, in view of both the premiums offered by the Essex Agricultural Society.

That of the June make, is in two stone pots; and that of subsequent manufacture in a tub, consisting of balls stamped.

The June butter was made from five Cows, all native bred, viz:—

| | | | |
|---------|--------------|-------------------|-----------|
| Pink, | 8 years old, | calve March 20th, | } 5 Cows. |
| Violet, | 11 " " " | 28th, | |
| Daisy, | 12 " " " | 29th, | |
| Strady, | 12 " " " | April 17th, | |
| Flora, | 12 " " " | 17th, | |

All of which had their calves disposed of before the first of June; and on the 15th I added to their number a three years old heifer just deprived of her first calf; which animal I called Rose, in lieu of one by that name I sold in April. From these five cows and heifer, within the prescribed limited time, 181 lbs. butter was made. The quantity made during the season thus far is near 500 lbs., and will be stated exactly at the expiration of the six months after the 20th of May last.

To the five above cows we added, as above stated, heifer

| | | | |
|--------|--------------|---------------|---------|
| Rose, | 3 years old, | calved in May | } Three |
| Flirt, | 3 " " " | May 26th, | |
| Fanny, | 2 " " " | June 3d, | |

Heifers.

From the above five cows and three heifers, about 800 lbs. of different kinds of cheese have been made.

The above cows and heifers are all from native breed. Their keeping in the summer is common pasturing; and in the winter they are fed with fresh meadow hay and salt hay mixed, and never have grain or provender of any kind, except after calving in the spring, when they have a quart of meal mixed with water per day, and some better hay.

For butter, the milk is strained into earthen and tin pans, also zinc (but the women prefer the earthen); then set on the brick floor of a very cold dairy cellar and skimmed before turning sour; churning as often as requisite, twice or three times per week in Galt's patent churn, keeping the cream as cold as possible. As soon as the butter is gathered, the butter milk is immediately drawn off; the churn is immediately filled with cold water from the well, and the butter well washed by churning a few minutes; then taken out, after standing to cool, and passed through the operation of salting and first working, when it is put in pans on the dairy cellar floor for the day and night, and next morning thoroughly and completely worked, and packed down into stone pots, or made into balls for stamping; when cool, stamped; and if to be kept, put down in pickle.

N. B. The best pickle is made of washed Turks Island salt, and saltpetre, with a proper proportion of loaf sugar.

I am very respectfully, your obedient servant,
HECTOR COFFIN.

Newbury Rock Farm, Sept. 27, 1832.

N. B. The pans are washed after use, and then boiled in a cauldron (of pure water) and cooled (in the shade) before milk is again strained into them.

The churn is filled with cold water over night, before use; and washed with boiling water after churning.

Newbury Rock Farm, Nov. 20, 1832.

GENTLEMEN,—Agreeably to the foregoing duplicate of statement placed before you the day of the cattle show, I now subjoin the required statement necessary to obtain the premium on butter made the next six months after the 20th May, ending this day; together with a continuation of the system in making butter in cold weather. The whole quantity of cheese is no more than before stated, and butter to this day as weighed and accounted for by my dairy woman, as churned, is seven hundred and seventy one pounds.

Our average family through the season has been equal to ten persons, for whom milk has been used as required, without limit.

Since cold weather, the system of butter making has been altered. The first of October the milk was set on shelves in a room above ground, and the same process of making the butter continued as long as the warm weather lasted; after which, before churning, the cream in stone pots was set near a cooking stove for a day or two and made sufficiently warm to sour, when it is immediately churned, and the before mentioned process pursued. The souring of the cream, and churning it while in this state and warm, causes it to come quicker and to continue the yellow hue of summer, together with the flavor being much richer, and keeps longer sweet and sound. While the cream is near the fire, to be soured, it should be occasionally stirred.

My dairy woman in former seasons, where she has not had the advantage of the strong heat of a stove, has soured the cream by gently heating an oven, in which she has put the cream in tin pails, and continued an equalized heat by putting in fresh coals as occasion required till effected.

I am, gentlemen, very respectfully, your obedient servant,

HECTOR COFFIN.

N. B. The salt used, consists of one third clean washed Turks Island, and two thirds Liverpool blown salt; to every pound of which three quarters of an ounce of Saltpetre is added, and the whole mass finely pulverized and passed through a fine sieve; and one ounce of this mixture is used to every pound of butter in summer and nearly an ounce in cold weather.

From the Dublin Penny Journal.

AGRICULTURE.

If agriculturists are sometimes too hasty in adopting new and foreign ways, so on the other hand old farmer Jogtrot is a most provoking fellow. Thus have I known one of these wisecracks steadily adhere to the determination of never putting a scythe to his meadows till the first day of old July; another never reaps his corn until the harvest moon has attained a certain age, no matter whether the corn was shaking in the wind or not. It was in consequence of this principle, that an act of parliament was obliged to be enacted to hinder the Irish from making their ploughing cattle draw by the tail; and even in improved England, though certainly the instances are not so barbarous or mischievous, Good-man Steady still sends out his team of six monstrous horses, to plough a little sandy soil, three inches deep, thus wasting three times as much horse labor as he need, at an unwarrantable expense, what the Scotchman will do much better with a single pair of cattle.

In nothing is this adherence to old and bad customs so evident, as in the neglect of farmers in neither changing or steeping their seed corn, especially wheat. It is a well ascertained fact, that Irish wheat, as it is the worst sample, so it bears the worst price in the English market. Perhaps the dampness and coldness of our climate in common years is a great cause of deficiency in the quality of our bread corn; but certainly the fault is attributed to the want of attention in the change of seed—in the keeping of seed unmingled and unadulterated from seeds of weeds and from smut. I have seen in some of the southern counties of Ireland, especially Tipperary and Limerick, wheat that was grown on the sharp limestone soils that border on the Shannon, and the corn in itself was a beautiful and plump sample, but it was so mixed with smut and ribbry, as the seeds of the darnel or lolium, are there called, that it was almost unsaleable. I remember once calling on a tenant for his rent—which he had no just excuse for withholding, as the season was plentiful, and a fair market price for grain:—'Well, Tim, why don't you come in with your rent? You know I must do what is unpleasant if you do not settle, and that soon.'

'Why then, please your honor, it is I that am willing to pay the rent, and why should'nt I! but Master agra there's no price.'

'How, no price,' exclaimed I, 'I got the other day at Greyford mill, £1 18s. a barrel.'

'Oh the theiven rogue,' rejoined Tim Flannery, 'and amn't I after coming from the same miller, and by all the books in Father Kennedy's house, all h'ed offer was two-and-twenty.'

'Come, Tim, let me see your sample?' So going to the threshing floor, he produces a handful of wheat, which contained as many grains of ribbery and balls of smut, as of sound corn. Why, Tim, how could you expect to get a good price for such trash as this!

'Och, then, how can the likes of me help it? Hav'nt I put it through the wind in the mill twice; the wife has our best quilt all as one as spoilt, sunning it and picking it: 'tis a bad sample, please yer honor, but what can a body do, after doing his endeavor?'

'Tim, now for once be an honest man, and tell the truth. Did you ever in all your life change your seed, or did you ever steep your wheat before sowing?'

'Troth, sir, I never did. It's not for the likes of me to be going after these new fangled ways; my father, and he that went before him, did well without any such doings; this is the ould Irish red wheat, that is nathral to the land, and may be I'd have no crop at-all-at-all, where I to be making such ventures.'

'Indeed!—don't you see that my land is just the same as yours; but I manage a little better—keep the ground a little clearer—change my seed often—and always steep it to get rid of smut; and here is a sample of my red wheat, and observe that there is neither smut, ball or ribery, mixed with it, and it is therefore worth 16s. per barrel more than yours, because its tail is not as black as yours is.'

I cannot say that I was successful with Tim Flannery; perhaps I may be more so with the reader, if he have occasion to sow wheat; and the practice, as adopted successfully in Flanders, in the eradicating of smut, and which has also, to the fullest extent succeeded in Ireland, is this—To dissolve a pound of Roman vitriol, or blue stone, or sulphate of copper, in twenty gallons of water, in a vessel containing about forty gallons; steep as much wheat in it as will allow two or three inches of the solution to flow over the corn; then leave it, (skimming off the smut balls and light corn) for one hour, and then raise it and rinse it in common water, and dry it in the usual way with slacked lime. In this way a large quantity of seed wheat can successively be steeped; and it is only necessary occasionally, until our whole seed is picked, to add some more blue stone, dissolved in the same proportion of water, to make up for waste. With these observations I shall conclude my agricultural hints for the present.

From the Family Lyceum.

BREAD MAKING.

THE business of making bread, is not enough attended to in our country. The yeast is too often not perfectly sweet, and when it has become sour, alkaline substances, as saleratus, or pearlash, or soda, do not restore it to its original fitness for the process of fermenting the dough. Another defect is, that the dough when put into the oven, is frequently not enough, or too much fermented, the consequence of which is, that the bread is rather clammy or sour. Another, and almost universal defect is, that the bread is not baked enough. The thickness of the loaf may be too great for the heat of the oven; or the heat may be so great, as to burn or crisp the outside of the loaf, before the inner parts are done.

The whole vegetable kingdom is composed of three simple elementary substances, viz: oxygen, hydrogen and carbon. Of these three, starch is

composed. And starch constitutes a large part of most grains, and many roots; into some of the grains, especially wheat, and in less quantities of rye, another substance, entirely unlike starch, enters. This is called gluten, which is also composed of oxygen, hydrogen and carbon.

The starch and gluten composing wheat can be easily separated, either in grain or flour. The starch is soluble in water, and the gluten is not; consequently, if kernels of wheat be retained in the mouth a short time, the starch will be dissolved and removed, leaving behind the gluten. Or if a gill of wheat flour be put into a cup, and exposed to repeated washings, pouring off the water after it is applied, it will gradually dissolve, and carry off the starch from the flour, leaving the gluten by itself. The gluten is unlike starch in being insoluble in water, but it is tenacious and elastic resembling Indian rubber.

To the gluten we are entirely indebted for light bread. The flour of Indian corn, rice, potatoes, and many other vegetables, though they may be used for bread, can never be raised so as to make light bread. In the process of fermenting bread, carbonic acid is formed, which is retained only by the gluten, the starch permitting it to escape as fast as made.

The art of making bread, especially light bread, then depends upon diffusing the yeast through it equally; in other words, thorough kneading it. When that is done the carbonic acid is generated in nearly equal quantities through the whole mass, the gluten retaining it so as to render the bread uniformly light.

When the yeast is diffused unequally through the mass, some portions of the dough are raised before others, leaving parts of it unraised, or heavy, while other parts are carried so far as to become sour.

From the Pittsburg Advocate.

FACTORY GIRLS.

THERE is a great deal of mawkish sensibility in the newspapers, about factory girls having to work all day; but there is nothing said as to the girls who work in the kitchen, stooping for a long summer day over a wash-tub or a coal fire. These things most abound in the English newspapers; and in relation to that country, are doubtless correct. But the condition of our factory girls and those of the English factory, differs as greatly as the condition of the men employed at those factories in the respective countries. The strongest men can hardly make a bare subsistence in those factories, if the accounts from thence are to be relied upon; whilst, in this country, in many cases, factory girls make from \$3 to \$4 per week. In all cases they make a decent livelihood; and in all cases they prefer factory work to house work, or to being confined all day and part of the night to their needle. We sometimes see these English accounts about factory girls, copied into our American newspapers, without such explanations as should accompany them; and occasionally we are treated with a doleful ditty, something after the manner of "Poor John Woods," to work upon our feelings, and to show that a bell is a vastly uncivil article with which to admonish people that they ought to be at their work. The truth is, there is much misery in all monarchical countries. In England, especially, the poor are ground to the dust. Such is the case as well among farmers as manufacturers, and it extends itself through every department of life, in which individuals have to

earn their living by the work of their hands.—But this thing of exciting prejudice against manufacturing industry in the United States, because such industry is not rewarded in England, is, to say the least of it, *altogether wrong*. No freeman, deserving of the name, wishes to see labor so poorly rewarded in this country as it is in England; no one wishes to see the time at which the workman should not feel himself as independent as his employer, and as able to provide himself with a good joint of *meat* for his dinner and that of his family. No one wishes to see our workmen ground down to a state of half pauperism. Hence it is that the protective system was so warmly supported in Pittsburgh, and in every other large manufacturing community. If the time shall come, at which our manufacturers will be left without adequate protection against those of England, our factory girls and factory men too, will have bad times. Mournful ditties will then be applicable.

CURIOUS EFFECTS OF LIGHTNING.

WE learn from Waltham, that during a severe thunder storm, on the afternoon of the 8th inst. the Waltham Factory was struck with lightning. The fluid passed down the rod on the small factory until it reached the part of the roof to which the forcing pump is attached. It then separated, a portion of it passing through the roof upon the pump pipe, and making quite a hole. Another portion passing along the rod until it reached the dressing room window, where the copper pipe was resting almost upon the glass; it passed through the window, breaking ten panes of glass, and melting the end of the pipe; the remainder of the charge passed into the ground near the picker. There is a pipe which leads from the forcing pump at the bottom into the size-room, to convey water; and another that leads from the boiler in a wooden box under ground to convey steam. The pipe ends near the furnace. As the fluid passed down the pump pipe, it struck the boiler, and knocked off some of the bricks—passed along the steam pipe to the large mill—went up the furnace, and smoke pipe—passed along the hot air-pipe on the floor—ignited a number of pieces of cotton waste—blew off and split the cap on the top of the upright shaft, and passed down to the water wheel! Both mills were in operation at the time, but no person was in the least injured!

We think the circumstances above narrated, clearly prove the power and efficacy of lightning rods, provided they are judiciously treated. Had not the forcing pump been placed almost in contact with the conductor, all the electric fluid would undoubtedly have been conveyed to the ground without doing any injury. But the pump being of iron, also acted as a conductor, and performed its duty so faithfully, that it actually conveyed a portion of the fluid from the top to the bottom of the building, then under ground, a distance of 20 or 30 yards to another building, and the consequences from this circumstance had nearly proved serious.—*Lowell Journal*.

NEW CEMENT.

THE late conquest of Algiers by the French, has made known a new cement, used in the public works in that City. It is composed of two parts of ashes, three of clay and one of sand; this composition, called by the Moors *Fabbi*, being again mixed with oil, resists the inclemencies of the weather better than marble itself.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 31, 1833.

FARMERS' WORK FOR AUGUST.

Potato Tops for Fodder. It is said that a very good kind of fodder may be made of potato tops, by spreading and drying them on grass ground in the vicinity of a potato-field. We are told that in the southern states they reap about two thirds of the length of the potato tops, and dry them on mowing land in the usual way of hay-making. No damage is thus done to the potatoes, provided the tops are not gathered till the potatoes are ripe.

In some parts of the world potato tops are used to furnish food for man as well as beast. An article in Loudon's Magazine, vol. i. p. 447, states that "The tender tops and leaves of the potato, boiled and dressed as spinach, or boiled with salted meat, are very palatable, while the plants are not injured much by being deprived of them." We apprehend, however, that cutting off the tops of potatoes, before the roots or tubers have obtained their full growth and ripeness or nearly so, will be more injurious than some may be aware of. It has been maintained by some agriculturists that the tops of carrots might be cut off, as soon as the lower leaves begin to wither, without injury to the root. But the Mass. Agr. Journal, vol. iii. No. 3, p. 181-2, gives the details of certain experiments made by the Hon. JOSIAH QUINCY, in which a certain number of beds of carrots were cut, and the same number of similar beds were left *uncut*, and the advantage was in favor of the latter about as 8 to 5. From the results of these experiments, Mr. Quincy concluded that the carrot forms no exception to the usual analogy of nature in the growth of vegetables, "which depends nearly as much on the leaves as the roots."

From these premises we should conclude that it would not be good economy, as a general rule, to make use of potato tops for food for man or beast, till the tubers were ripe. But where early potatoes are gathered for market or domestic use, it might be well to make some experiments with their dried tops, to test their value as cattle-food.

Stubble. Where the stubble is large and the grain is cut with the sickle instead of the cradle, the ground will be benefitted by ploughing it under immediately after harvest. But if the stubble be permitted to stand till it is quite dried, and the juices have evaporated, it will then do the ground but little good. By ploughing in the stubble soon after reaping, we may likewise prevent the ripening of the seeds of many weeds, with which stubble lands are frequently infested.

But in the Georgics of Virgil it is insisted that burning off the stubble is to be preferred to ploughing it under; being more beneficial to the succeeding crop, and having a greater effect in fertilizing the land. The late Judge Peters of Pennsylvania was also of this opinion. He observed, in substance, that if straw and other rubbish be spread over land, and then burned off, it will be of more service to the soil than if the same straw or rubbish were suffered to rot on the ground.

Dr. Deane observed, "With ploughs of the common construction the ploughing of stubble ground is disagreeable work; neither can it be well performed. The plough is so apt to choke up, that it is more than one man can do to keep it clear. Ploughs for this work should be much deeper built than common ones. And this work might be greatly facilitated, if a heavy roller were passed over the stubble to lay it flat to the ground before ploughing. When this is doing great care should be taken to pass the roller the same way that the plough is to go. By means of this the coulter will but seldom be clogged with the stubble. If the rolling be neglected,

a small roller annexed to the fore end of the plough beam in the place of a foot, or even a foot itself, will greatly help to clear the way for the coulter."

When stubble is on stiff and strong land, it has been thought best to mow, collect and carry it into the farm yard, where it will soon be converted into manure.

An English writer states, that "Mr. W. Curtis of Lynn, Norfolk, found very beneficial effects from burning the stubble of oats, which were left eighteen inches high for that purpose. On a field broken up from old pasture the same year, he afterwards sowed wheat and oats in succession on the same ground, the stubble of both which was burned in the same manner. The ashes were in every case ploughed in to a small depth, and the verges of the field mowed to prevent accidents. After the third crop of grain, all of which was abundant and remarkably free from weeds, the field was laid down with clover and grass seeds, and the ensuing crops both of hay and grass proved infinitely finer than those before the ground was broken up.

"Another piece of land was cropped for three successive years in the same manner as the first, to which it was similar in every respect of soil, aspect and previous arrangement, but in which the stubble was ploughed in, instead of being burned; the produce of each crop on it was much inferior to that of the first experiment, and the weeds increased so greatly, that in laying it down to grass, they quite overpowered the grass seeds, so much so that it was necessary to re-sow it; and ever after while Mr. Curtis held it, the grass and hay produced were coarse and full of weeds; and consequently inferior both in value and quantity to those of the other field, in which the stubble had been burned."

In burning stubble, the danger which is to be apprehended from the spreading of the flames may, perhaps, be obviated by tracing a furrow round the field, and setting fire to the stubble on the inner edge of the furrow.

Fine Rose. Mr. J. P. Bradlee, of Boston, informs us that he saw in the garden of Mr. Zenas Gardener, at Nantucket, a GREVILLE ROSE, which had 200 distinct clusters, with 30 flowers in a cluster. This superb flower is 6 years old; and it has been found that the plant will not come to maturity, nor exhibit its beauties under about 6 years from the time it first takes root. This circumstance has led some to condemn the plant, who were not aware of the time necessary for its growth and development. For notices of this elegant production, see N. E. Farmer, vol. viii, p. 9.

A gentleman called at the office of the N. E. Farmer, in the absence of the Editor, and left the following notices of a plant the properties of which it is wished might be further investigated and described:

Genista, Yellow Flower, called Woodwack. Grows abundantly in the Eastern part of Lynn, Mass. Said to be used in France in the manufacture of fine writing paper, as a substitute for linen rags. As it is now in full bloom, it might be well for some of our paper makers, in that vicinity to make experiments for the purpose of ascertaining its value. Mr. Prince of Long Island has this article for sale at 6 shillings per root.

Remedy against the Cankerworm. A gentleman informs us that in Plymouth, Mass. they make use of the following mixture as a substitute for tar, in preserving fruit trees against Cankerworms, viz: White Varnish, Soft Soap and Whale Oil, one third of each, to be mixed and applied at the times and manner of the usual application of tar for the same purpose. The advantages of the mixture, we understand, are that it is not so soon hardened by the weather, and of course need not be so often applied, and does not in the least injure the trees to which the application is made.

ITEMS OF INTELLIGENCE.

Wheat. There will be more wheat harvested in this town and other towns in the vicinity the present season, than in any year during the last 20 or 30 years. Yet the quantity would seem very small to a western farmer. There may be 100 or 125 acres of wheat in Northampton meadow, but this is less than some individuals raise in the western states. The wheat stalks in the meadow have quite a rusty appearance, and it is not improbable that the grain is some injured. The wheat on uplands in South Hadley and other towns is more free from rust.—*Northamp. Gaz.*

Gimblets. The yankees are in a fair way to destroy John Bull's gimblet trade with this country. The new twist gimblet is almost as much superior to the old English gimblet, as the screw auger is to the old pod auger. There is a gimblet factory at West Whately, which employs 15 hands, about half of them females, and manufactures 25 gross per week. The steel is imported from England in round rods; the handles are turned out in the vicinity. There is a gimblet factory in Buckland, one in the northern part of Franklin county, one in Keene, N. H. and one or more in Connecticut.—*Northampton Gaz.*

Results of the Temperance Reformation. The average number of paupers in the Lynn Poor House, for several years previous to the temperance reform, amounted to between seventy and eighty. Now the whole number supported on the farm, is *twenty-seven* only. This diminution of pauperism is attributed entirely to the diminished use of ardent spirits.—*Salem Gaz.*

Temperance. Extract of a letter, dated Albany, July 15, 1833—published in the New York American.

"I have just returned from a tour through Vermont and New-Hampshire—led by curiosity to go thoroughly through the country, in order that I might judge from personal observation of the effects of Temperance efforts. In the two states thus visited, the results are truly astonishing.

"The Farmers, almost to a man, have discharged the unclean thing. Imagine to yourself the change. Fields burdened with nature's bounties, no longer yield their wholesome products a sacrifice to the hellish still, belching forth again in that worst of poisons—killing body and soul—but are now made to yield comfort, affluence, education. The Academy has displaced the distillery. Rum no longer degrades the son of the farmer below the beast he rides, nor prepares a drunken husband for the farmer's innocent daughter. It is doing well."

Italian Fig Tree. Among the time-worn ruins of the ancient castle of Reculver, in the island of Thanet, which forms part of the county of Kent, an ancient fig-tree stretches forth its venerable arms to the breeze, and attracts the attention of the visiter, not more by the venerable aspect it presents, than by the historical records with which it is connected. This tree, according to the traditions of the neighborhood, claims Italy for the soil of its nativity, and Roman hands for those of its first planters; its age consequently cannot be less than from 1345 to 1888 years, the Romans having first landed at Deal in the summer of the 55th year before the birth of our Saviour, 1888 years ago; and having finally quitted Britain in the year of our Lord 448, or 1345 years ago.

Extraordinary Fecundity. An ewe, of the Down and Leicester breed, belonging to Mr. Walker of Islip, in this county, brought forth two fine lambs, and on the Friday morning following, the shepherd was surprised at finding two more lambs by the side of the same mother, all four likely to do well.—*Oxford (Eng.) Herald.*

An ewe, the property of Mr. Milliner, near Newport, Monmouthshire, yeanned 4 lambs, all of which are doing well.—*Sherborne (Eng.) Jour.*

"Split me! don't blow me!"—or a new mode of blasting rocks with a screw, which we copy from the Pennsylvania:

In the last number of the Mechanic's Magazine, published in New-York, we observe an extract from a London periodical of the same name, describing a newly invented stone-splitting screw, calculated to obviate the necessity of blasting, which is worthy the attention of practical men. The writer illustrates his position by diagrams. He mentions that two men, with a lever of only three feet in length, and a single screw and segments, split a mass of argillaceous limestone of the county of Dublin, weighing nearly a ton, in seventeen revolutions of the screw, made in 25 or 30 seconds. The men did not put forth their strength, but merely walked round the stone, which was split contrary to its stratification, and exactly in the line of separation of the segments. The instrument is applicable to slate quarrying, and to obtaining great tabular masses of granite, sienite, or other hard and homogenous rocks—the advantages are the saving of labor, the certain direction of the fracture, and capability of obtaining larger blocks than can be done by wedging. It may be applied to raising stratified rocks from their beds, and as a substitute for blasting in general—it is also free from all danger to workmen. A full description may be seen in the May number of the Mechanic's Magazine.

On the 14th inst. between 4 and five o'clock P. M. the dwelling house of Mr. Peter Hannaford, jun. New Hampton, N. H. was struck by lightning, and Mr. Hannaford, his wife, and Mr. G. W. Hobbs, were instantly killed.

The corner stone of the Girard College was laid at Philadelphia, on the 4th, and an address delivered on the occasion, by Nicholas Biddle, Esq. President of the United States Bank.

Clough, the murderer of Mrs. Hamilton, was executed on Friday last at Mount Holly, N. Jersey, according to his sentence.

Manual Labor School. Exertions are making by a number of gentlemen to establish in this vicinity a Manual Labor School. An act of incorporation was procured during the last session of the Legislature, and several enterprising and intelligent individuals are bestowing their attention on the subject.—*Hartford Times.*

BOSTON FANEUIL MARKET, July 31, 1833.

Vegetables. Early Potatoes, 60 to 75 cts per bushel; Peas, 75 cts pr bus; String Beans, 75 cts. per bush.; Squashes, 12½ cts pr doz; Cucumbers, 12½ pr doz; Turnips, Onions, Beets and Carrots, 6½ cts pr bunch; Green Corn, 12½ cts pr doz; Shell Beans, 12½ cts pr qt; Tomatoes, 20 cts per doz.

Fruit. Pears, \$2 per bushel; Apples, from \$1.50 to \$2, according to quality; Whortleberries, 8 cts pr qt; Blackberries, 1s pr box; Gooseberries, 1s pr qt; Peaches, 2s 3d per doz; Apricots, 3s pr doz.

REAL ESTATE FOR SALE.

THE subscriber offers for sale his valuable Real Estate in the town of Palmelia, on the Black River, opposite the village of Watertown, in the county of Jefferson, state of New-York, consisting of a Saw Mill, Flouring Mill, with four run of Burr Stones in good order, Machine Shop and Distillery, and is one of the best hydraulic privileges in the State.

Also, six small Dwelling Houses, with suitable out-houses. Also, one large two story DWELLING HOUSE, with a barn and all other out-houses attached to it that are necessary, with a garden extending to the banks of the river.

Also, about three hundred acres of first rate Land, lying over one mile on the river and road leading from Watertown to Brownville; about one half is under cultivation, and the remainder is good wood land.

The above property will be sold at auction on the first day of October next, (unless sooner sold at private sale), in such parts as may suit purchasers. Two-thirds of the purchase money may remain two or three years on bonds and mortgages. Those who wish to make good bargains would do well to call and examine the premises. Any information that may be wanted can be had by applying to the subscriber at Watertown.

J. FOSTER.

July 24

COUNTRY SEAT FOR SALE AT AUCTION.

WILL be sold at auction on Monday the 2d day of Sept. next at 4 o'clock P. M. (if not sold previous at private sale), the House, Barn and out Buildings, with about one and a half acres of land attached to the same laid out as a garden well stocked with every description of the choicest kind of fruit trees, all of which are in bearing. The House is two stories high, well furnished, with four rooms on the lower floor besides the kitchen. 9 good chambers, 2 wells of water, good cistern for rain water, the Barn is large and in perfect repair.

This situation is in Dorchester on the road leading from Roxbury to South Boston, three miles from State street, in the immediate neighborhood of the late Gov. Eustis' estate, and adjoining that elegant situation formerly owned by Cornelius Coolidge, Esq. and now owned by Charles Taylor, Esq.—the sale will be on the premises, where the conditions will be made known; the place can be examined any day previous to the sale from 3 to 7 P. M. for further information inquire of Jno. Swett on the premises or at No. 52 India Wharf. epts jy31

BROOKS' PATENT SILK SPINNER.

THE public attention is invited to this machine. It is adapted to domestic use, is simple in its construction, occupies a small space, and may be used to advantage by women and children. This machine may be obtained by applying to T. R. NEWELL, at the Agricultural Warehouse, No. 52 North Market street, Boston; or to the Patentee, ADAM BROOKS, at West Scituate, Mass.

SCITUATE, July 22, 1833.

I have seen Brooks' patent Silk Spinner in operation, and I am of opinion that it is an invention of great value and importance. It performs three operations at the same time. 1. Reeling from the cocoons; and in this operation it has an obvious advantage over the Piedmontese Reel, in the arranging of the guide wires so as to avoid tangling and breaking the filaments of silk.—II. Spinning or twisting the silk. This being done immediately, as it is drawn from the cocoons, while properly moistened, and its natural glue softened, the silk runs into a perfectly even thread. The size of the thread is regulated, of course, by the number of filaments drawn from the cocoons. III. Doubling and twisting. This also being performed at once, and before the glue of the silk has hardened, a sewing silk is produced of more perfect evenness and strength than has perhaps ever been manufactured in any other manner.

This machine is adapted to domestic use. A woman and a child can manufacture a thousand cocoons into sewing silk in a day, and more than that number, if it be only spun into warp or filling. It is a simple machine, and not likely to embarrass the spinner by getting out of order or needing repair. It occupies about as much space as the well known domestic foot or linen wheel; but at the same time it is capable of being multiplied like cotton spindles and moved by steam, horse or water power, to any extent that may ever be demanded.

REV. SAMUEL DEANE.

We the undersigned, having seen Brooks' patent Silk Spinner in operation, do hereby express our concurrence with the opinion expressed above.

NATHL. CLAPP.

SAMUEL A. TURNER,

JAMES CURTIS,

Agent of Pembroke Cotton Factory, CALVIN SHEPHERD,

JAMES O. CURTIS,

JNO. COLLAMORE,

DAVID PROUTY.

BROOKS' PATENT SILK MACHINE.

Will be exhibited at the room over the Agricultural Warehouse, No. 51 North Market street, in full operation, spinning silk from off the cocoons into a perfect sewing silk. At the same time there will be an exhibition of various articles of domestic manufactures of silk; also of Silk Worms in their several stages, from the egg to the miller, and in the various processes of manufacture of the cocoons. Exhibition to be opened on THURSDAY next, first day of August, and will continue three days. Admittance 25 cents—children half price. jy31

FOR SALE,

AT the Agricultural Warehouse, 50½ North Market Street, Harris' Patent PAINT MILLS, being a great improvement on the common Paint Mills now in use, and are calculated for grinding all kinds of paints—as they are easily cleaned, and no way liable to get out of order.

Howard's Improved expanding CULTIVATOR. The Cultivator is well adapted to free and easy drill cultivation, and much approved for various purposes—as it works very easy, and leaves the ground light and free, for hoeing, and for cultivating corn, potatoes, &c.

Howard's Double Mould Hand PLOUGH. This plough is calculated for furrowing out lands, splitting hills, ploughing between corn, potatoes and vegetable cultivation, to great advantage, and is a great labor saving machine.

Davis' Patent Road and Dirt SHOVEL. This Shovel is made much in the common form, but much improved by being shod with Iron something in the shape of a Ploughshare, and on an entire new plan. jy24

BRIGHTON MARKET.—MONDAY, JULY 29, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day 543 Beef Cattle, (including about 100 unsold last week,) 10 Cows and Calves, and 2200 Sheep and Lambs, and 100 Swine; about 120 Beef Cattle remain unsold.

PRICES. Beef Cattle.—A falling off of about 25c. the hundred from last week. We noticed a yoke or two taken at \$5.75. We quote prime at \$5.25 a 5.50; good at \$4.75 a 5; thin at \$3.75 a 4.50.

Cows and Calves. We noticed sales at \$12, 15, 19, 24, 27. Sheep and Lambs.—In good demand, many of them being ordinary prices are consequently low. We noticed lots taken at \$1.33, 1.50, 1.62, 1.75, 2, 2.25, 2.33, 2.50, and \$2.67.

Swine.—A few were retailed without weighing: no sales by weight.

NEW ENGLAND FARMER COMPLETE.

FOR sale at the New England Farmer Office a complete set and the last of the N. E. Farmer in 11 volumes bound, the whole containing 4570 pages, with a copious index to each vol. Price 3.75 per vol.

MISCELLANY.

For the New England Farmer.

LOVE AND MAGNANIMITY.

I'm in love with a lady, who is fairer than May-day,
But December storms are not colder—
Am ruin'd forever unless I can have her,
And so have I forty times told her.

She declines, I'm declining, none pities my pining,
Though grown so amazingly small, Sir,
That I am at most, but the shade of a ghost,
Quintessence of nothing at all, Sir!

Yet the flint-hearted Fair says she should not care,
If I were as dead as smoked herring;
With a heart like a feather she would go any weather,
And dance all the way to my burying.

Well, since I can't please her no longer I'll tease her,
But look out for some other pretty one,
Who, if not quite so killing, is a little more willing
To condescend kindly to pity one.

KNOWLEDGE OF LAW FOR FAMILIES.

LEGAL RELATION OF MAN AND WIFE.

THE effects produced by marriage on the legal rights of the parties are important to be known in every family.

In law, husband and wife are considered as one person; and on this principle, all their civil duties, rights and disabilities rest.

The wife cannot sue in her own name.

If she suffers injury, or wrong, in her person or property, she can with her husband's aid and concurrence prosecute for redress; but the husband must always be the plaintiff. In criminal cases, however, their relations assume a new form; the wife may in criminal cases, be prosecuted and punished.

The wife can make no contract with the husband, nor the husband with the wife; this disability is involved in the first principle which makes them legally one. But they may contract through the agency of trustees, the wife being under protection of the husband.

All contracts made between them before marriage, are dissolved upon that event.

The husband cannot convey lands or rent estates to his wife directly, but he may settle them upon her through a trusteeship. The wife may release her dower for his grantee. As it respects the right of bequest, the husband can always devise real estate to his wife.

Upon marriage, the husband becomes possessed of all right and title to her property, whether personal or real; and at the same time he becomes liable for all debts, and must fulfil all her contracts made prior to their union.

If the wife die before the husband, and there be no issue, his heirs succeed to her real estate.

But in case of issue, the husband remains in possession of her lands during his life time only—and at his demise they go to the heirs of his wife.

All debts due to the wife become after marriage the property of the husband, who becomes invested with the power to sue on bond, note or any other obligation, to his own and exclusive use.—The powers of discharge and assignment, and change of securities, are involved in the leading principle.

If he dies before the recovery of the money, or the change of sureties, the wife becomes entitled to the debts in her own right.

All personal property of the wife, such as money, goods moveable, and stocks, become absolute-

ly the property of the husband upon marriage, and on his death to his heirs.

Property may be secured to the wife, by deeds or marriage settlement, in order to secure to the wife a comfortable competence against the vicissitudes of life, or the extravagance, vices, or cruelty of her husband.

Property may be settled on the wife, after marriage, by the husband, provided he be solvent at the time, and not made with a view to defraud creditors.

The wife cannot demise lands; but any personal or real estate settled upon her, in trust, she may bequeath; or any savings from the property given to her separate use.

The husband is bound to provide his wife with all necessaries suited to her condition in life; and becomes liable for debts contracted by her for such necessaries, but not for superfluities or extravagances.

The husband and wife cannot be witnesses against each other, in civil or criminal cases, where the testimony has the least tendency to favor or criminate each other.

One exception to this rule exists, where the law respecting the personal safety and life of the wife, permit her to give testimony against her husband for her own protection.

INSTINCT OF WILD DUCKS.

BEING engaged in improving the grounds at Hedgerley Park, Buckinghamshire, during the last winter, I was desirous that the laborers should be kept employed in frosty weather, and therefore took the opportunity of collecting a quantity of large roots and stumps of trees which had been grubbed up at various times in the woods and hedgerows; these were dragged over the ice to an island in the centre of the lake, for the purpose of forming picturesque towers and ruins. During this process I was much amused by the movements of a great number of wild ducks on the opposite side of the lake; where about fifteen or twenty of these aquatic birds were constantly swimming, diving, and violently agitating the water, so as to prevent its becoming congealed by the frost: this they effectually prevented although the ice on the other parts of the lake was sufficiently strong to bear not only the weight of the large stumps of trees, but also that of ten or twelve men, whose labors were necessary to drag them to the island. When these ducks became weary and retired from the water, they were regularly relieved by about the same number of others, which had been nestling amongst the rushes, on the bank; and these again after a certain time, relinquished their labors to another party, so that the water was kept in a constant state of agitation both night and day, until the frost was over.—I observed, that whenever the fresh party of ducks entered the water, their first object was to swim close to the ice in a semicircular form, so as to entirely prevent it congealing any where within their boundaries; but what struck me as the most extraordinary circumstance was that when the well known whistle of the keeper proclaimed the feeding-time, it had no effect on the ducks then on duty, although the others flew as usual to the spot with their accustomed clamor; a part, however, soon returned to the lake with a loud call for those then in the water to change situations, which was performed with an alacrity and regularity, that would have been a lesson to well disciplined troops. The ducks appeared nearly

regardless of the laborers, although at other times a single footstep would have alarmed the whole flock, and put them to flight.—*Mr. Henry Phillips in a Letter in the Hort. Reg. No. 16.*

WHOLESALE AND RETAIL CASH STORE.

ELIAB STONE BREWER, No. 414, Washington Street, (South end) has received a general assortment of *Spring and Summer Goods*, among which are 100 cases English, French and American Prints of all prices and qualities—20 cases Petticoat Robes—1 case Cambric Muslins, some of which are very fine—1 case Cotton Cambrics do. do.—1 case White Lilesia for lining ladies dresses—1 case Book Binders' Cambric for do. do.—3 cases do.—100 cases bleached and brown Sheet and Shirting, some extra fine—1 case Marseilles Quilts, from 8 to 10 quarters—5 cases London Rose Blankets, some of a very superior quality and large size—1 case Hearth Rugs—4 cases Chapp's spool 6 cord cotton, warranted—200 yards superior quality—5 cases Clark's do. at very low prices by doz. or case—2000 fancy boxes—a large variety of colored and black French Silks at very reduced prices—2 cases col'd Batiste—1 case black and colored Barage—4 cases French and London printed Muslins of new patterns and beautiful colors—2 cases three cord superfine Italianettes, black and fashionable colors—1 case common do.—1 case Plaid Palmgrim's super quality—1 case Pou de Soi a genteel article for ladies' summer dresses, 9d per yd—20 ps super mix'd, drab, and olive Merino Cassinets for children's summer dresses—20 ps Rouen Cassimere with a large variety of superfine and fine Broadcloths and Cassimeres—20 bales Pelisse Wadding—3 cases superior Ticking—4 cases cheap do.—10 cases improved soft finished 4-4 Irish Linen, manufactured for the London market and imported expressly for the subscriber.

The above goods are offered for cash only at prices so extremely low as will make it an object for purchasers either by piece or yard to call and see. May 29

PEMBROKE BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butter Salt. 6600 loaves Table Salt.

Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale. June 5 CHAS. I. CAZENOVE & CO.

TO SUBSCRIBERS.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half-bound and lettered, at 75 cents per volume, by leaving them at the Farmer Office. July 17

FARMER'S OWN BOOK.

For sale at the New England Farmer office the *Farmer's Own Book* or Family Receipts. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 50 cents.

Also, the *FRUGAL HOUSEWIFE*, by Mrs. Child, dedicated to those who are not ashamed of economy,—a work which should be in every family. Price 50 cents.

GENTLEMAN'S POCKET FARRIER.

COMMUNICATIONS.

For the New England Farmer.

CULTURE OF WHEAT.

MR. EDITOR, I read always with great respect the communications in your paper signed "B." recognizing under that signature the pen of one of the most intelligent and instructive farmers in the United States. With these feelings I took up his late remarks in your No. 1 of the present volume, on the failure of the wheat crops in New England. The subject is of the highest importance, and as he can have no object but the truth in the case, the ascertainment of the real causes,—and as in controverting the theory of President Dwight, he has only substituted another, he will deem facts which bear upon the question highly valuable, since it is only by facts, accurately observed, that the matter can be decided.

Wheat is subject to several diseases, and many enemies in the insect tribe; but it is its failure by what is called blasting, mildew, or rust, to which we shall more particularly refer. When the crop is fast approaching maturity the stalk and leaves suddenly assume a brown appearance like the rust of iron, which extends pretty rapidly through the whole field; the ears do not fill, or the grain becomes shrivelled; and a very small crop or an entire loss of crop is the consequence. The frequent occurrence of this disease has been the reason why the cultivation of wheat on the meadow grounds of the Connecticut river has been for several years almost wholly abandoned.

President Dwight describes what physicians call the prognostics of the disease very accurately. "Plethora is induced in the plant, or an excess of sap in the culm or stock, which not finding a ready passage in warm and damp weather, ruptures the sap vessels, flows out upon the surface, becomes acrid, corrodes the straw, induces rust, and finally blasts the grain." He ascribes it to the deleterious influence of animal manure, or stable and yard dung.

The President of the Agricultural Society in New York ascribes the disease to a want of the specific food of the plant in the soil, which is nitrogen—a substance in which the New England lands, which are of primitive formation, are deficient, which plants are incapable of obtaining from the atmosphere, but which he thinks may be furnished by the application of lime, ashes, fish, bones, horns, slaughter-house manure, and the urine of animals. Now what are the facts in the case. Four years ago I raised a fine crop of spring wheat (the seed called the Tea wheat, obtained at the Agricultural Store, Boston,) at the rate of twenty-five bushels to the acre on my farm at Lynn, a primitive formation, and in the midst of hills of granite. This was in a gravelly soil, and the land highly manured with soap boiler's waste and leached ashes, in which a considerable quantity of lime was intermixed. The succeeding year I was as successful in a similar soil on a side of a hill, the land having been manured the previous year for turnips with common stable manure. Both these crops were entirely free from disease, and what is not a little remarkable grew in the immediate neighborhood, within five or ten rods

of large quantities of barberry bushes, with which that part of the country abounds.

The last spring I sowed the same wheat in a piece of rich alluvial land in the Deerfield meadows, near the juncture of that river with the Connecticut, which had been the year before in hemp. I manured for the wheat with common barn yard manure, and upon three quarters of an acre obtained thirteen bushels of a very fine sample, and the crop perfectly free from disease or blight, though the kernel was rather small. This was the spring wheat, of which I have now standing upon two acres a promising crop.

The year before the last Col. Wilson, living in Deerfield on the banks of the Connecticut, raised a fine crop of winter wheat on land which two years before had been manured for Indian corn and the year preceding very liberally for hemp, of which a good crop was gathered, but the year on which the wheat was sowed the land received no manure. His crop was healthy, and amounted to 24 bushels an acre, for which the Massachusetts Agricultural Society conferred upon him a premium.

The last year large crops of fine wheat were raised in this vicinity in the neighborhood of the rivers, and some very fine crops on land which had been the year preceding manured for hemp, and on which a crop of hemp had been raised. Very good crops likewise were obtained in various places, above and below this place on the alluvial lands of the Connecticut, making flour equal to any received under the best Genesee brands.

Emboldened by this success much wheat is growing the present year on the meadows of the Connecticut and Deerfield rivers; one individual having twenty-three acres in one lot, which promised finely and which he expected to reap ten days since; but the result of which I have not heard. I myself sowed three acres of winter wheat on some of the best land in the Deerfield meadows. The land was green sward, turned up last fall, rolled and harrowed, and the seed soaked in strong brine and then limed, and sowed at the rate of two and one half bushels to an acre on the 27th October last. One half the lot was abundantly manured, and to the other no manure was applied. The seed came up finely, and nothing could exceed the beauty and luxuriance of the growth, a greater part of the field averaging more than five feet in height. I know that the fish we lose from the hook just at the surface of the water are always the largest, but many respectable and experienced farmers pronounced it as fine a growth as they had ever seen; and before and since it was cut gave it as their opinion that if it had filled well it might have been expected to yield from forty to sixty bushels to the acre.

Above half of the field, including an equal portion of the manured and that not manured, was passed over twice in the spring after the grain had got to be six inches in height with a light barrow drawn by one yoke of oxen; and three weeks after was subjected to the same process, according to the method practised in France, as mentioned by the late President of the N. Y. Agr. Society in his second communication to that body. The effect of this was to destroy very few of the plants, and

to render the growth of what remained much more luxuriant, producing such an increase of the stem and such an extension of the heads as to attract the notice of the most casual observer, and to induce several persons, who were ignorant of the process to which it had been subjected, to inquire for the cause of the difference in the two parts of the field, and to ask if a different kind of seed had been used.

After all, however, to my extreme disappointment, the whole field has been blasted, and I shall hardly get back to the amount of seed sown, and that in a small shrivelled grain. The crop is housed but will scarcely pay the expense of threshing.

Now that this result was not owing to the use of stable dung is obvious, because none was used; and that part of the field where the blight appeared to commence and to make most rapid progress, no manure whatever was used.

It was not owing to the want of the specific property in the soil as far as that is to be found in lime and slaughter-house manure, for both of these were employed; the seed was limed, and the above manure copiously applied.

It is not to be attributed to the luxuriance of the crop, for several pieces, as I learn in my neighborhood, have suffered equally, and from the same cause, when the cultivation was by no means so high.

It is not a time of universal failure, for a good deal in this vicinity is perfectly healthy and sound, and I have already reaped on the same farm a small piece of wheat, say half an acre, on higher land, which was healthy and fair, though from the condition of the land it gave a small product. This, however, though sowed at the same time, was ready for the sickle more than a week sooner than the other, from the drier and poorer character of the soil.

What then was the cause of the blast? I will not assume to decide this question, but as far as appears it was atmospheric, occurring at a particular state of the plant, which rendered it peculiarly liable to blight. As the wheat was filling fast, we had frequent showers, and much of what we Yankees call *muggy* weather; one day in particular the air was sultry, the heat intense, and the showers frequent with intervals of sunshine, and the earth was steaming most profusely. An intelligent farmer in my employ, accustomed to the cultivation of this grain in one of the best wheat districts in New York, remarked to me that this was severe weather for my wheat and that he feared should lose it. The rust in fact appeared for the first time the next day and rapidly extended itself over the whole field, presenting no difference either in the manured or in the parts of the field not manured, and of course less luxuriant. Had my wheat been sown earlier, so as to have been farthendvanced, it would probably have escaped the blight; had it been sown later, so as not to have been so far advanced as it was, perhaps I should have been as fortunate; but the occurrence of such a peculiar state of the atmosphere being wholly accidental, at least as far as we are concerned it is impossible to make any certain calculations respect to it.

I am unable then to give any other explanation of the failure of my wheat crop, than that a most unfavorable state of the weather occurred precisely at the time, when the crop was most susceptible of injury. This after all may not be the true account of it; and as we must rely upon facts much more than upon any opinions, I will endeavor to collect from several of my neighbors, who have cultivated wheat the present year, whether with or without success, the true history of their crops; and if the facts appear valuable will forward them to you for publication. I wish other farmers, favorably situated, would do the same, and thus confer on the agricultural public a substantial benefit.

I know how much more agreeable it is to communicate an account of our successes than of our disappointments; and most certainly it would for various reasons have been never more gratifying to have informed you of my good rather than of my ill fortune; but such disappointments are far from being unmixed evil; and it will be no small compensation to me if at any time by exposing the circumstance of my own ill success, I can save others from a similar loss and disappointment.

Meadowbanks, July 25, 1833.

For the New England Farmer.

INFLUENCE OF THE MOON.

MR. FESSENDEN, Some weeks ago I saw a piece in your paper, copied I think from the *Genesee Farmer*, apparently to ridicule those who have any respect to the influence of the moon on vegetables.

If all are to be called ridiculous who believe in Facts, how are we to expect improvements? I do not call myself a Farmer, but I have bought and sold many pieces of land, and have needed only a little to improve, yet I have not lived more than 80 years without making some observations. I am one of those who believe in the influence of the moon on the productions of the earth.

Alders, in some low lands grow in great plenty, and have been cut up repeatedly, in such pastures, without lessening or destroying them. Let them be cut at a certain time of the moon, in August, and they will not sprout again, but die, and the stubs will soon rot. The time this year is the 14th and 15th days. Let the incredulous try it.

Ridiculous as this may seem, I could prove my assertion by a relation of facts, and how it happened that I fixed on that time, would not the relation be too prolix and tedious.

Chestnut and black ash timber, cut 'or rails at the last quarter of the moon, especially in February and March, is, (I believe from experience) of four times the value for fence to that cut at the first quarter. I do not say in but at. The same probably might be said of timbers cut for building and other purposes.

Chestnut, cut down at the last quarter of the moon is tolerable fuel when dried, but if cut at the first quarter, the snapping is very troublesome in an open fire place. Cut hemlock at said times, split it fine and dry it, and there is as much difference in their burning as there is between a squirrel hunt and an Indian battle. Yours, &c.

Berkshire, July 1833.

O. P.

P. S. The reason I give for alder-bushes dying when cut at said time, is that the sap flows so plentifully as completely to exhaust the roots, and they soon dry, absorb moisture and rot fast.

O. P.

By the Editor. We have ever been somewhat inclined to incredulity on the subject of the influ-

ence of the moon in vegetation. We have believed that the agency of that planet is confined to the tides of the ocean and of the atmosphere. But philosophers of ancient times gave the moon much credit for her interference in *sublunary* concerns. "The ancients had a great regard to the age of the moon in the felling of their timber. Their rules were to fell in the wane, or within four days after the new moon. Some let it be the last quarter. Pliny orders it to be in the very article of the change, which happening on the last day of the winter solstice [shortest day in the winter] the timber, he says, will be immortal: Columella says, from the 20th to the 28th day: Cato, four days after the full: Vegetius, from the 15th to the 25th, for ship timber; but never in the increase, trees then most abounding with moisture, the only source of putrefaction."*

An old book on Agriculture by the Rev. Dr. JARED ELLIOT, much esteemed by our ancestors, contains the following remarks on this subject.

"In my fourth essay, I informed the reader I was in hopes, that I had found certain times for cutting bushes, which would be more effectual for their destruction than any yet discovered; that if I found it so I would give notice of it in my next: I am glad I am able to perform that promise: the times are in the months of June, July and August, in the old of the moon that day the sign is in the heart. It will not always happen every month: it happened so but once this year, and that proves to be on Sunday. Last year in June or July, I forget which, I sent a man to make trial: in going to the place, some of the neighbors understanding by him the business he was going about, and the reason of his going at that point of time, they also went to their land, and cut bushes also on that day; theirs were tall bushes that had never been cut; mine were short bushes, such as had often been cut to no purpose, without it was to increase their number. The consequence was, that in every place it killed so universally that there is not left alive scarcely one in a hundred. The trial was made in three or four places on that same day.—In July or August on the critical day, another swamp was cut, the brush was the greater part of it swamp button wood, the most difficult to subdue of any wood I know; I have been lately to see it, and find the destruction of these bushes is not so universal as among alders and other sorts of growth. * * *

"The reason why there was not the same success attending the cutting these button bushes as the other sorts, I suppose to be from the stubborn nature of this kind, which would yield to no cutting; the ordinary way has been to dig or plough it up by the roots, so that considering the nature of the bush I have had great success: the ground being very boggy, those who mowed them were obliged to cut them very high, which was another disadvantage.

"To show such a regard to the signs may incur the imputation of ignorance or superstition, for the learned know well enough, that the division of the zodiac into twelve signs, and the appropriating these to the several parts of the human body, is not the work of nature but of art, contrived by astronomers for convenience. It is also well known that the moon's attraction hath great influence on all sorts of fluids.

"It is also well known to farmers, that there

are times when bushes if cut will universally die. A regard to the sign, as it serveth to point out and direct the proper time, so it becomes worthy of observation.

"If farmers attend to the time with care, and employ hands on those days, they will find their account in it. This rule attended to may save the country many thousand days' work. A farmer of good credit told me, that he had found by experience that bushes cut with a sharp tool, would die more than when cut with a dull one. This looks agreeable to reason, for the sharp scythe leaves the mouths of the sap vessels all open, by which means they bleed more plentifully; the dull instrument bruises the part, and in a degree doth close up the wound."

Some modern scientific and practical men have likewise expressed opinions in favor of attending to the state of the moon in cutting timber. *The Farmer's Assistant*, page 382, says, "We are assured from an experienced builder of some of the first rate bridges in the northern part of this country, that such timber as is to be exposed to the water, or to frequent wetness, should be felled during the increase of the moon; and such as is to be kept dry, should be felled during the decrease of that planet."

Dr. Deane, Col. Pickering, and most other scientific agriculturists of modern times have denied that the moon has any agency in matters relating to agriculture or rural economy. We have been somewhat inclining towards the *anti-lunar* party, and have thought that that planet never intermeddled with a farmer's concerns. Still it is improper that any preconceived theories or great authorities should induce us to overlook, or disregard, *matters of fact*. If we should refuse to believe all that we cannot comprehend, we must deny the power of magnetism, electricity, gravitation, in which wonderful effects are indicated, but their causes bid defiance our limited powers of investigation.

For the New England Farmer.

SUCCESSFUL CULTURE OF WHEAT.

NORTHAMPTON, July 25, 1833.

MR. FESSENDEN, I have noticed several articles recently in the *Farmer*, assigning reasons for the failure of the wheat crop on old land like "Northampton flats." So far as my observation has extended, the only cause of failure has been our farmers are not in the habit of sowing it. I ventured, last fall, to sow two acres of wheat and one of rye. The crop of wheat will be about double the number of bushels to the acre as that of the rye. About one third of my seed was the white flint—the remainder the common bearded wheat. In May last our meadows were flowed. A flood has always been considered sure to blast English grain. After the flood had receded from the meadows all kinds of grain of this description grew finely and the straw looked very bright until about the 10th July, when there suddenly appeared a rust upon it. The white flint or bald wheat being about ten days later than the bearded wheat was blasted badly, while the latter is generally good. These remarks apply to lands that were not flowed as well as to those that were. We get from our "flats" from 20 to 40 bushels of corn as an average crop. I took from 57 rods 14 shocks of wheat that will yield over a bushel to a shock—I think I put it low at 35 bushels to the acre. The land had been used for corn several years with about eight loads of manure put in the hole. The

wheat was sown after I took off the corn in the fall without any dressing of manure. The remainder of my wheat land I gave a light dressing of leached ashes, chip dung, &c. I have noticed several pieces of Spring Wheat where the grain appeared promising, particularly one piece of Tea wheat raised by Mr. Samuel Whitmarsh. Where wheat has been sown on our meadows for the last five or six years it has given the farmer more profit than any crop he could have put on.

Yours, Respectfully, HIRAM FERRY.

For the New England Farmer.
WINTER RYE.

Haverhill, July 23, 1833.

MR. FESSENDEN, I noticed in the New England Farmer for July 17th, an article copied from the "*Transactions of the Essex Agricultural Society*" for the year 1832, upon the Cultivation of winter Rye. Among a few unimportant errors I observed one which perhaps it may be as well to correct. It occurs in the middle column. "Owing to the extent of our tillage land we have not been able to apply more than four or five loads of manure per acre this season." It should have been "each season," that is, each of the "three or four previous, &c." As it appears in the Farmer and also in the "*Transactions, &c.*" one would suppose that four or five loads of manure per acre had been applied when the rye was sown. Had this been the case, the greatness of the crop might have been attributed partly at least to the manure, instead of the process detailed in the article referred to. Two great objects of the farmer in this part of the country, are, to procure manure in the largest quantity without great expense, and at the same time diminish labor as much as possible consistently with the welfare of his crops. The process alluded to was adopted because it was calculated to destroy the weeds and at the same time enrich the soil without the application of manure, or much manual labor.

I would mention as a corroboration of the value of the experiment that we have just cut a crop of rye off the same piece of land referred to in the above article as sown in 1830. Owing to great pressure of business last year we omitted the process altogether, and notwithstanding the present season has been so favorable for the production of winter rye, the crop though of better quality is not so large as that obtained in 1831 when the experiment was imperfectly conducted, and the season very unfavorable.

If, sir, you will have the goodness to insert the above in your valuable paper, it will correct an erroneous impression respecting the value of the experiment, and oblige,

Yours, very respectfully, JOHN KEELY.

LAST WINTER IN EUROPE.

Some singular facts are connected with the winter which is passing over our heads. As little of severe weather has been felt in this country as under more northern skies. The merry note of the lark was heard in Denmark in the beginning of last month; nor has there been any cold of moment in the north of Russia. At St. Petersburg the thermometer never stood so low as 18½ but for a single day, and the whole season has hitherto proved unusually mild. The centre of Europe has experienced but little cold weather, and still less snow; even in Prussia scarce a flake has been seen. The south exhibits a signal con-

trast; and the midland of Asia seems to have been the rallying point of cold. Turkey in Europe, too, has been afflicted with its worst extremities; at Odessa it has prevailed without intermission; and the *Ottoman Monitor* tells us that its severity in Turkey in Asia, has been such as to have greatly contributed to the suspension of military operations. In Persia; and the southern provinces of the Russian empire, it is said to have been altogether unprecedented in its virulence. Such a thing as winter is known by name only in Tiflis and Erivan, where the roses bloom in the month of January; but this year the cold has been intenser than is ever felt even in the north of Europe.—*English Paper.*

THE WORLD IN MINIATURE.

IF we suppose the earth to be represented by a globe a foot in diameter, the distance of the sun from the earth will be about two miles; the diameter of the sun, on the same supposition, will be something above one hundred feet, and consequently his bulk such as might be made up of two hemispheres, each about the size of the dome of St. Paul's. The moon will be thirty feet from us, and her diameter three inches, about that of a cricket ball. Thus the sun would much more than occupy all the space within the moon's orbit. On the same scale, Jupiter would be above ten miles from the sun, and Uranus forty. We see then how thinly scattered through space are the heavenly bodies. The fixed stars would be at unknown distances; but probably, if all distances were thus diminished, no star would be nearer to such a one-foot earth, than the moon now is to us. On such a terrestrial globe the highest mountains would be about 1-80th of an inch high, and consequently only just distinguishable. We may imagine therefore how imperceptible would be the largest animals. The whole organized covering of such a globe would be quite undiscoverable by the eye, except perhaps by color, like the bloom on a plum. In order to restore this earth and its inhabitants to their true dimensions, we must magnify them forty millions of times; and to preserve the proportions we must increase equally the distance of the sun and of the stars from us. They seem thus to pass off into infinity; yet each of them thus removed, has its system of mechanical, and perhaps of organic processes, going on upon its surface. But the arrangements of organic life which we can see with the naked eye are few, compared with those which the microscope detects. We know that we may magnify objects thousands of times, and still discover fresh complexities of structure; if we suppose, therefore, that we increase every particle of matter in our universe, in such a proportion, in length, breadth, and thickness, we may conceive that we tend thus to bring before our apprehension a true estimate of the quantity of organized adaptations which are ready to testify the extent of the Creator's power.—[*Bridge-water Treatise*, by the Rev. W. Whewell.]

The Granite State.—Among the laws passed at the last session of the New Hampshire Legislature, was one to repeal a previous act granting a bounty upon the destruction of crows. This repeal was rendered necessary in consequence of a practice extensively prevalent of procuring crow's eggs and hatching them under hens, and bringing forward the brood for the premium. It was found that owing to this practice, the bounty was calculated rather

to increase than diminish the robbers of the corn fields. We shall lay no stress upon the report, should any such reach us, that Isaac Hill was the originator of this practice, although it must be admitted that he has a hand in hatching most of the ugly tricks which abound in that State and elsewhere.
N. Y. Spectator.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

Saturday, Aug. 3d, 1833.

S. WALKER, Roxbury, some fine specimens of Dahlias, &c.

WM. KENRICK, Newton, *Glaucium fulvum*; *Dianthus*; *Monarda didyma*; *Rudbeckia purpurea*; *Campanula alba plena*; *Phlox divaricata*; *do. pyramidalis*; *Verbasum*; *Lobelia fulgens*; *Roses* and *Double Dahlias*.

Also, a fine specimen of *Magnolia cordata*, or yellow twice flowering *Magnolia* flowers of second season.
Per order, J. WINSHIP.

In last Saturday's report, we regret that the following typographical errors occurred. For *alro-purpurea* read *atropurpurea*; for *Phlosc* read *Phlox*; for *carbata* read *barbata*; for *tenufolia* read *tenuifolia*; for *canceolata* read *lanceolata*; for *virgica* read *virginica*; for *Ibris* read *Iberis*.

FRUITS EXHIBITED.

Apples. Early Harvest, by Mr. Balch, Roxbury; Red Juneting, by Mr. Vose and Mr. Downer; William's Favorite, by Mr. Vose and Mr. Downer; River, by Mr. Downer; Shropshirevine or Sopsa vine, by Mr. Vose and Mr. Downer; Large Early Bough, by Mr. I. Prince (Coxe, No. 3) a very fine variety of sweet flavor; Moscow Transparent, by Mr. J. Prince, too acid for a desert fruit; Roxbury Russets (of the growth of 1832) by Mr. John Mackay, Weston, in a fine state of preservation.

Pears. Madeleine, by Mr. Marshall, S. Wilder; Posse Madeleine, by Mr. Downer; July or Sugar-top, by Mr. Downer and Mr. S. Walker; Fordante d'eti, by Mr. J. Prince; Bellissime d'eti, or the Breeze of Summer, (Coxe No. 6), by Mr. Manning; Early Catharine or Rousset Hatif, (Coxe No. 4), by Mr. Manning; Muscat Robert, from the garden of R. S. Rogers, Esq. Salem, by Mr. Manning.

Apricots. By Mr. S. Pond, Cambridge—large and handsome.

Plums. White Apricot, Morocco and one other variety, by Mr. Downer; Royal Tours, by Mr. P. B. Hovey, jun. Cambridgeport.

Cherries. Late Duke? from the garden of R. S. Rogers, Esq. Salem, by Mr. Manning.

By order of the Committee,

E. M. RICHARDS.

PRODUCTS OF THE KITCHEN GARDEN.

Mr. David Haggerson, from Mt. Auburn, exhibited the following Kitchen Garden products, mostly from seeds imported from Naples.

Tagginioli Mostaccli, shy bearer; Ova di trista, vetches; Cuerchie; Fagginioli di Napoli; Naples beans; Piscelli Nana, very dwarf peas, not more than eight inches high, good bearers; Tagginioli tabacchini, dwarf peas, good bearers, and very early; Tagginioli cannellini dwarf, good bearers; Pescelli nana sango filo, very dwarf, and good bearers; Tagginioli turchi, dwarf, very good bearers; Kidney beans, good bearers; Dwarf Maza-gan beans; Dwarf English Beans.

Per order, DANIEL CHANDLER.

The Yankees—the Yankees. Some weeks ago, it was announced in the Boston papers, that a cargo of ice was shipped from Boston to the East Indies. In the following account from a Quebec paper, there is another account of the manner in which the Yankees make money.

"A new instance of American enterprise and industry occurred here this week. A Mr. Baird, of the State of Maine, who has a patent for beehives, and who keeps a great number of bees, and of course trades in them, arrived at Quebec with hives, which he sold to the amount of between 2 and 300 dollars, cash. He had brought some during the winter, in his boxes of hives, in a torpid state, and found a good sale; but it seemed more difficult to remove them in the summer season, their busy and active period.—Mr. Baird, travelled only during the night and set his bees out during the day to feed and continue their work, which they did with their usual activity and regularity. He was about twelve nights on his journey by the Kennebec road, and brought the whole of his hives to Quebec in good condition without loss."—*Portland Advertiser.*

From the National Gazette.

TO MAKE THE POSOLE & SACCA OF MEXICO.
Consulate U. S. A. Campeche, 18th May, 1833.

WM. P. DEWEES, M. D. Philadelphia,

Dear Sir,—You have long known, from Humboldt, that maize is the principal food of the native people and domestic animals of Mexico, and that its alimentary preparations are as numerous and various as those of rice in China and the East Indies; but you may not yet have reflected that some of the forms in which it is used in this nominal republic, are worthy of general adoption in the United States, from the combined considerations of health, pleasure, and economy.

I therefore recommend through you to our professional brethren and fellow citizens, both medically and morally, the two fluid preparations of maize called Posole and Saccá. Both are *milky* fluids obtained from dry corn, well boiled, reduced to a fine dough by a stone roller, diffused in water, and strained through a fine sieve. The corn to make Posole is boiled with *lime*, and at least twice as long as the corn in pure water, from which is made the Saccá. The boiled corn for the Saccá, is fit for the roller when its integuments are so softened that in some grains they split open. The corn for the Posole must be boiled until its integuments are nearly consumed, and the eyes separated by the lime. The soft grains of both are converted into dough on a slight concave surface of a stone, having a gradual descent to the table, by means of another stone, long, rounded and tapering, analogous to the rolling pin of our bakers. This laborious process of the females I do not of course mention for imitation, and as little their easy method of mixing the dough and water with their unaided hands. But be the preparatory steps what they may, when once the fine farinaceous particles of this boiled and bruised corn are passed through the strainer in the shape of a white fluid—they become as agreeable to the taste as almonds under the form of Orgeat or Almendra; and when sweetened with sugar or honey, the Saccá may be mistaken for milk drawn from the cow. As in tea, coffee, and chocolate, so in Posole and Saccá, some skill is requisite in the maker; and I therefore advise you not to form a decided opinion of their merits on a few trials. When medically

presented, the physician will, of course, select the limed Posole, or the pure Saccá, according to the state of his patient's system or alimentary canal. A case of protracted intestinal hemorrhage in a lady, is now getting well under my care, without any other remedy than lime water and milk, alternated with Posole as both food and medicine.

In introducing the Saccá to American society, it may be presented under the anglicised name of maizeade, by analogy with lemonade. It may be confidently recommended to our citizens as a superior substitute for Swaim's Panacea, Chambers' Specific, or Graham's Bread, to remedy the evils for which they are respectively extolled: and I add that the habitual use of this cheap, unirritating nourishment will do more towards checking excess in spirituous liquors than all the temperance societies in the United States.

I am, sir, very respectfully, your humble and obedient servant,
HENRY PERRINE.

WE are happy in republishing the following important agricultural paper. Answers to the "interrogatories" which it contains would be as valuable to New England Farmers, as to those to whom they were originally addressed.

From the Eastern Md. Gazette.

AGRICULTURAL BOARD FOR THE EASTERN SHORE.

WHEN the Board of Agricultural Trustees for the Eastern Shore was first instituted in 1822 at a general Meeting of the Farmers of Maryland, in the city of Baltimore, it was intended that they should be in some degree, a public body, to get up Fairs and Cattle Shows and such public exhibitions as would tend to promote the welfare of Agriculture and Household Arts—and that they should give an especial portion of their time to the consideration of agricultural subjects. In pursuance of this intention, Maryland Cattle Shows and Fairs were alternately held in Baltimore and in Easton for several years, under the direction of the two boards, one for the Western, the other for the Eastern Shore, where were exhibited the various kinds of stock, horses, cattle, sheep, hogs, mules; to which was added, a show of a great variety of domestic fabrics, consisting of coarse and fine clothing useful and ornamental; of carpetings, hearth-rugs, table linen, towelling and sheeting; specimens of various fine products, and among others butter, cider, cordials and even wines, were also presented—and the proprietors of articles adjudged to be best were rewarded with honorable testimonials of different kinds of plate.

Notwithstanding it was obvious to all that these Cattle Shows and Fairs, and the means taken to to get them up and carry them through, were greatly instrumental in promoting a taste for rural pursuits—in rousing the dormant energies of our Farmers—in exciting a spirit of competition—in expanding the sphere of action, and in giving to agriculture an elevation and a rank among the professions in life which it had not in former years—the Board have been unable, after several attempts, to continue them, for the want of subscriptions to bear the necessary attendant expenses. During the years that the Cattle Shows were held, the twelve Trustees of this Board at that time were always, to a man, upon the schedule of subscribers of the highest rate, and there was no instance after the first year when a Cattle Show was held on this shore, that the members of this board had not to pay in

addition to their voluntary subscription, from eight to twelve dollars a piece to make up the deficiencies of subscription to defray the necessary cost and charges. Having failed in after attempts to procure subscriptions adequate to cover the absolutely essential expenditures, the board felt the responsibility of getting up shows and fairs taken from them, and however reluctantly yielded to a necessity that they could not avert. The board neither saw nor felt the justice or propriety of their individually paying from eight to twelve dollars a year more than all other persons for a public exhibition, in which they were no more interested than others. They considered, that if their subscriptions were equal to the highest paid by any other person, they would still be in advance in contribution, in consequence of time and trouble which they must necessarily give up, to arrange and manage the whole affair.

Thus foiled, for want of public patronage, in answering these objects of the institution, the association however has been kept up by its members to be ready to act, when a feeling more propitious to the cause of agriculture shall be testified, by a disposition to contribute the necessary means for its promotion. During this time the board has held its regular monthly meetings in rotation at the houses of its members, where they have enjoyed the hospitality of each other, where the subjects of farming, the household arts, domestic economy, and rural concerns generally, almost exclusively engrossed their attention, derived from practical exhibitions where they were, or from books, papers, or views presented through members.

Among other things, the board have been occupied with a number of interrogatories submitted by a member for consideration and answer, which embrace many of the important branches of agriculture and domestic concerns, and which they have resolved to make public, under a hope that they may arrest the attention of practical Farmers, and induce them to favor the board with their experience and views; which, if not positively forbidden by their authors, the board will feel itself at liberty to make public for the purpose of contributing to the general information and improvement.

The Board designs also to publish, in future numbers, papers which have been read before it, by its members, at various times, touching the interest of agriculture and rural economy—and such others as may from time to time be laid before it by its members or other persons. Disappointed though not dispirited at the failure of the co-operation so essential to effect the original intention in founding this Board, they are still desirous to subserve the great cause of the public and private interests in Agriculture by whatever means they may possess, and they invite free and frequent communications from all who pursue the culture of the earth or the rearing of Stock as a profession, or who regard the various employments of rural life among the most delightful of the industrious duties that we owe to society or to our country.

The following interrogatories have been for some time before the Trustees of the Board of Agriculture for the Eastern Shore, presented by one of its members, for the consideration of the Board, for the purpose of obtaining such answers as the experience of the members might afford, and with a view of giving them to the world, to draw the attention of Agriculturists to them.

Interrogatories.

1. What natural resources of manures have you? Which do you prefer, and how do you use either sort you have, and the quantity per acre.
2. What are your means of making manure and the methods you adopt?
3. Have you any particular system in relation to manures and manuring, and what is it?
4. In what state ought manure to be hauled out into the field to impart most benefit to the land and crops?
5. Have you tried various modes of planting and growing Indian corn and which do you prefer?
6. What is the best mode of laying off a farm taking into consideration fields, lots, homestead, garden, orchard and pasture?
7. What third crop, or additional crops do you believe that a farmer can most advantageously grow with a given number of hands, who grows a full crop of Indian Corn and Wheat?
8. What do you believe to be the best mode all things considered, of threshing out wheat, for farmers of moderate means, who have no other sources of support than the produce of their farms?
9. Have you any plan, or do you know of any that has been practised that makes young Horses, Cattle, Hogs or Sheep more exempt from disease—and what is it?
10. What is the best and cheapest mode of rearing colts.
11. What is the best and cheapest mode of rearing Calves?
12. What is the best and cheapest mode of keeping a stock of Hogs? Do you keep hogs of different kinds and sizes separate from each other, and how? What is the best disposal of pigs after they are weaned to make them earliest fit for the pen?
13. What species of Sheep do you consider most valuable to Farmers generally—and what is the best mode of managing sheep and lambs?
14. What is the best and most economical mode of keeping milch Cows in full milk during winter.
15. Do you consider Oxen valuable as hauling beasts—what is the best manner of breaking them to the yoke—and what the best and cheapest mode of feeding them in winter when put to severe work?
16. What is the cheapest and most attainable drench for a horse that will operate quickest and safest as a purgative? What the proportions—how mixed—and how given?
17. Are you of opinion that, by the present mode of farming, our lands are impoverished more than they were formerly? if you believe they are, what is the cause?

In attempting to draw the attention of the agricultural world to the foregoing interrogatories, and by them to such subjects as are immediately connected with agriculture, the Board are well aware that there is a vast deal of valuable information among a certain class of judicious practical farmers, who are unaccustomed to write, to which they desire to have access, that they may bring it before the world for the general instruction of all. Such farmers thus unaccustomed to commit their thoughts and views to writing, may feel a difficulty or even repugnance to appear before the world as authors. To such we say, it is so desirable to gain your knowledge and experience upon this great subject that so much concerns us all, that if you will only furnish us with the plain matters of fact, and with your experience to be laid before the Board, we will give to them the necessary form,

and treating such communications as we do those of our own members whatever we find advisable to publish we will do so, declaring the true author's name or not, as the person furnishing the information may wish.

To Farmers accustomed to commit their thoughts to paper, we would suggest, how useful they might be, not only in giving to the world the results of their own practical experience with their reasonings upon it, but in drawing upon the valuable stores of knowledge amassed by their brother farmers, before alluded to, in aiding them to communicate—or, where unobtrusive merit, chastened by habits of rural retirement, is averse to meet the public scrutiny, to collect and collate from their treasures of knowledge and practical experience, and present the valued offering to the world.

Nothing can be more desirable than a continued, regular, and general contribution of agricultural knowledge—it promotes the interest of individuals and families, and gives wealth to nations—it throws abundance and improvements all around—and whilst it is thus the means of plenty, it promotes peace—it elevates and gives dignity and eclat to the profession of the plough—it rescues it from the unmerited obloquy of being a dull, subordinate, and contracted pursuit, by showing that its sphere of action embraces earth and skies—and last though not least, it shows that the practical agriculturist, most of all men, is daily, hourly reminded of his dependence upon the Great Ruler of the Universe, on whose bounteous will, depends the success of every hour's labor—whose Sun and Clouds throw fatness over the land, and whose mercies are tasted in every fruit, and flower, and balmy breeze, as well as witnessed in every plant and blade of grass that springs.

With an earnest desire to be in some way useful to the great interests of agriculture, the Board is ever ready to fulfil the original objects of its institution in promoting Cattle Shows and Fairs whenever a disposition is manifested by the community to bear with them an equal portion of the necessary incidental pecuniary charges—until which time they are disposed to give all aid in their power to another object, viz. that of collecting and diffusing abroad the best agricultural knowledge and experience within their reach, to enable them to do which more effectually they invite the co-operation of agriculturists far and near.

By order of the Board,

R. H. GOLDSBOROUGH, Chairman.

MARTIN GOLDSBOROUGH, Sec'y.

WHEAT FLOUR.

In looking over a small volume, entitled "Philosophical Recreations," published by John Babcock, Esq. London, we meet with the subjoined method of testing wheat flour. As we knew of no better means whereby the purity of this "Staff of Life" could be ascertained, and supposed that in this respect there were many like us, we concluded it would be well to transfer it to our own paper for the benefit of its readers:

"Flour which is pure and unadulterated, may be known by your seizing a handful briskly, and squeezing it half a minute; it preserves the form of the hand in one piece, although placed rudely on the table. Not so with that which contains foreign substances; its adhesive property is weak, and it falls to pieces immediately. The whiteness of flour is no evidence of its goodness; the different materials used in adulterating flour, have a tendency to whiten it.—*Maryland Republican.*

THE CHOLERA.

At Cincinnati, for the week ending on the 15th there were forty-six deaths, 24 of which were returned as of cholera. During the corresponding week of 1832, there were only 15 interments.

At Lexington, Ky., from the first breaking out of the disease up to the 14th June, the number of deaths is variously estimated at from 200 to 350, including many persons of great worth and respectability.

At Wheeling on the 20th, 3 cases and four deaths.

At Bridgeport it has abated. At Maysville it still prevails. At Nashville it was also abating.

The papers teem with prescriptions for the cure of cholera, and we have given one or two of them. The disease varies so much that reliance can be placed on none of them. All cases of diarrhoea ought to be immediately attended to, and the judgment of the physician must be mainly depended on.

Remedies. Dr. McNairy of Nashville, during the prevalence of the cholera, had 50 cases and lost but one. His remedy was to dissolve a table spoonful of salt in a common sized tumbler of hot water, and 3 or 4 glasses will generally vomit, keep up the vomiting until the stomach is completely unloaded, then administer a dose of oil, or oil and calomel.

Dr. Drake of Cincinnati says, the first symptoms of cholera are, in most cases, a diarrhoea or lax, slight sickness of stomach, weakness of the limbs and dizziness. Of all the directions that could be given against the epidemic, none is so important as to attend at once to these early symptoms. They are best removed by an early dose of calomel, of 10 or 15 grains; to which, if the individual have much pain or is chilly, or the lax is profuse, a grain of opium, with or without a couple of grains of red or black pepper or camphor should be added.—The dose may be repeated every 2, 4, or 6 hours, during which the patient should take little other drink than warm ley of common wood ashes. All who are suddenly or violently attacked with these symptoms, or have fever, should be bled; and if the feet be cold, bathe them in hot salt water. They should likewise lie down, as nothing is so apt to convert a mild into a fatal case, as going about. Finally, all who may be affected, even in the slightest degree, should refrain entirely from solid food, and take gruel or weak broth.

At Maysville, Ky., all the usual remedies failed, and it is said that the Thompsonian practice succeeded.

The cholera has prevailed and is prevailing at Flemingsburg, Washington, Georgetown, Paris and Cynthia, and in the neighborhood of those places, in Kentucky; at Aurora and Brookville in Indiana, and at Columbia, below the mouth of little Miami. Dr. Drake is decidedly of the opinion that the whole western country will be visited by it during the present year.

How truly may it be said, that "in the midst of life we are in death!" A dreadful pestilence is spreading its wing over the land, levelling all before it: it spares neither age nor sex, the temperate as well as the intemperate, the righteous as well as the unrighteous, are alike subject to its fatal influence. And now the admonition, "Set thine house in order for thou shalt surely die," comes upon each and all of us with full force, invoking us to prepare for the changes that await the children of men.—*Ohio Repository.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUGUST 7, 1833.

Black Sea Wheat—May be seen at the New England Seed Store, No. 51 North Market street, a sample of a valuable and beautiful kind of wheat called the BLACK SEA WHEAT. The seed, which produced the specimen to which we allude, was procured by Mr. G. C. BARRETT, Proprietor of said seed store, from E. MARVIN, Esq. a distinguished cultivator of Chatauque county, N. Y. Mr. Marvin procured this wheat originally from the country in the neighborhood of the Black Sea, and has, since that time, cultivated and distributed it extensively and liberally.

Its advantages, according to Mr. Marvin, are that it will bear late sowing, and thus "escapes three important accidents: it will not be thrown out of the ground by frost, nor killed by deep snows, and no insect can find a home in the stalk or root during the winter; so that if the spring is favorable there is nothing to prevent its coming forward with a strong and rapid growth.

The sample was raised by Mr. Springer of Sterling, Mass. and appears as well as the original kind with which it may be compared. Some of the heads as well as the kernels may be seen as above; and we are assured that 20 heads have been produced from one seed. We think this variety of wheat will prove a very important acquisition to New England.

To Thos. G. Fessenden, D. A. A. That is Dr. of the Agricultural Art, or Dr. of the Art of Arts, on which all others, in truth depend.

Dear Doctor, Don't be offended at the title. I know very well how cheap degrees have got to be of late; and I confess I should feel it something very near to an insult to confer on a man really qualified for the honor any such nick name as LL. D. Yet Dr. in Agriculture, the Art of all Arts, has not yet been prostituted to any miserable purpose of party or flattery, and, therefore, of our free will "et pro auctoritate mihi commissa" we give it to you as an honor by no one better deserved, and by no one more likely to be respectably worn.

Now, Dear Doctor, learned in this noble science, please to give us your opinion in a case where your early decision is deemed highly important. What then, venerable Doctor, is your opinion as to the expediency of suckering corn, when the growth is extraordinarily luxuriant. Will it do good or will it do harm, or will it do neither? What facts have come under your observation? What does your philosophy dictate? What does your experience command.

Now, sage philosopher, occupying the chair of the learned and the wise! "Shake your ambrosial curls and give the nod." Shall the suckers fall or shall they remain? Instruct us in this point of agricultural law, and as in duty bound will ever pray many a listening

July 25, 1833.

DISCIPLE.

By the Editor. No doubt we have as much reason to boast of our "Disciple" as the celebrated Stagyrte had to be proud of his royal pupil. If our querist is not so great a *hero* as "Macedonia's madman" he is probably a better man, as well as a more scientific agriculturist; and we consider a good cultivator to be as much superior to a great conqueror as the top of the atmosphere is above

the centre of gravity. We will therefore, by particular request, "assume the god, affect to nod and try to shake the spheres." In other words we will take on ourself such airs of authority as may be requisite to cause our official dignity of "D. A. A." [not BAH] with which we have been so honorably dubbed to be as "respectably worn;" and become us as well as doth the personation of wisdom the Bird of Minerva. Yea, we will sit on our tripod, and utter our oracular responses with as much decision and precision as if our neck and shoulders were surmounted by as genuine a block as ever was carved from a venerable oak, which whilom decorated the grove of Dodona, or cast a shadow to the sunshine which gilds the vale of Tempe.

But a truce with bagatelle.

It seems to be a point not yet fully settled whether it is best to cut off or otherwise destroy the suckers of Indian corn. Mr. Nicholson, in the *Farmer's Assistant* observed that "the growth of suckers is injurious to the crop, and ought to be either pulled up, or bent down to the ground, with earth sufficient to kill them; and this is believed to be the better way, as by this mean the principal stalk is not injured by wounding." We believe that in cultivating premium crops in Massachusetts the suckers were, generally, taken away. In the Hon. Mr. Hunnewell's account of his raising a crop of one hundred and eleven bushels of corn to an acre (*Mass. Agr. Journal*, vol. vi. page 242,) it is stated that "immediately after half hilling the suckers were all carefully cut off." In a number of other notices of processes of cultivation in obtaining large crops of corn, which may be seen in several of the earlier volumes of the N. E. Farmer, we may find that the suckers were generally taken off.

A Mr. Lemuel Davis, however, of Holden, Mass. by an experiment, which is related in the N. E. Farmer, vol. i. p. 8, ascertained as he supposed that it was injurious to cut off the suckers. This gentleman stated that when he cut off the suckers from the stalks, he found "such a proportion of the juice wept out where the sucker was taken off that the growth was not so large and the ear sat higher on the stalk; on the part where the sucker was not taken off, the corn was thicker set and more prominent—the ears set ten or twelve inches nearer the ground, and were a good proportion larger." On the whole, we think that farther and exact experiments on this subject, with reports of their results, are desiderata in the science of agriculture.

Brooks' Patent Silk Spinner. A very ingenious machine for spinning and twisting silk has lately been invented by Mr. Adam Brooks, of Scituate, Mass. and has been for some days past exhibited at the Agricultural Warehouse and the Rooms of the Mass. Horticultural Society in Boston. It has been highly recommended by the best judges for the following properties, as stated by Rev. SAMUEL DEANE, viz.:

"It performs three operations at the same time. I. Reeling from the cocoon: and in this operation it has an obvious advantage over the Piedmontese Reel in the arranging of the guide wires so as to avoid tangling and breaking the filaments of silk. II. Spinning or twisting the silk. This being done immediately as it is drawn from the cocoons, while properly moistened, and its natural glue softened, the silk runs in a perfectly even thread. III. Doubling and twisting." These processes

being performed at once, and before the glue of the silk has hardened, give advantages, which can be obtained by no other machinery heretofore invented. The apparatus is small, not complicated, well adapted to domestic use, and it appears to us calculated to introduce as important an era in the manufacture of silk as the inventions of Arkwright and Whitney produced in that of cotton.

ITEMS OF INTELLIGENCE.

A violent storm was experienced at St. Louis, Missouri, 27th June. Many houses received injury. Large warehouses were prostrated, buildings unroofed, trees uprooted, &c. A market house was overthrown, the pillars gave way, and the roof was removed at least 25 feet. A negro woman was killed by lightning.

A man residing in East Haven, Conn. was bitten by a rattlesnake last week, and died in half an hour. The snake was about the unfortunate man's wood-house, and was not perceived by him until he felt his fatal fangs.

Two persons were killed by lightning in Montgomery co. Md. during the storm on the afternoon of the 14th ult.

A little boy, 8 or 9 years of age, son of Chauncey Burrington of Conneaut, Ohio, attended a raising in his neighborhood, and was prevailed upon by several boys older than himself, to drink whiskey in such immoderate quantities that it caused convulsions, and finally terminated his existence.

Extraordinary Mortality. We have been informed, that on the estate of Gen. Wade Hampton, on the Mississippi, a little above New Orleans, out of fifteen hundred slaves, more than seven hundred have been destroyed by the cholera.—*Richmond Compiler.*

It is stated in agricultural periodicals, that stacking grain around a green pole of Sassafras, will effectually prevent any injury from the Weevil. The experiment has been tried in numerous instances, and in all cases the result has been satisfactory.—*Vermont Republican.*

A South Carolina paper mentions a lady of that State who has one hundred thousand silk worms busily engaged, and that she expects to raise silk enough by the latter part of August, to manufacture more than a hundred yards of cloth. Two other ladies are also mentioned who have made silk cloth, and sold it for \$3 per yard.

Another Barn burnt by Lightning. On Saturday morning last, between 2 and 3 o'clock, another violent gust visited this part of the country, of short duration. The barn of Mr. Philip Kline near Bernville, in this county, was struck by the electric fluid and entirely consumed, with a large stock of hay, grain, &c. This makes the third barn, destroyed by lightning, in this neighborhood, in less than a week's time. *Neither of them were protected by lightning rods.* Is this not proof enough, that a newly filled barn possesses an unusual degree of attraction to the fluid? Why then do our farmers, who are characteristic for their prudence in other matters, neglect the precaution of attaching conductors to their buildings? A few dollars expended by each, in this useful appendage, would have saved them thousands.—*U. S. Gazette.*

CHOLERA. We are glad to perceive, by late accounts from the west, that the cholera is subsiding in places where it lately prevailed. There are still some scattering cases. It is said, that in Missouri the German emigrants have been the greatest sufferers being crowded into small uncomfortable houses, and otherwise badly provided for.

It appears that 300,000 bushels of grain have been destroyed by late freshets in the neighborhood of Richmond, Virginia.

MISCELLANY.

For the New England Farmer.

THE STORM.

A THUNDERSHOWER about this time
Undoubtedly is coming,
But should an almanack say when
'Twere all a knack at humming.

But if the weather's very warm,
And you have wheat and rye down,
Don't after sun-rise lie in bed,
Nor after dinner lie down.

For, low down in the murky west,
A sullen congregation
Of vapors lower, in horror drest,
And menace desolation!

A storm anon comes howling on,
Its retinue a posse
Of clouds convolving over clouds
Like Pelion heap'd on Ossa.

Now the whole mass comes rushing down
By ten-fold thunders roared,
As if the heavens in ruin hurl'd
Had on the earth descended!

JONATHAN'S VISIT TO A PRINTING-OFFICE.

DID you ever go up to the Printers,
And see all them devils to work?
I cossnotchet it beats all to flinters
Mother's fuss when we kill all our pork.

Them fellers they stand right up straight,
And pick little pieces of lead;
Stuck in little cubby holes thicker, I'll bate,
'Than seeds in our big parsnip bed.

'Then they keep such a ducking and bobbing,
I'll be darn'd! like aunt Peggy's old drake
When he's gobbling up corn, or a robin
That stands in one leg on a stake.

How plague can they find all the letters,
Is more than my gumption can tell;
They call them are workmen type setters,
And an old shoe, they said that was hell.*

Then they've got too a cast iron press,
It beats father's for cider and cheese;
'Tis tarnation hard work I should guess,
And it gives a confounded tight squeeze.

There's a thumping great roller I swow
They keep pushing—the Lord knows for what;
And the paper 'twould cover our mow,
Such a whapping great sheet have they got.

How they fill it all up is the wonder,
Where the darn do they find so much news,
As thick as pea blossoms in summer—
What a nation of ink they do use!

By gall! I don't see how they pay
For so many heaps of white paper,
They tell'd me they used every day;
Good Lord—it would ruin Squire Taber.

I'd no notion, I vum, 'twas such tarnel
Hard work to print papers and books;
I'll go right down and scribe for the Jarrel
And go home and tell all the folks.

Abuse not always an Injury. A well regulated mind does not regard the abusive language of a worthless reviler (in the light of an insult,) and deems it beneath notice; mentally reciting the couplet,

"A moral, sensible, and well-bred man
Will not abuse me, and no other can."

* The old shoe kept as a receptacle for broken types. The devil, no doubt, imposed upon the simplicity of Jonathan.

A CHAPTER ON HATS.

"Your bonnet to its right use, 'tis for the head."

THERE is no people so ingenious at expedients as the Yankees. It would never enter the heads of persons out of New-England to use their hats for any other purpose than as a covering for their heads. In other parts of the globe when a man bows graciously to a friend *he takes off his hat*. Such a custom cannot be adopted here—for a man's hat is his pocket book, his satchell, his pantry, his clothes bag, his tool chest, or his sugar-box, as occasion may require; and if he should take off his hat in a hurry, awkward consequences must needs ensue. We once knew a young gentleman having purchased a dozen of eggs for his mother, forthwith *popped them into his hat*. On his way home, he met a pretty girl, with whose charms he had long been smitten, and wishing to be particularly polite, he *took off his hat*, preparatory to making a low bow. The twelve eggs obeying the laws of gravitation, of course were precipitated to the pavement and instantly smashed to atoms, and the beautiful white garment of the astonished girl, was bespattered with the filthy yolks! She never forgave him.

How often during a windy day do we see a *halless* wight chasing a cloud of papers, which have made their escape, and are borne away on the wings of the wind. A clergyman lately, who had been recently settled in a flourishing village, was wont to cross a small stream on a bridge, which lay between his domicile and the Meeting House. One memorable day, as he was crossing the bridge when rude Boreas was raging, his hat was blown from his head, and quietly deposited in the stream—but his written discourse being somewhat *lighter* than the hat in which it was of course deposited, was carried somewhat further and was never heard of more.

It has been remarked by foreigners that the natives of New England are generally round shouldered. This is undoubtedly owing to the enormous weight which they carry on their heads! A lawyer is seldom seen with a green bag in his hand—his legal documents, and sometimes his law books are deposited in his hat; a physician's hat is not unfrequently an apothecary shop in miniature; a merchant's hat is crammed with merchandize; and a stage-driver's hat is stuffed with bundles and packages. A person about to take a short journey seldom burthens himself with a trunk, but takes a change of apparel in *his hat*. A late member of the Massachusetts Legislature, who represented a town not more than twenty miles from Boston, always carried his dinner to the State House in *his hat*; and we have seldom seen the hat of an editor which was not stuffed with damp newspapers, stolen paragraphs and unanswered duns! Hence editors are *always* round shouldered.

The change which has lately been effected in the shape of the hat, has been loudly complained of, as its reduced dimensions puts the wearers to much inconvenience. A hat of the most approved modern style, will contain little else than a pocket handkerchief, a pair of gloves, and a few cigars. But we hope this change in fashion will produce a corresponding change in the *perpendicularity* of certain individuals; and that those persons who hang down their heads while wearing a bell-crowned hat will soon strut about as stiff and upright as a platoon of well-drilled soldiers

An old maiden lady named Witman, in the 80th year of her age, mowed and made an acre of heavy grass into hay, in Mountjoy, Penn. a week or two since.

WHOLESALE AND RETAIL CASH STORE.

ELIAB STONE BREWER, No. 414, Washington Street, (South end) has received a general assortment of *Spring and Summer Goods*, among which are 100 cases English, French and American Prints of all prices and qualities—20 cases Petticoat Robes—1 case Cambric Muslins, some of which are very fine—1 case Cotton Cambrics do. do.—1 case White Lilies for lining ladies dresses—1 case Book Binders' Cambric for do. do.—3 cases do.—100 cases bleached and brown Sheet and Shirting, some extra fine—1 case Marselles Quilts, from 8 to 10 quarters—5 cases London Rose Blankets, some of a very superior quality and large size—1 case Hearth Rugs—4 cases Chapp's spool 6 cord cotton, warranted—200 yards superior quality—5 cases Clark's do. at very low prices by doz. or case—2000 fancy boxes—a large variety of colored and black French Silks at very reduced prices—2 cases col'd Battiste—1 case black and colored Borage—4 cases French and London printed Muslins of new patterns and beautiful colors—2 cases three corded superfine Italianettes, black and fashionable colors—1 case common do.—1 case Plaid Palmgrim's super quality—1 case Pou de Soi a genteel article for ladies' summer dresses, 9d per yd—20 ps super mix'd, drab, and olive Merino Cassinets for children's summer dresses—20 ps Rouen Cassimere with a large variety of superfine and fine Broadcloths and Cassimeres—20 bales Pelisse Wadding—3 cases superior Ticking—4 cases cheap do.—10 cases improved soft finished 4-4 Irish Linen, manufactured for the London market and imported expressly for the subscriber.

The above goods are offered for cash only at prices so extremely low as will make it an object for purchasers either by piece or yard to call and see. May 29

FARMER'S OWN BOOK.

For sale at the New England Farmer office the Farmer's Own Book or Family Receipts. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 60 cents.

Also, the FRUGAL HOUSEWIFE, by Mrs. Child, dedicated to those who are not ashamed of economy,—a work which should be in every family. Price 50 cents.

FOR SALE,

THAT valuable FARM, late the residence of Mrs. RUTH MACKAY, in Weston. It contains 110 acres of as good, and as well watered land, as there is within 100 miles of Boston. On 40 acres there is a thrifty wood lot of white oak and walnut, a fine young Apple Orchard which gained the premium of the Massachusetts Agricultural Society, a Peach Orchard, for which the Horticultural Society granted a premium on peaches, with all the new varieties of Pears and Cherries, Quinces, and other choice fruits, the farm is in a high state of cultivation, and enclosed with strong stone walls. There is a good house with 4 rooms on the floor, 2 kitchens. Barn, granary, chaise and wood house, cider mill. It is 14 miles from Boston on the great post road to New York, 1-4th of a mile from the road. The place has many advantages, both for the Farmer and the gentleman. It can be seen at any time by calling there, or on application to JOHN MACKAY, at 416 Washington-str. July 3 ew3w&ew9w

THE NEW ENGLAND FARMER

COMMUNICATIONS.

For the New England Farmer.

CHLORIDE OF LIME AND PULMONARY COMPLAINTS.

THE following communication and certificate annexed, afford a fair promise of a specific against one of the most formidable and obstinate of all the diseases to which mankind are liable.

To the Editor of the New England Farmer,

SIR, I hope you will not think me guilty of flattery when I speak of the value to myself and the public of your interesting journal. You publish experiments upon the human system of gentlemen of high respectability, as well as essays, &c. on Agriculture. On reading the experiments so very interesting in pulmonary complaints by Dr. Cotterren (N. E. Farmer, Vol. XI, No. 19, page 147,) in Paris, France, on patients afflicted with consumption, I ventured to try the experiment of inhaling the gaseous perfume of chlorate of lime on a young man, a nephew to my wife, whose certificate accompanies this communication, and which I took myself; after his health had so improved as to visit me, (a ride of 5 miles.) He is about 25 years of age, of steady habits, and industrious. I visited him after he had been sick five or six weeks, and thought him not so sick as I expected to find him, although much reduced. I returned home in hopes I should hear he was better, but every day brought tidings of his growing worse. A second physician was called, a gentleman of eminence in his profession: I saw him, who informed me he feared his case was doubtful. Some of my family visited him, the answer was he grew worse, was wasting very fast, and according to human view was rapidly approaching the close of life. All this time the article above alluded to never entered my mind, till the young man was in the last stages of a consumption. One Sabbath evening, after retiring, not having much inclination to sleep, I was thinking of this distressed family, Dr. Cotterren's experiment darted into my mind. The next morning I spoke of it in my family—my oldest son (who had witnessed the surprising effect which chloride of lime had upon the corpse of a young man who had been dead four days and brought almost sixty miles in a wagon over a rough road in a new country, one year ago in June last) was very urgent for the application to his cousin. It was procured by sending four miles; my son went with it, and administered it watching through the night. Neither of us possessing any medical knowledge, I advised him to use it with caution, and at first there was no apparatus used. Some was prepared by putting a quarter of a pound into a junk bottle, filling the bottle with soft water, shaking it a little, letting it stand till settled, pouring it into a saucer, and to a gill adding half as much vinegar, when it is then fit for use. The saucer was placed near the bed; finding no unpleasant sensations it was put near to his mouth and nose, advising the sick man to shut his mouth and inhale the fumes through the proper orifice to the lungs. A free use was made of it all the night; the liquid in a vessel was rather inconvenient, a rag was wet, he said he received it stronger from the rag than any other way. My

son left him in the morning more comfortable than he had been for several days. The use of it was continued, and the sick man's health improved to the astonishment of all who saw him. The above, together with the certificate, are the facts as they took place; and the young man's health has improved so much in the short space of time that he is able to transact business, and do some labor every day at the date of this communication.

I hope that a further trial will be made by those afflicted with disordered lungs and the result published, as the ingredient is so cheap, and the application so simple and easy, and it is obtainable by every person in every situation of life. I hope that this case may be published in every journal, as there was no other medicine used and the effect was so salutary.

Yours, respectfully, JAMES WALKER.
Fryeburg, Me., Aug. 3, 1833.

CERTIFICATE OF CALEB WARREN, JR.

I hereby certify that I was taken sick the sixth day of April, 1833, with an inflammatory fever, as my physicians called it. My complaint was a pain in the left side, in the greatest extreme, which caused an inflammation on my lungs, which of course ulcerated, attended with a distressing cough, which brought up the matter that had supplicated upon my lungs in such quantities that I was almost strangled by the discharge. I was sick nearly three months; was so much reduced that I could not sit in a chair without being supported by one person, while another made my bed. I called a second physician, who met my former doctor: they examined my case, and considered it doubtful. I followed the direction of both the gentlemen, but my lungs were so diseased that I grew worse every day. My case was now considered hopeless. My doctor told me he could do no more for me. At this stage of my disorder I was advised by my uncle Walker to inhale the fume of chloride of lime, which I did, and received immediate relief. About the 25th of June, when I was at the lowest, some days I brought up more than two quarts of matter from my lungs in the course of 24 hours; but after inhaling the fume of the lime a short space my cough abated, and I ceased to bring up the matter from my lungs as I had done before. I never brought up any but once after inhaling the lime; my health improved much faster than I could expect. In six days I could walk about the room; the ninth I walked out of doors; the twelfth I rode a mile on horseback, and now my health is fast improving. I made use of no other kind of medicine whatever.

CALEB WARREN, JR.
Denmark, Me. July 13th, 1833.

BOSTON, AUGUST 2, 1832.

To the Mayor of the city of Boston:

SIR: The undersigned committee of physicians of the city of Boston being convened in consequence of a communication received from you, ask leave through the medium of the city government, to warn their fellow-citizens of the danger of eating unripe fruit and uncooked vegetables. The present is the season at which Cholera Morbus and other affections of the bowels prove mortal to a great

number of individuals. The common causes of these diseases are eating too freely, eating improper substances and unusual exposure to cold and moisture. We respectfully invite you to suggest to our fellow-citizens the practice of a reasonable caution in regard to these causes of disease. To avoid misconceptions on a subject so important to health, we wish to have it understood as our opinion, that ripe fruits and wholesome vegetables used with moderation, constitute a most salutary kind of food at this period of the year.

JOHN C. WARREN, JOHN RANDALL,
BENJ. SHURTELEFF, GEO. C. SHATTUCK,
GEORGE HAYWARD,

From Goodsell's Genesee Farmer.
BEES.

If you should consider the following plain communication of facts worthy of a place in your paper, you are at liberty to insert it, hoping that it may prompt some other person to convert a useless garret into a source of amusement and profit.

Much has been written of late respecting Bees. Two years since I learned that bees might be kept to advantage in a garret. At that time I was building a stone house two stories high, and directed the mason to leave a hole in the end eight inches wide and one and a half high; the bottom level with the garret floor, having determined to give this method a fair trial. I delayed putting in the bees until I had a swarm last year. The swarm was first put into a hive twenty inches deep and ten in diameter. I placed this hive on the floor six inches from the wall, and about the same distance from the chimney opposite the hole left in the wall. They nearly filled the hive last year, and this season they have not only completed the filling of the hive but have filled the space between the hive and the wall, and also between the chimney and hive, and are now building on the outside of the hive opposite the chimney, and have raised the comb several inches above the hive. Although the bees have increased in numbers to that extent that they cover the wall for two feet above the hive yet they continue to work well, and there is no appearance of their being disposed to swarm. I have one inconvenience with them, if a door or window is open at the end of the house they sometimes enter by mistake where they often remain as Ulmus says "bunting their heads against the windows" until they fall down and die if they are not turned out of doors. I have given the bees the whole of the garret which is twenty-two by thirty six feet, no light is admitted except by the hole where they enter, which hole I fear may prove too small for them hereafter, should they continue to increase, as it now appears to be filled with bees passing in and out, but none are seen lying about the outlet as is the case when the common hive is used.

LAWSON HARMON, JR.
Wheatland, July 29th, 1833.

NOTE.—We are under obligations to Mr. Harmon for his communication on bees; for it is by such communications of facts, derived from the best possible authority, that we shall attempt to persuade our farmers to vary in some instances

from the common track. It is well known that we have been opposed to the idea that there must be a perfect overturning in the system of farming before Agriculture can be pursued with honor or profit, such is not the case. If farmers will do honor to themselves they will be honored by others, and if they will study to make themselves acquainted with all the advantages and disadvantages with which they are surrounded, interest will prompt them to adopt that course which is most likely to be attended with profit.

From the National Intelligencer.
GAMA GRASS.

WE avail ourselves of the following account of this extraordinary Grass, which appears in the last *Fayetteville (N. C.) Observer*, under the signature of a gentleman of Wilmington, in that State, on whose statements implicit reliance may be placed.

Sampson County, July 20, 1833.

MR. HALE: When we were together, a short time since, I promised to send you some account and description of the GAMA GRASS, with the result of such experiments as I had made with it.

The first notice I saw of this grass, was by Doctor Hardeman, of Missouri: whose account of its wonderful production, and valuable properties, may be found in the 8th vol. of the *American Farmer*, page 244. I considered the calculations he made of results, visionary, and had forgotten it.

It, however, attracted the attention of Mr. James Magoffin, of Alabama, who procured some seed, and has now been cultivating it several years. The result of his experiments may be seen in the 13th vol. of the *American Farmer*, pages 50, 143, and 215. Also, in the 4th vol. of the *Southern Agriculturist*, pages 312 and 475.

Further experiments with this grass are detailed by Mr. William Ellison, in the 4th vol. of the *Southern Agriculturist*, page 404, and 5th vol. of the same work, page 5. To these several communications, I would refer such of your readers as have those works, for a better and more particular description of the grass, than I can give them. [N. B. Such Farmers as can afford to pay the cost of the *American Farmer* and *Southern Agriculturist*, and neglect to subscribe for them, or one of them, do not deserve the benefit of any improvement or discovery in Agriculture.]

The combined results of the experiments of these gentlemen show, that the quantity of hay which this grass yields, is far greater than any heretofore tried. That the quality of the hay is equal to any other; and that, both when green, and when cured, it is greedily eaten by stock of all kinds. Mr. Magoffin informs us, he has actually made at the rate of ninety tons of green hay per acre in one year—equal to between 20 and 30 tons of cured hay. Dr. Hardeman states, that a single root, covering a circle, the diameter of which was two feet, yielded at one cutting 52 lbs. of green hay, which when dried weighed 20 lbs.; and consequently, that an acre of ground, filled with roots equally productive, would yield more than 270 tons of hay. However exorbitant these accounts may appear at first, the high standing of these gentlemen leaves no room to doubt their accuracy.—My own experiments induce me to believe, that under circumstances, in all regards favorable, they may be realized.

Of the immense value of this grass to us, in a

hot climate, and on a sandy soil, no doubts can exist.

I have ascertained the following facts, with certainty. That it grows spontaneously and luxuriantly, in our country, on alluvial bottom, and rotten lime stone lands. I have planted it in a poor sandy loam on a clay foundation, (such as is the general quality of the stiff pine lands of our country,) and on a sand hill, originally as barren, and as arid, as the deserts of Arabia. These soils, well manured, produce it abundantly. Even the long drought of 1832, (which, with me, continued from 23d May, to 1st August, with the exception of one slight rain on the 9th of July,) did not materially affect its growth. It may be cut as early as the 1st of May, and the cutting repeated every thirty days, until frost. It ought to be planted in drills three feet apart, and two feet space between the roots. An acre will then contain 7,350 roots. A single root, of the second year's growth, (on the dry sand hill,) at three cuttings, has this year already yielded 7½ lbs. of green hay, and will without doubt yield at least as much more before frost. At that rate, an acre of pure sand hill, well manured, would yield 55 tons of green hay, equal to about 18 tons of cured hay, of a quality as good as the best blade fodder.

In January last, I drilled some seed, in drills two feet apart, with seed dropped at intervals of six inches, intended for transplanting next Fall.—The whole ground is now covered with a mass of grass 2½ feet high. On the 10th of this month I cut and weighed the product of one drill 35 feet long. It yielded 25 lbs. of green hay, which, when cured, produced 8 lbs. of delightful forage. At this rate, an acre would yield 15,750 lbs. of green hay at one cutting. It may yet be cut three times more, and consequently, the product would be 63,000 lbs. of green hay, from seed planted in January last. The product of old roots is from two to three fold. These seeds are planted on pine land, with a poor sandy loam on the surface, with a clay foundation—well manured. I have not made any experiment with this grass, on any other soils than those above specified, but I know it grows much more luxuriantly on alluvial bottom, and rotten lime stone lands.

Mr. Magoffin is certainly mistaken, when he supposes this grass is found indigenous, only, in the western prairies. He furnished me with a few seeds of his own raising. I also procured some from Mr. Ellison, of South Carolina, which grew in Fairfield District, and some from Gen. Owen, which grew spontaneously on his plantation in Bladen county in this State, on the alluvial soil of the Cape Fear.*

They are all planted near each other; and are, unquestionably, the same species of grass. There is not the least difference between that found in this State, and that from South Carolina. That sent me by Mr. Magoffin, from Alabama, is a little different in color, being of a pale hue, and of a little finer texture.

This grass is, without doubt, the 'Tripsacum' of botanists. In Elliott's Botany of South Carolina and Georgia, vol. 2d, page 522, two varieties are described:

"1st. Dactyloides—Root perennial—Stem 4 to

* A well known writer in the Newbern Spectator of the 19th instant, (H. B. C.) states that during the last year he found the Gama grass on the shore of the Neuse river, and that a gentleman in Florida assured him he had found it in that Territory.—Editor of the Observer.

5 feet long—Leaves large, 3 feet long, 1½ inches wide—Flowers, in terminal spikes—Spikes numerous—Very rare—have only seen it growing on the margin of the Ogeechee river—Flowers from May to July."

"2d. Monostachyon—Root, perennial—Stem, 3 to 5 feet long—Leaves 1 to 3 feet long, 1 inch wide—Spike, solitary—Flowers in terminal spikes—Grows abundantly on the Sea Islands, (particularly on Paris Island) and along the margin of the salt water—Flowers from August to October."

For any practical purpose, there is no difference between these two varieties. They are found growing together.

The following characteristics will render this Grass obvious to common observers:

It grows in tufts or bunches, measuring about two feet across and three in height, which tufts are composed of numerous branches, springing from a common root, which is tuberous in its form for about three inches, and terminates in many small, but strong radicles. These branches in their origin, form the common root, and have a peculiar arrangement; being produced from two opposite sides of the tuberous portion only, and departing from it at an angle in opposite directions, gives to this part of the plant a flat shape.

The leaves which (previous to the period of flowering) all issue from the root, are of a deep green color, from two to three feet long, and from 1 to 1½ inches wide, are shaped like a blade of fodder, but are sawed or rough on the edges, particularly towards the point. The leaves commence in a sheath, at the bottom, which encloses and covers the origin of several other interior leaves. About the last of May, a number of flower stems shoot up from different parts of the bunch, and grow from 3 to 7 feet high, and terminate in one, two, or more finger-like appendages (called by botanists spikes.) The upper end of the spike, resembles a single spike of the tassel of Indian corn, and has a blossom (farina) on it. The seeds, (which vary from 3 to 6 on each spike) are embedded immediately below this tassel, and when flowering, each has a single tag, of a deep purple color, resembling the silk of Indian corn. The tassel drops as soon as it has shed its pollen, and then the seeds ripen, one by one, and drop off. The seeds are imbedded on opposite sides of the stem, and attached together, after the manner of the rattles of a rattle snake.

The flower stem is jointed and clothed with leaves, much shorter than those which proceed from the root, the sheaths of which embrace the stem, to within a short space of the next joint. It is channelled on alternate sides, like a stalk of corn. When full grown, it puts out branches at nearly every joint, which terminate and produce seeds like the main stem.

I have been thus particular in my description, to enable persons to search out this grass. I am satisfied it will be the source of much wealth and comfort in our pine country particularly. It is certainly the spontaneous product of our own State. I know it grows in New Hanover, Brunswick and Bladen Counties, and have been informed it is found in Craven and Orange, and may, probably, on any of our alluvial bottoms.

Now is the time to search for it. It is in bloom and more readily identified, by the peculiarity of the seed. When not in bloom, it very much resembles some other grasses which are different in their nature, and not so valuable. I might add

much more regarding it, but again refer your readers to the essays above referred to.

Very respectfully, yours,
WM. B. MEARES.

EDITORIAL.

On raising Apple Trees from Seeds, Cross-fertilization, &c.—The following is the substance of an article which was published in the *Horticultural Register* for May last, with the signature J. C. K.

The best time to sow apple seeds is in autumn, immediately after they have been taken from the fruit; for if delayed till spring, the greater part will be found to have lost their germinating power. But if it is determined to keep them, they must be mixed with sand and closed from the air; this occasions considerable trouble, if the pippins of different varieties, as they always should be, are preserved distinct.

In practising cross fertilization the writer adopts the following mode:

"After selecting a few conveniently situated branchlets, in different parts of a tree, I remove all the blossoms, with the exception of three or four of the most promising, from which, a day or two before their expansion, I extract the anthers with a small pair of scissors, or tweezers, and cover each branchlet with a piece of thin gauze, taking care that no opening be left by which bees, flies, or other insects, might gain admission, and thereby mar the experiment by bearing to the stigma the pollen of some variety other than the one I may desire to employ. The gauze should also be rendered secure, so that the wind may not partially open it, nor entirely carry it away. When the blossoms are fully expanded, and the stigma by bursting is ready to receive the influence of the pollen, it must be supplied by the application of a flower of whatever variety has been fixed upon as the male parent, and the gauze replaced till the fruit is set. As the fruit increases in size, if more than one or two remain, judge which gives the best promise of attaining perfection, and the rest remove; it will be advisable to distinguish each branch by a label affixed. The above, or some similar method alone can determine with any certainty which is the male parent; or indeed there may be many, which accounts for the diversity of the products obtained from seeds of the same individual fruit.

"Last year I gathered the first produce of some seedling strawberries, raised by cross fertilization in a similar manner; and am looking forward to the result of subsequent experiments, which from the success I have already attained leads me to believe will prove highly satisfactory. Two or three of the varieties obtained, (but one more especially) possess excellent properties of growth, fecundity and flavor, and differ remarkably from any previous one which has come under my observation. * * *

"Throughout the vegetable kingdom, it is found that there is a certain point or degree of ramification more or less in different individual members, removed from the parent stem, previous to the attainment of which, a plant is incapable of putting forth fruit blossoms; the cause of this it were difficult to explain satisfactorily. Having ascertained the numerical amount of this requisite degree of ramification in conjunction with a knowledge of the habits of the plants, as to the number of successive shoots it protrudes in the course of the year, we may form a pretty accurate estimate

of the length of time required before it shall attain to a fruit bearing state.

"Thus, other circumstances remaining the same, the oak, did it not send forth two shoots, the one in spring, the other in autumn, would be double the long period it now is, ere it began to produce acorns. The exact number, however, cannot be ascertained, since all traces by which they might be computed are in the older portions of the wood entirely lost. It is by earlier inducing this degree in the melon, which is generally the second from the main stem, that the pruning or stopping is effective towards the accelerating of the emission of fruit blossoms.

"In the apple the twelfth, and the pear the eighteenth, are about the minimum number of degrees of ramification distant from the parent stem that are required ere flowers are put forth; that period, however, is often protracted. In computing these numbers, a shoot succeeding after a quiescent period, whether still projected in a line with the older wood, or at an angle from it, is equally considered as a distinct branch; there is indeed a knot at the junction, as much of the one as the other; and it is the number of these knots, by retarding the flow, or causing the accumulation of the sap, which would appear to bear some part in effecting a fruitful state. From these circumstances the inference to be drawn is, that if we can cause the formation of three or four successive shoots in the course of the year instead of one, or at the most two (as would be the case were the tree left to its natural growth,) that we shall thereby anticipate by a half or two thirds, the usual period of fructification.

"With this aim then, it will be necessary to maintain the young seedlings by due care and judicious culture in a vigorously growing state, and two or three times, or even oftener, as the circumstances may warrant, nip off or prune back the leading shoot, whereby at each operation a new branch will be protruded, which otherwise would not have been the case, until the succeeding spring. By a continued repetition, however, of these operations an inconvenient number of diverging shoots will also be excited; consequently attention must be paid to regulating their number, by disbudbing the branches accordingly, which will also infuse more vigor into those remaining. It will not be advisable to continue the stopping far into the season, otherwise the young wood will not have time to ripen; and the frosts of winter, by killing the new-formed portions, will counteract the advantage obtained. By duly following this method, the usual period of fructification will be shortened with the apple, to and from the fifth to the seventh year, instead of the twelfth to the twentieth, and the pear in like proportion."

Birds. When the corn-crake (*Ortygometra crex*), is alarmed, it has the instinct in common with some other animals, and especially insects, to feign death. A gentleman had one brought him by his dog; it was dead to all appearance. As it lay on the ground, he turned it over with his foot; he was convinced it was dead. Standing by, however, some time, in silence, he suddenly saw it open one eye. He then took it up, its head fell, its legs hung down, it appeared again totally dead. He then put it into his pocket, and before very long felt it all alive and struggling to escape; he took it out, it was lifeless as before. He then laid it on the ground, and retired to some distance

in about five minutes it warily raised its head, looked round and decamped at full speed.—*Field Nat. Mag.*

Extracts from "Transactions of the Essex Agricultural Society for 1832."

EXACT AND EXPERIMENTAL AGRICULTURE.

My friends, the Farmers of Essex County, will not be offended if I presume to urge them upon one or two points, which I deem of great importance to their agricultural improvements; and they will pardon a freedom and earnestness which they know springs wholly from an honest pride in the honor and a strong desire for the success of their intelligent and enterprising association. Though removed from their immediate vicinity, I am not the less interested in whatever concerns a county, endeared as the residence of my remote ancestors, who among the earliest emigrants made it their resting place, and, with their descendants for years, participated in his privileges and blessings.

The first matter which I suggest to you is exactness in your agriculture. The neglect of this is almost universal, and to its great disgrace may be said to be characteristic of the farming profession. In my intimate intercourse with farmers for years, nothing has been more remarkable, and nothing in many cases more mortifying and provoking, than this want of exactness. They measure nothing, they weigh nothing. It is all guess work with them in every thing. Ask them how much land they till or mow?—they do not know. How much corn, rye, oats, barley, how many potatoes they raised?—they did not measure them. How much hay they mowed?—they guess about so many loads. How much their corn or their potatoes yielded?—why, they judged about so and so; but this judgment is altogether the merest guess work. How much manure they put upon an acre?—why, they mean to put on, commonly, for there are always qualifications enough to save their veracity, about six, or eight, or ten loads, as the case may be; but what they call a load is with themselves, and must be with others, matter of pure conjecture. How much seed they sow to an acre?—why, as near as they can guess, about so much. How much will a favorite cow yield?—why, she gives over a pailful; but what is the size of the pail, whether six, or eight, or ten quarts, or whether wine quarts or beer quarts, which makes a difference of at least one fifth; or how much over, whether one quart or four quarts, are points, which it never occurs to them are important to be defined, or at least pretty exactly approximated, before they presume to demand the confidence of others, or indeed to place confidence themselves in their own statements.

Now I submit to you, my brother farmers, whether this is not an unvarnished statement of facts. Ought it to be so? Is such looseness or neglect admissible in any other of the business professions?

But what, you will ask, is the advantage of such exactness? We answer, very great. There is a satisfaction in knowing what we do. If we do not, in fact, do so well as we imagine, let us not go on deceiving ourselves, but ascertain the occasions of the failure. If we in fact do better than we imagine, let us enjoy the pleasure of conscious improvement, and let it furnish a stimulus to greater efforts.

Exactness is important in the next place, in order that a man should compare the value of his crops with the expenses of cultivation; and of each crop with its particular expense; that he may determine how far he is a gainer or a loser by his operations; and in what respect one crop may

have the advantage over another; that he may determine which will best repay his care and labor. But he can never do this, and he is liable to the grossest mistakes both in judgment and practice, without exact observation and measurement.

Exactness is important in the next place to the proper disposal of his crops. How can a farmer well calculate what he shall do with his crops, unless he first ascertains what he has? If he overrates them, he is liable to overstock his farm, and either be compelled to pinch his cattle, by which in the end he is sure to lose, or to purchase fodder, which few men can afford to do; or if he underrates them, not keep stock enough, and with the feeling of abundance be very likely to use his produce prodigally and wastefully, and so fail of the advantages within his reach. Exactness is in the next place important to a man's character and usefulness. Agricultural operations approach so nearly to what may be called a creative power, that no class of people are more liable to have the organ of self-esteem powerfully excited than the farmers. Few men therefore are more disposed to boast of what they have done, and especially how much they have done. Some of their statements are so extravagant that they are made at the expense of all respect either for their judgment, or knowledge, or veracity. The fact is they do not mean to impose on others, but they deceive themselves. It is all guess work with them. The effects of such misstatements are often very bad; and equally pernicious whether the result of mistake or design. The inexperienced and confiding are led into gross miscalculations by them. Now, a respectable man ought to have so much regard to his own honor as that, when he makes a statement he may be sure it is founded in strict truth; but of this he never can be sure, unless he is in the habit of exact calculation and measurement; and no certain progress can be made in the science of agriculture without this exactness. Agriculture must be considered as one of the exact sciences; and we shall never know whether our progress in it is forward or retrograde, until we have done with guessing. I have myself been so frequently and egregiously deceived by the misstatements of men who certainly did not mean to deceive, that I have long since determined to believe no statement which a man has not verified by actual and exact observation, and then I am as willing to give my confidence as any man. I could give some of the instances to which I refer, but some of my friends who are accustomed to draw a long bow, would recognize the likeness, and I should be sorry to give them as much pain as they have occasioned me disappointment.

But, you say, it is troublesome to be so exact. The trouble is not great where the habit is once formed; and is very much more than compensated by the satisfaction experienced in doing it. Land can be measured with considerable correctness without the trouble of a surveyor's instruments. The time occupied in planting, cultivating and gathering a crop, can easily be taken account of. The manure cart can be measured, and then an account kept of the number of loads carried out. The seed can easily be measured. All vegetable crops, all grain crops are very quickly measured. Hay can easily be estimated in the cock or in the load, and the number of loads determined; or the size of a mow ascertained, and the amount of hay contained in it very nearly calculated. Then again, the amount of food consumed by different

animals for a week at a time, at different seasons can be ascertained with very little trouble; and a calculation of the whole amount required for them be made from these premises. The quality of the milk of a cow can easily be decided by setting a portion of it for cream in a glass vessel, and comparing it with others in the same way and under the same circumstances; or the milk of a particular animal can be placed by itself for a period of time, and her actual produce determined. All dairy produce is easily ascertained. The debit and credit sides of your sheepfold too, and of your pig-sty, where let me tell you exactness is especially important, are easily kept. All these things ought to be done; and, I say again, that the satisfaction and advantages of doing these would greatly overbalance the trouble and care. Ask an intelligent and enterprising manufacturer about his concerns. He can tell you, if he deserves that character, how much power of water he has, even to an inch; how many spindles he can carry; how many pounds of wool or cotton he can work up; how much fuel, how much oil, how much dye-stuff he requires; how many pounds of wool or of cotton are needed to make a yard of cloth of a certain degree of firmness; how much of human labor he can employ to advantage; and at what rate exactly he can afford to sell his cloth in order to get a living profit. Now is there any reason in the world why a farmer should not be, as far as possible, as exact and calculating in his concerns as the manufacturer? would he not find an equal advantage in it? and is not the want of this exactness and care one of the great reasons, why farmers in too many cases find their farms either an unprofitable or a losing concern, and in point of improvement are just where their fathers were a century ago? Keep a journal therefore; a diary. Keep an account of every field and every crop. Ascertain what it costs; what it comes to; what you have done for it, and what you do with it. Keep an account in some form with every domestic animal on your place. See whether they pay, or how they can be made to pay for their living; whether you keep them for profit or pleasure. Do not be ashamed of mistakes and false judgments and miscalculations, unless you voluntarily run into them a second and a third time; because no human judgment is infallible, and the wisest are ever liable to err; and in the first place take care not to impose upon yourself, and in the next place, when you undertake to tell your neighbors what you have done, be sure you are able to speak the truth, the whole truth, and nothing but the truth.

Next to exactness is another matter intimately connected with it and of like importance to to an improving agriculture, that of making ing experiments. You are too intelligent to indulge in the senseless clamor about agricultural experiments and experimental farmers. You know that in agriculture all knowledge is the result of experiment, and those are esteemed the best farmers, who have made the most experiments, that is who have had the most experience and the longest practice. But perhaps you will say, let the rich make experiments, we have not the means. This is not so; and the farmers of moderate circumstances, and who work in their own fields, are the very persons to make the experiments, because they are better able to watch the result; and, as they cannot afford to lose and are most concerned to make their agriculture profitable, will feel the

strongest interest in the progress of such experiments. Now very extensive or expensive experiments are not what we recommend to farmers of small means; but small experiments are perfectly within their reach, and the instruction to be gained from them on a small scale may be equally valuable and decisive as from those on a large scale. The effect of lime upon your farms, or upon the different soils to be found in different parts of them; applied to corn or wheat, to potatoes, to grass; used in its air-slacked or unslacked state; how to be applied; when to be applied;—all these are very important inquiries, and may be as easily ascertained by the use of a single cask, which may cost you a dollar, as by the use of fifty; and in any event you are certain that the lime is not wholly lost. So too with gypsum and ashes. Some of the most important points in regard to the application of these powerful manures remain to be settled by experiments. The result of such experiments may be of great importance to you; how they are to be applied; in what quantity, at what season; in what form, to what crops; under what circumstances they lose their efficacy; what kinds of plaster are to be chosen, the dark or the pink colored; how ashes are to be applied, whether leached or unleached; the comparative value of wood ashes, and of peat-ashes, with which your county abounds; all these important points can be determined only by experiment; and these experiments on such a scale as to decide them may be made by the smallest farmers and at almost no expense. So too as to the application of other manures; by the most simple experiments and without cost you can decide for yourselves the long mooted questions whether manures are best applied in a green or a rotten state, in the hill or spread; and buried by the plough, or scattered on the surface and barely covered with a harrow.

So likewise in regard to your crops:—you can as well ascertain on a quarter of an acre as on a quarter of a hundred, whether your soil will bear wheat or not, or by the application of lime or soap's waste may or may not be made to bear it; whether the autumn or the spring wheat is best for you; whether your corn or potato crops were better planted in hills or in drills, and at what distances; whether your grass seed may better be sown in the fall or the spring, by itself or with other crops; and whether after a fair trial of the expense and value of the produce you would find it for your advantage to cultivate for the feeding of your stock large quantities of vegetables, such as potatoes, carrots, or turnips; or to confine yourself to Indian corn and grass. These experiments would lead, if carefully conducted, to most valuable results, and for all practical purposes are as much within the power of the farmer in moderate as the farmer in affluent circumstances.

Next, in regard to your domestic animals, do not be offended if I ask you, how many of you can tell me, how much hay and provender it requires ordinarily to keep a horse? how much a yoke of medium sized oxen, worked or not worked? how much a common milch cow? how much your yearling and two year old heifers and steers? and how near their labor, their produce, or their growth comes towards defraying their cost? These animals are kept at great expense beyond a question. The keeping of them a part of the year is not necessary for their labor to all of you, nor for their manure to some of you, who can procure this article in abundance either from

the sea shore or from the neighboring livery stables. These then are most important points, which can only be decided by actual experiment; and such experiments require nothing more than a little trouble or attention, in measuring their food for a certain time. Very few of you would I believe be able to answer these questions with any thing like certainty. The amount of hay, for example, required for wintering a cow is estimated by different individuals at from one and a quarter tons to two tons and a quarter. This, where hay is a cash article, is a very important difference; and though there will be differences in the size and appetites of different animals, yet most certainly we might more nearly than that approach the determination of the quantity. So too with respect to feeding of oxen and horses, not only as to quantity but the kinds of feed which may be most profitably applied, corn fodder, English hay, salt hay, corn, meal, oats, food cooked or uncooked, many queries arise, which can only be settled by experiments, careful experiments; and may be settled by experiments which would cost nothing.

In regard likewise to the keeping of swine, every farmer who keeps one may soon settle for himself by actual experiment, the often discussed question of their profit or loss; and other points of equal importance relating to the kinds of food, which may be most profitably, if profitably at all, be given them.

These and such experiments as these I recommend most earnestly and most respectfully to the Essex farmers to make and to repeat and to report. The results of them and the faithful and exact communication of those results to the public through the Society will be of the greatest benefit both to individuals and to the community. In my opinion the Society could not better appropriate some portion of their funds than in the encouragement of such experiments by giving, where they are well conducted and fully detailed, whether successful or not, such pecuniary gratuities to those who conduct them, as in their judgment they may merit; and as shall stimulate them to further inquiries, though such objects of premium are not, from the necessity of the case, previously promised in their publications.

Facts in agriculture are the instructors, which are most needed. The advances of the science have been necessarily slow; but who can doubt that there are yet many more truths to be discovered, other mysteries in nature to be solved; and much more light to break forth on a subject so essentially connected with human subsistence and comfort and the general welfare. He who assists to settle the most simple truth, and to solve the least of these and other controverted points, is to be deemed a public benefactor. He who brings but a single pebble to the heap, may feel a just claim to his share in the honor of contributing to the substantial foundation on which the subsistence of animal life, the exercise of all intellectual and moral energy, and the improvements and comforts of human society primarily and mainly depend;—agriculture, the mother of all the arts and the basis of all national prosperity.

HENRY COLMAN.

From Goodsell's Farmer.

GRAPES.

Summer Management of the Vine.—We are often called upon to direct as to the management of vines, during the summer, and of course con-

clude that an article, on this part of Horticulture will be acceptable. In the first place, the ground about the roots of vines, should be kept loose, and free from weeds.—The vines should be well secured to the trellis, by bark or otherwise, and so spread as to admit the sun, and a free circulation of air. The greatest danger to be apprehended, is from the vines becoming too thick, to prevent which such shoots as do not show fruit, should be cut away, and this may be done at any time during the summer months. The practice of cutting off the points of the shoots and leaves from bearing branches is uncalled for in this country during summer and even at fall pruning.—The shoots of the American varieties of Grapes, may be left nearly their whole length, or so many of them as can be accommodated with room upon the trellis.

It is a bad practice, to train grape vines over the top of arbors, or arched trellis, as the fruit will hang below the vines, and is apt to be excluded from the rays of the sun, in which case they do not ripen as well as when exposed to more light.

In training European varieties it is desirable to have a few shoots from near the root of each vine trained particularly for producing bearing wood for the next season. These should have the full rays of the sun to render the wood firm that it may better endure the frost of winter.—Should the mildew appear upon the vines, let them be washed with lime water or dusted with fresh slacked lime as often as once each week until it ceases to spread upon the vines.

Peas and Beans. Most people are fond of peas and beans during the summer months, but do not appear to be aware that they may be kept through the winter equally as palatable as when first picked from their stems. For this purpose let them be picked and shelled for present use and put into a weak solution of sugar, and boiled for a short time; then put them into an oven moderately warm, where they should remain until dry; let them be put into bottles and corked tight and kept for use in this manner, and with little trouble fine dishes may be served up during mid-winter, when they will be found to contribute much to the variety of the table.—*lb.*

A REMEDY TO STOP BLOOD.

THE efficacy of *soot* in stopping blood proceeding from a fresh wound, was lately tested and proved beyond a doubt, in the case of Nathan Cornish, near Newark, New Castle County, who while engaged in making fence, by a misstroke of the axe cut his leg badly to the bone, which bled profusely. Not being aware at first, of the extent of the injury he had sustained, he continued at work, till perceiving the blood running very freely, he pulled off his boot and was alarmed at finding it drenched with blood. He immediately started for home, the blood from his leg continued to increase, and after his arrival, proceeded to try various means for stopping it without effect. After trying almost every remedy without success, and despairing of stopping the blood, with the loss of which his strength was fast wasting away—*soot* was applied, and to the surprise of every one the bleeding was stopped almost instantly. And what is still more singular the pain which was very severe almost as soon abated, and he is now in a fair way to recover.

Snow Storm. There was a violent snow storm on the White Hills on the 17th of June.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 14, 1833.

Brighton Cattle Show. The Cattle Show, Exhibition of Manufactures, Ploughing Match, &c. of the Massachusetts Society for the Promotion of Agriculture, will take place at Brighton on Wednesday 16th October 1833, commencing at 9 o'clock, A. M.

Remarks on the Culture of Wheat. The cause or causes of the usual failure of wheat crops in New England, especially in lands which have been some years under cultivation, have been topics of discussion in this and other agricultural papers, without much coincidence of opinion. We have long since expressed our belief that lime was an indispensable substance without which wheat cannot be brought to perfection; and will here assign some of the reasons for our belief.

Mr. John Young, of Nova Scotia, a very ingenious writer, and a practical as well as scientific agriculturist, in an able work entitled "*Letters of Agricola*" says "It is fact that lime is indispensable to the production of superior wheat crops. The rye lands of Hertfordshire, [Eng.] which were reported by Dr. Beale, in the year 1636, as incapable of producing wheat, have been so much fertilized by the subsequent introduction of this fossil manure as to be successfully applied to the growth of that and every other grain. This and similar effects may be referable in part to the subserviency of this earth to the more perfect formation of the vegetable structure; for we know that birds, if confined to a cage, will lay eggs with soft shells. So wheat may labor under some analogous imperfection, unless the carbonate of lime comes within reach of its roots.

In "*Anderson's Recreations*," a work highly esteemed in Europe, the following passage occurs:

"I had a field of good arable land, a mellow loam in Aberdeenshire, which had been long in culture, often dressed with animal and vegetable manures, and was of course endowed with a considerable degree of fertility; but being full of weeds, it was subjected to a thorough summer fallow in order to get rid of these and bring it to proper tilth in other respects; and as lime is found to be an active manure in that district, it had a moderate dressing of lime put upon it, and some dung at the same time. The whole field was sown with wheat at the proper season, which sprang up equally thick on every part of it. For some time no difference was perceivable in the appearance of the crop over the whole; by and bye it was observed that the wheat on a small portion of the field, which by accident had not had any lime put upon it, became pale and sickly. While the crop in other parts of the field advanced luxuriantly, it dwindled in this particular patch more and more, till towards the beginning of May, the whole had died quite out, and not one stalk of wheat was to be found upon it, though the weeds in consequence of the richness of the soil at that time grew there with extreme luxuriance. Perhaps the proportion of calcareous matter did not in this case amount to more than one thousandth part of the whole, yet the qualities of this soil were thereby totally altered, inasmuch that though before the application of that dressing, the soil was incapable of producing wheat at all, it was found at all times after that period well adapted for the raising of

that crop. Nature has formed many soils with a similar proportion of calcareous matter blended imperceptibly in them over large districts of land."

By this article it appears that small quantities of lime will produce a permanently beneficial effect, if applied to land which is destitute of that kind of earth. A quantity equal to one thousandth part of the whole mould within reach of the roots of the plants commonly cultivated, would not be a dear dressing even in Massachusetts; yet that small quantity was found by Dr. Anderson to be sufficient to effect such a change in the constitution of a soil as to enable it to produce good wheat, though previous to its application it would not ripen a single stalk. Larger quantities, however, would probably prove beneficial. English farmers apply from 60 to 400 bushels to the acre, as it measures when fresh from the kiln.

Dr. Darwin, in *Phytologia*, states that "the wheat produced after land has been much limed, is believed to be thinner skinned, and to produce more good meal than any other wheat, and to make better bread." Loudon observes, "The manures best calculated for wheat are animal matters and lime. The former has a direct influence in supplying that essential constituent to wheaten flour, gluten; and the latter azote and lime, both actually found in the straw of wheat. At all events it is certain that wheat will not thrive in any soil that does not contain lime. In this Sir H. Davy, Chaptal, Professor Thaer and Grisenthwaite, fully agree."

There are other crops besides that of wheat to which lime would seem to be indispensable. *Dickson's Farmer's Companion* states, that "it is observed, that the common pea, whether white or gray, cannot be reared to perfection in any field which has not been either naturally or artificially impregnated with some calcareous matter. But it is remarkable, that a soil that could scarcely have brought one pea to perfection, although richly manured with dung, from their running too much to haulm, and after blossoming dying away without becoming ripe, if it has had lime applied upon it, is capable, when properly prepared in other respects, of producing plentiful crops of peas ever afterwards."

It may, perhaps, be asked, why new lands, or lands recently cleared from their native woods, will at first produce good crops of wheat, but after having been cultivated for some years, though made rich with barn yard manure, will lose its power of producing that grain. To this it may be answered that, perhaps, the soil originally contained small quantities of lime, which became exhausted by tillage; and, perhaps, the ashes, which were left in clearing might, by yielding potash, present a substitute for lime.

From the preceding we think it apparent, that lime, or some other alkali, is indispensable for the culture of wheat; but the use of animal manure for wheat crops involves another question, which we hope to discuss hereafter.

To destroy Insects in Fruit Trees. Two gallons of boiling water poured on two ounces of tobacco and three or four handfuls of the tender shoots of elder. The trees sprinkled with a small hearth brush for two or three weeks will effectually destroy insects. Elder-water frequently sprinkled on honey-suckles and roses, prevents the insects

lodging upon them. The above decoction may be made of any strength as it is perfectly innocent to the tree.—*Horticultural Register*.

PRESERVING FRUITS FROM BEES.

MR. FESSENDEN,—What is the best mode of destroying Bees that attack Fruit, or what method for preventing them? Is there any remedy for these depredators?

J. H.

By the Editor.—We have never been before apprised of Bees becoming to any amount injurious to Fruits, and are sorry to learn that they have been guilty of trespass of that description. Mr. Forsyth recommends the following as a preservative against wasps, which, perhaps, might prove of equal efficacy against Bees:

"Several phials or small bottles, should be prepared towards the time when the wasps appear. These vessels are to be filled half, or three parts full, with a mixture consisting of the lees of beer or wine, and the sweepings of sugar, or the dregs of molasses: next they must be suspended by yellow pack-thread, on nails driven into the different parts of the garden walls, so as to reach nearly to the bottom. When the bottles are filled with insects, the liquor must be poured into another vessel, and the wasps crushed on the ground. Should the weather prove hot, so that these marauders become very numerous, and will not enter the glasses exposed for their reception, touch them on the back with a little oil, and they will immediately fall down, and perish, the lateral pores through which they breathe being closed."

If, however, bees are the transgressors, it will be necessary to decide which it were better to sustain, the injury done to your fruit, or the loss of the bees which do the mischief, before you commence offensive operations.

ITEMS OF INTELLIGENCE.

We now have beautiful weather for haying and harvesting. Our wheatfields are like to turn out more than an average crop—grass is good, and corn which for some time looked very unpromising is now coming forward finely.—*Fredonia Censor*.

Revolutionary Soldiers. The whole number of applications for the benefit of the new Pension Act, will exceed twenty-five thousand, which added to those who are embraced in the provisions of former acts, constitute a total of more than thirty thousand survivors of the army of the Revolution. Of this number more than six hundred are living in the county of Worcester. There are besides many who served a shorter term than is requisite to receive a pension.—*Worcester Spy*.

Large Mustard. A neighbor of mine has a stalk of mustard that measures 11 feet $3\frac{1}{2}$ inches in height, one limb of it measures 8 feet 10 inches; you may rely on the accuracy of the measurement. The stalk was growing when measured. The seed is supposed to have come with beans or some other seed of that kind—at all events, it is an accidental growth. The seeds will be saved; I am promised a part, of which you shall receive a portion.—*Hindes Co. Miss. June 28, 1833*.

One of the most extraordinary occurrences of modern times, was lately witnessed on the line of the Chesapeake and Delaware Canal. A Mr. Whelden who left Easton, Pa. on the 27th June, 1832, was attacked on the 15th Aug. 3 o'clock, P. M.; and at 7, the next morning was to all appearance dead. In an hour after, he was placed in a coffin, and taken to the burial place. Here, as the coffin lay beside the grave, a deep moaning was heard, and immediate suspicion of the fact inducing the

people to remove the coffin lid, Whelden exhibited signs of life. He was removed and is now in the borough of Easton, alive and well.—*Gazette*.

The Weevil. The Ballston Spa Gazette in the State of New York, mentions that the weevil has commenced his destructive operations. On wheat fields of 60 acres, where there was every prospect of an abundant yield—there will not be sufficient to pay the farmer for harvesting. It is said, that sowing lime on the heads of wheat when the dew is on, will drive the weevil from the field.

The Edgefield Carolinian of the 27th ult. says, "The wheat crops in this district have been almost totally destroyed by the rust."

More Gooseberries. On Saturday, Col. Mosely brought in, for our inspection, a lot of gooseberries—the stated number nine—which, upon comparison with those, of which we have already spoken, appeared to be a *little* larger. One of them measured four inches within a hair or two. They grew in the garden of Miss Mary Greenleaf, in Union street.

By the way, we are obliged to our friends for raising a newspaper paragraph for us in these dull times—a paragraph interesting enough, although it grew on a gooseberry bush. Our main object however is to stimulate the Horticultural Society. The members of that association have it in their power to bring about a new era in gardening here. For our part, we see no manner of reason, why we cannot get up horticultural exhibitions here, which shall vie with those in Boston. There is leisure, space and (there should be) spirit and intelligence enough to do it. Let us have it done then.—*Newburyport Herald*.

BOSTON FANEUIL MARKET, Aug. 14, 1833.

Vegetables. Early Potatoes, 50 to 60 cts per bushel; Peas, 1 25 cts per bus; String Beans, 75 cts. per bush.; Squashes, 12 1/2 cts pr doz; Cucumbers, 12 1/2 pr doz; Turnips, Onions, Beets and Carrots, 6 1/2 cts pr bunch; Green Corn, 12 1/2 cts pr doz; Shell Beans, 10 cts pr qt; Tomatoes, 12 1-2 cts per doz.

Fruit. Pears, \$2 per bushel; Apples, from \$1.00 to \$1.50, according to quality; Whortleberries, 6 cts pr qt; Blackberries, 12 1/2 pr box; Gooseberries, none; Peaches, 2s 3d per doz; Apricots, 3s pr doz.

BOOKS.

Books upon Agriculture, Horticulture, and Rural Economy, Published and for sale by Geo. C. Barrett, N. E. Farmer Office, 52 North Market st. Wholesale and Retail Booksellers supplied on very liberal terms, and their orders solicited.
aug 14

NEW ENGLAND FARMER'S ALMANAC FOR 1834.

NOW in Press, and will soon be published the *New England Farmer's Almanac for 1834*, by THOS. G. FESSENDEN, Editor of the New England Farmer, and will be for sale Wholesale and Retail, by GEO. C. BARRETT, at the N. E. Farmer office. Dealers supplied on very low terms, and orders are solicited early.

The flattering reception and extensive circulation of the six first numbers have induced the publishers to render the 7th No. as useful and interesting as possible. tf a 14

CLOVER SEED.

4000 lbs. Northern Clover Seed.—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

BULBOUS ROOTS.

JUST received at the New England Seed Store, 51 & 52 North Market street, one Lot fine Bulbous Roots,—containing Tulips, variety, at 12 1-2 each, or \$1 a dozen; Hyacinths, Dutch, very fine sorts, without names; Polyanthus Narcissus, do. do.; Sweet Scented, do. do. with names. Expect next week an invoice of very splendid Hyacinths, Tulips, &c. &c.
aug 14

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one fluked. The dams of the above have given more than 20 qts. of milk a day on grass only.

They are all descended from the famous imported Bulls, Bolivar and Colebels, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer.

optf

GRASS SEEDS,

(for fall sowing.)

FOR sale at the New England Seed Store, 51 and 52 North Market Street.

Clover, (Northern)—Herds Grass—Red Top—White Clover (fine imported)—Lucerne, &c. &c.—Wholesale and Retail.

SEEDS.

(for fall sowing.)

FOR sale at the New England Seed store, connected with N. E. Farmer office 51 & 52 North Market Street.

White Portugal Onion seed—Silver Skin do.—Fall or Prickly Spinach—Black Spanish or Winter Radish—Celery, &c. &c.

SEEDS,

for West Indies, &c.

Merchants, and masters of vessels and others trading to the West Indies, South America, &c. can be furnished with Boxes of seeds assorted and suitable for those markets at \$3 and \$5 per box.

Also, Smaller assortments at \$1 per box.

BROOKS' PATENT SILK SPINNER.

THE public attention is invited to this machine. It is adapted to domestic use, is simple in its construction, occupies a small space, and may be used to advantage by women and children. This machine may be obtained by applying to T. R. NEWELL, at the Agricultural Warehouse, No. 52 North Market street, Boston; or to the Patentee, ADAM BROOKS, SCITUATE, July 22, 1833.

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

PEMBROKE BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butte. Salt. 6600 loaves Table Salt.

Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale.
june 5 CHAS I. CAZENOVE & CO.

GENTLEMAN'S POCKET FARRIER.

For sale at the Farmer Office, showing how to use your Horse on a journey; and what remedies are proper for common accidents which may befall him; by F. Tullnell, Veterinary Surgeon. Price 15 cents.
july 17

COUNTRY SEAT FOR SALE AT AUCTION.

WILL be sold at auction on Monday the 2d day of Sept. next at 4 o'clock P. M. (if not sold previous at private sale), the House, Barn and out Buildings, with about one and a half acres of land attached to the same laid out as a garden well stocked with every description of the choicest kind of fruit trees, all of which are in bearing. The House is two stories high, well furnished, with four rooms on the lower floor besides the kitchen. 9 good chambers, 2 wells of water, good cistern for rain water, the Barn is large and in perfect repair.

This situation is in Dorchester on the road leading from Roxbury to South Boston, three miles from State street, in the immediate neighborhood of the late Gov. Eustis' estate, and adjoining that elegant situation formerly owned by Cornelius Coolidge, Esq. and now owned by Charles Taylor, Esq.—the sale will be on the premises, where the conditions will be made known; the place can be examined any day previous to the sale from 3 to 7 P. M. for further information inquire of Jas. Swett on the premises or at No. 52 India Wharf. epts jy 31

MISCELLANY.

VERSES TO THE SHEARWATER—ON THE MORNING AFTER A STORM AT SEA.

BY RICHARD ALSOP.

WHENCE with morn's first blush of light
Com'st thou thus to greet mine eye,
Whilst the furious storm of night
Hovers yet around the sky?

On the fiery tossing wave,
Calmly cradled dost thou sleep,
When the midnight tempests rave,
Lonely wanderer of the deep?

Or from some rude isle afar,
Castled 'mid the roaring waste,
With the beams of morning's star,
On lightning pinion dost thou haste?

In thy mottled plumage drest,
Light thou skimm'st the ocean o'er,
Sporting round the breaker's crest
Exulting in the tempest's roar.

O'er the vast-rolling watery way
While our trembling bark is born,
And joyful peers the lamp of day,
Lighting up the brow of morn;

As through yon cloud its struggling beams
Around a partial lustre shed,
And mark at fits with golden gleams
The mountain billow's surging head;

Whilst the long lines of foaming white,
At distance o'er the expanse so blue,
As domes and castles spiring bright
Commingle, rise on fancy's view—

From wave to wave swift skimming light,
Now near, and now at distance found,
Thy airy form, in ceaseless flight,
Cheers the lone dreariness around.

Through the vessel's storm-rent sides
When the rushing billows rave;
And with fierce gigantic strides,
Death terrific walks the wave.

Still on hovering pinions near,
Thou pursuest thy sportive way;
Still uncheck'd by aught of fear,
Calmly seek'st thy finny prey.

Far from earth's remotest trace,
What impels thee thus to roam?
What hast thou to mark the place
When thou seek'st thy distant home?

Without star or magnet's aid,
Thou thy faithful course dost keep;
Sportive still, still undismay'd,
Lonely wanderer of the deep!

A DREAM.

AFTER a laborious day's work I retired to rest much fatigued, when the following dream passed through my mind. I thought early one morning, as I was passing through a neighboring village, the first person that I met was one of the village lawyers with a hoe on his shoulder. I accosted him—what Esquire, turn farmer? Yes—every one must be about something for a livelihood—our professional business has almost come to an end. These popular Temperance Societies have ruined our business. Since people have left off drinking rum and getting trusted at the stores we are out of business—when almost every one was in the habit of drinking rum and getting trusted at the stores all they could, we had fine times—three-fourths of the writs and warrants that went from our office

were occasioned by rum. Quarrels, assaults and battery were frequent, which made fine business for we lawyers. The store keeper, after trading a year or two, and trusting every body and every thing that would take rum or goods, of course must fail. After the failure, the notes and books were sure to fall into our hands, from which, if well managed, we could make three or four hundred dollars; but this business I fear is all over, and we shall be obliged to resort to some other business for a support. It is a shame that a profession which has been so useful and honorable, which cost us so much time, money and hard study, should be destroyed by such feeble means as Temperance Societies;—but public opinion is a powerful engine—every thing falls before it, and we shall be forced to submit. He bid me good morning and went on. I wished him success with his hoe.

Who should be the next person I met with but the Doctor, with a manure fork in his hand.—What Doctor, you turned farmer too? Yes, since people have done drinking rum I find but little to do in my professional line, and every one should be about something. When rum was freely used by almost every one, I had full employ—I rode night and day; but now I seldom have a call. I always knew that rum was the cause of three-fourths of the diseases and accidents of mankind, but I confess I had not the boldness to tell them so—neither was it for my interest. When rum was in fashion I had many calls that were capital jobs, such as broken bones, fractured skulls, dislocated shoulders, and bruised faces. Those good days are over with us, and I do not regret it. I have seen enough of human misery, and the greatest portion of human misery has been caused by that poison, rum. I am blessed with a good constitution, and hope I can obtain a living by farming, (which has become an honorable employment) if my professional business fails me. He shouldered his fork and went on cheerfully to his labor. I awoke and lamented that it was a Dream.—*Maine Farmer.*

MAHOMEDANS.

A traveller says, that during his long residence in Malta, and constant course of commercial transactions with the professors of the Mahomedan creed, he never heard of an unpaid debt, or a violated obligation; and that it is a usual mode of traffic in the market towns, throughout Turkey, for the farmers and huxters to leave their fowls, eggs, butter, &c. in baskets with the prices fixed, and to return in the evening in perfect security of finding the article as they left it or the exact price deposited in the place of just so much as had found a purchaser.

FRIENDSHIP.

Beware of those who on a short acquaintance make you a tender of their friendship and seem to place a confidence in you: 'tis ten to one but they deceive and betray you; you may be civil to them, though you do not entrust them. Silly men are apt to solicit your friendship and unbosom themselves upon the first acquaintance; such a friend cannot be worth having, their friendship being as slender as their understanding; and if they proffer their friendship with a design to make a property out of you, they are dangerous acquaintances indeed. Not but the little friendship of the weak may be of some use to you, if you do not return the compliment; and it may not be amiss to seem

to accept *those* of designing men, keeping them as it were, in play, that they may not be open enemies; for their enmity is the next dangerous thing to their friendship. We may certainly hold their vices in abhorrence, without being marked out as their personal enemy. The general rule is to have a real reserve with almost every one, and a seeming reserve with almost no one: for it is very disgusting to seem reserved, and very dangerous not to be so. Few observe the true medium. Many are ridiculously mysterious upon trifles, and many indiscreetly communicative of all they know.

A girl forced by her parents into a disagreeable match with an old man whom she detested, when the clergyman came to that part of the service, where the bride is asked if she consents to take the bridegroom for her husband, said with great simplicity, "Oh dear, no, sir; but you are the first person who has asked my opinion about the matter."

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutain and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

VOL. XII.

BOSTON, WEDNESDAY EVENING, AUGUST 21, 1833.

NO. 6.

N. Y. HORTICULTURAL SOCIETY.

Was read and ordered to be published, the following interesting, and, if its suggestions shall be carried into practice, important letter from Alexander Walsh, Esq. to the Horticultural Society of this city. The enterprising citizens of New York will not let the present opportunity of obtaining a suitable place to consign their departed friends pass unimproved.

LANSINGBURGH, June 10, 1833.

GENTLEMEN,—I have your kind letter of last month, informing me that I have been elected an honorary member of the New York Horticultural Society.

In the objects embraced by your society, with several members of which I have the pleasure of a personal acquaintance, I feel a deep interest, and will gladly contribute whatever may be in my power to promote its views.

Your society is, I believe, the first of its description instituted in the United States. I trust it will continue to maintain a first rank in usefulness: it has certainly at present attached to it, many of the most skilful florists in our country. The numerous benefits it has conferred on the State, its happy influence on the markets of the city of New York, evidenced by the improved quality, the increased supply and extended variety of esculents, including many naturalized exotics, the taste it has inspired for the cultivation of plants, both of the useful and ornamental, with which the *parterres* and grounds of the citizens are now so generally stocked, and so industriously tended by the fairest of florists, the rivalry produced by exhibitions, and premiums, enlisting at once the pride and interest of competitors, the effect of example not confined to the city, but spreading its influence widely into the interior: these surely must be pleasing results of our labors, they command the admiration of foreigners, while on the citizens at home devolves the acceptable duty of casting over your institution the sweet *flowers* of gratitude.—Must not I feel proud in being admitted into an association, with persons thus capable, and thus desirous, to add to the comforts and happiness of the human family. I beg you will convey to the society my high sense of the honor they conferred on me.

The favored territory, comprised within the United States, presents a soil, and is blessed with a climate suitable to perhaps all the varied vegetable productions of our planet. It is supposed there is not an exotic of whatever climate that could not find a congenial soil in some part of our extensive country, and be therein successfully cultivated. The indigenous plants of America have an interesting claim on attention; they exceed in number, in variety, in beauty, and in usefulness, those of the other portions of the globe, and draw hither the naturalists of other countries, who eagerly seek an acquaintance with, and cull largely from them. How enviable our situation! It is doubtless a fact that art, aiding nature, and directed by science, is capable of rendering the state of New York the prettiest spot of what may be made the most beautiful garden of the earth.

The skill and enterprise of our citizens are not

exceeded, perhaps unequalled, by those of any other people: they fearlessly penetrate the forest to its utmost extent, and visit every foreign shore. Through such men, through the government and commercial agents residing abroad, opportunities offer of procuring seeds and plants, to an extent almost infinite, and in value incalculably beneficial. Of the readiness of individual citizens to advance the honor and the interest of their country, there are instances too numerous for detail. Dr. Perrine, U. S. Consul at Campeachy, addressed letters some time ago to the Chairman of the Committee of Congress, on the subject of Horticulture, urging with much force and correctness the establishment of a Nursery at or near Cape Florida, for the purpose of acclimating useful tropical plants. Many of these, or the seeds thereof, might possibly be subsequently transferred to our and other States, and successfully cultivated.—The subject deserves the attentive consideration of the Horticultural Society.

All Europe is filled with admiration at what we have done for literature, not making it the special privilege of the great, but extending it to the humblest resident of the humblest cottage; but we seem, in too great a degree, to have left to others the instruction of the agriculturist: yet the farmer is, and peculiarly so in our land, the main-stay of all that is truly valuable. The same steel that makes his plough, makes also his sword, and this again his plough; he supplies our markets in peace, and repulses our enemy in war; he is literally the bone and sinew of the State; he is the State itself: as a writer justly and forcibly observes, "God has made the breasts of those that labor in the earth his peculiar deposit for substantial virtue; the focus in which he keeps alive the sacred fire, which otherwise might escape from the face of the earth."

The connection of agriculture and horticulture with literary education is a design which is daily becoming popular. The subject has been before the last session of the New York Legislature, on the memorial of the State Agricultural Society.—The principle was favorably received, and reports in accordance were made by committees in each house. The impression was so decided, that no opposition would have been made to a liberal appropriation for the establishment of a State Agricultural and Horticultural School. The memorialists had, however, no design to avail themselves of the crisis, and an intimation was made that they sought for no measure that would not decidedly appear to have the deliberate sanction of the public opinion; the subject of course lay over, but will probably be again before the next ensuing session of the legislature, and is worthy of your patronage.

A very interesting letter of Dr. Pascalis, on the culture of the Mulberry tree, appears among the printed works of your society. I am satisfied that silk of domestic manufacture will, at no very distant day, become the common wear of our citizens, particularly of females. We want the proper reeling machinery; with this, it would, considering its superior durability, not be much more expensive than cotton or linen. I send you a favorable specimen of Massachusetts raw thrown Silk.

The Grape is a native of our country, and it is

easy to add to our assortment, by importations. What but a little application to the subject can prevent our having wine as good and cheap as the French or Portuguese, and raisins are easily manufactured.

It is reasonable to expect that horticulture would, like many other arts, produce more scientific discoveries, under the control of a society, having no selfish view to subserve, than it could under the management of an individual cramped by the necessity of drawing from its profits the means of self support. This position cannot be overthrown by mere instances of some cases operating otherwise. It may also be observed, and with still more force, that societies can do but comparatively little, unless they enter directly into the practical part of that which they would enforce on others. Of this your society seems to have been aware.

An effort was made, a few years ago, by the New York Horticultural Society, to obtain from the Trustees of Columbia College a lease of the Botanic Garden, for the purpose of entering practically into the objects it was laboring to promote. It is unnecessary now to enter into a detail of causes which led to a failure, over which science then wept, but which may in its result be even propitious.

The landscape garden of Mr. Parmentier, in the town of Brooklyn, was full of all promise that taste and skill, enterprise and enthusiasm, could bestow, but it wanted what no individual enterprise can confer—it wanted the essential of permanence. Parmentier died, and the garden, beautiful and useful as it is, but escaped the fate of its enlightened projector. Let death but hurl another dart, and the Parmentier garden may sink into pristine insignificance—the place of the rose, the olive, and the grape, be usurped by the thistle.

The obtaining of the Botanic Garden, or any other ground, on *lease*, would be but a step in advance of the Parmentier Garden. It must be abandoned on the expiration of the lease, unless the leaser would grant a renewal, which no prudent person would rely on. A society having a perpetual succession of members and managers, and laboring on its own fee simple estate, can alone provide for permanence, so far as human institutions can effect that object.

It would appear from publications made under the sanction of your society, that the gentlemen who delivered the Anniversary Addresses were generally under the impression that the society was destined to give to its operations, a wide range in every subject that could, to every reasonable extent, come within its purview. Ornamental Gardening on grounds belonging to the society was the theme of several of them. Doctor Mitchell went further, embracing a considerable catalogue, manuscript records, printed publications, a library, topographical maps, a garden, an herbarium or *hortus siccus*, entomology, manures, botany, schools, &c. Mr. Carter dwells enthusiastically on the indispensableness of "a large public garden, suitable for conducting experiments on a more extensive scale." The extending of ornamental gardening to squares, promenades, public avenues, &c. is not new.—Mr. Carter, and I think others, would apply it to

"the ultimate home of all, church-yards and cemeteries," "converting them into attractive instead of repulsive objects." Dr. Francis recommends the formation of "an experimental farm, with a school for instruction in the various branches of preliminary education and agriculture." You have thus, it appears, the merit of originating principles for others to improve on.

The Massachusetts Horticultural Society, has made a vigorous essay to connect literary education with practical horticulture, in its various branches, and these again with a cemetery for the repose of the dead. The project is in a course of successful experiment. At a distance of about four miles from the city of Boston, at a place now called Mount Auburn, a tract exceeding seventy acres of land has been purchased, at the cost of six thousand dollars, to which were subsequently added fifty acres, with the design to convert it into a garden for the promotion of Horticulture and an ornamental place of sepulchre.

Some just and fascinating descriptions of this place have been published, the beauty of the site, its applicability to the intended purpose, and the many pursuits to which it may be made subservient. The portion intended for a cemetery was laid off in lots of about three hundred square feet.—One hundred of these lots were promptly disposed of at sixty dollars each, making in the aggregate a sum equal to the entire cost of the first purchase of the land. Through this ground and its magnificent growth of forest trees, planted there by nature, and now of lofty and luxuriant growth, avenues and paths have been opened in beautiful eccentricity through its rich vallies, around its hills, and into the recesses of its groves, leading now to the botanic garden, now to the orchard, to the flower border, and to the classic ornamented tombs of the deceased :

"Were I, O God! in churchless lands remaining,
Far from all voice of teachers and divines,
My soul would find, in flowers of thy ordaining,
Priests, Sermons, Shrines."

I could draw your attention more at large to this subject, were I not under the impression that the publications of the day have not escaped your attention; among others a late report of the President of the Massachusetts Horticultural Society, detailing the setting out of several hundred forest, ornamental, and fruit trees. Among the seeds sown, he states having received four hundred and fifty varieties, forwarded to the society from South America, Europe, and Asia. The report says "cemeteries, like that of Mount Auburn, will soon be established in the vicinity of all large cities. A very magnificent one has been commenced near London. At Liverpool and Glasgow, measures have been adopted for emulating the metropolis of Great Britain. In Germany several cemeteries have been projected, and we hear that the citizens of New York are determined to follow these examples."

Whether the Massachusetts Society had information that *private* enterprise was busy at New York, to follow or improve on the Mount Auburn plan, I know not; but I should hold it a great evil, were that the case.

You may possibly have the subject in contemplation, and to that the Massachusetts report has I trust reference. I can only say that it is worthy of your Society, and must highly redound to its credit and fame, should it rescue the noble design from individual cupidity.

The visitation of the city of New York by yellow fever, has probably suggested the first law prohibiting interments within the densely inhabited part of the city. The late visitation by Cholera has suggested the idea of extending the non-interment district. The difficulty of determining where to fix the line, more than any other cause, prevents decision. In fact, the city, destined, as the late Governor Clinton observed, to contain its two millions of inhabitants, grows so fast, it seems as if it would overtake any new cemetery that might be laid out on New York Island, before the same could be enclosed. The unceremonious violations of the homes of the dead by the public authorities of the city have been so frequent, and their repetitions are so much apprehended, that a disposition extensively prevails to withdraw beyond their reach in the selection of burial grounds. It is certain that no site can be found within the city and county of New York, sufficiently extensive for general purposes, such as contemplated at Mount Auburn, even although the immense expense of a purchase did not interfere. For such a site, we must look to Long Island, or the state of New Jersey. The attendance of friends at the funerals of the deceased would seldom extend beyond the church, or the ferry, and would in this way not be very inconvenient. The citizens are liberal, and would feel on such an occasion an unusual interest. It is not improbable that one or perhaps two hundred purchasers of lots, at one hundred dollars each, could be easily obtained.

The proprietors of Mount Auburn have established, in the city of Boston, a vault to receive bodies as a temporary deposit, when bad weather or other circumstances prevent an immediate removal to their final destination. Here funeral processions end, and the bodies are in due time removed therefrom without parade. The distance from the water's edge at New York to the water's edge near the cemetery, presuming that the same will be adjacent to the landing place, cannot be material, whether the same be three, four, or a dozen miles.

The resort of the citizens in times of recreation, to such a retreat, would be most delightful; within it would be no incentive to immorality or excess of any kind; the visitor might select the solitude of the grove, or the society of the virtuous; he would find amusement or instruction in every step, in every tree, in every shrub, in every flower, "each leaf a book," he might converse with the learned living, or commune with the silent dead.

I have far exceeded the limits I proposed to myself, when I sat down to thank the Society for the honor conferred on me. I seek not to direct, am unable to instruct; I have yielded to my own zeal, and must seek in it an apology for the unreasonable length of this letter.

I am, with very great respect, gentlemen, yours,
very sincerely, ALEXANDER WALSH.
JACOB LORILLARD, Esq. President,
BENJ. McVICKAR, M. D. Corres. Sec'y, of the
New York Horticultural Society.

HARVEST.

THE past has been a busy week with the Wheatland Farmers. They have been engaged in their wheatfields and make but slow progress. The crops are heavy and much lodged.—They will not be able to get through cutting this week. Laborers are scarce, good hands get from one dollar to one dollar and a half per day. Those Farmers

that sowed the red chaff bald wheat last fall are the gainers, for it is not as much lodged as the flint wheat; the straw being stiffer it has withstood the winds and rain better, and is likely to yield better than the flint wheat. For several years past the flint wheat has done best, which has induced the farmers to sow it in preference to the red chaff. I sowed but one bushel of red chaff wheat last fall, from which I harvested last week fifty dozen large sheaves. The soil was sandy gravel and had been clover pasture for two years. I ploughed it up in June with a stiff team, harrowed it well in August, cross ploughed it the first week in September, sowed and harrowed in the seed. We have not been troubled with the insect in the least this season. There were some pieces of the Beaver dam or Mud wheat sown with us last fall, which now promises well, the heads are larger and longer than the red chaff or flint wheat but the kernel not as fine as either. Early sown oats are fine and are now fit for cutting. Barley better than average crops and mostly sound.—Field Beet and Potatoes promise abundant crops.

Yours, &c. L. HARMON, Jr.

Wheatland, July 29, 1833.

THE TURNIP FLY.

A board about 18 inches in breadth, and sufficiently long to cover four ridges of turnips, was made to run upon wheels, high enough to allow the board to pass over the turnips without touching the tops of them; the lower side of this board was painted with white paint, which the men provided themselves with, and took into the field, and during the night (at which time I understand the fly is more vigorous and destructive than during the day) the instrument was wheeled from one side of the field to the other. The insects, on being disturbed, of course immediately fly or jump up, and stick to the paint; and I was assured that at the end of every set of ridges, the board was always covered with them. The remedy appears to be a very simple one, but it may nevertheless prove in some measure efficacious. Should that, on further trial, prove to be the case, I shall consider myself very much favored in having been enabled to be the means of its becoming more generally known.—*Doncaster Gazette.*

GAMA GRASS.

To the Editors of the National Intelligencer.

GENTLEMEN: For the information of those who wish to make an experiment on the *Tripsacum Dactyloides*, so fully and favorably mentioned in the National Intelligencer of this morning, under the name of GAMA GRASS, I can inform such, that it is now to be found, growing in abundance on the farm of Mr. R. B. Mason, at the south end of the Potomac Bridge. This plant I discovered several years since, during my botanical rambles, at that place, and then endeavored to draw public attention to it as a valuable fodder, finding that horses ate it in preference to any other food near them. This grass is also valuable in binding together loose blowing sands, and would therefore be of great use on farms bordering on the seacoast and rivers which are washed by heavy rains and floods. A.

August 7, 1833.

[The respectable author of the above has left at this Office a stalk or two of the Grass which he describes, taken from the island referred to.—*Int.*]

LOCUST TREES.

Among the forest trees attempted to be cultivated in this vicinity, is the Locust Tree. It is valued as strong, durable timber, is of rapid growth, and has a rich and beautiful foliage. But the great difficulty in rearing this tree, is the ravages of the insect called the *Borer*. It attacks the tree while young, upon the outside of the bark, penetrates into the trunk and perforates it in every direction. It then is subject to be broken by the wind, and will not remain sound and uninjured but a short time after the worm has insinuated itself into its vitals. A handsome young shade tree, about twenty feet in height, standing in front of the Court House in this town, was broken down by the wind during the shower on Sunday. On examining it, the *Borer* was found to have perforated it in every direction, and one of them was detected in following his villainous pursuits. The appearance of this insect is much like that of a small *ear-wig*, so called, destitute of wings, but liberally supplied with legs and strong teeth. It is remarked, that in groves of locust trees, only those on the outside of it are attacked by the insects, implying that light and heat are necessary to sustain it. A slight covering of some kind, then, upon the outside of the tree while young, might save it from all these ruinous and destructive injuries.—*Northampton Courier*.

DEAFNESS OF THE AGED.

Nothing is more common than to hear old people utter querulous complaints with regard to their increasing deafness; but those who do so are not perhaps aware that this infirmity is the result of an express and wise arrangement of Providence in constructing the human body. The gradual loss of hearing is effected for the best purposes; it being to give ease and quietude to the decline of life, when any noise or sounds from without would but discompose the enfeebled mind, and prevent peaceful meditation. Indeed, the gradual withdrawal of all the senses, and the perceptible decay of the frame, in old age, have been wisely ordained in order to wean the human mind from the concerns and pleasures of the world, and to induce a longing for a more perfect state of existence.

From the Journal of Commerce.

POISONING HORSES.

DEAR SIR:—I saw in your paper of yesterday, an account of some 25 horses having recently died at Utica, under circumstances which led their owners to suspect that they had been poisoned by arsenic. It is on this particular point, that I wish to make a few observations. In the year 1826, an acquaintance of mine, in the country, lost two horses under circumstances strongly calculated to excite the belief that they had been poisoned: and subsequent developments fastened suspicion on an individual in the neighborhood, who had some two or three weeks before, purchased from an Apothecary an ounce and a half of arsenic. With these, and all the lesser facts that could be collected, the case was presented to the Grand Jury, who found a bill of indictment against the suspected individual, who was duly arrested, and gave bail for his appearance at Court. In this stage of the proceedings, his Counsel advised him, after being fully persuaded of his innocence, to procure a horse of no great value, and give that horse as much arsenic as it was supposed these horses had

taken, the experiment to be instituted solely with the view of ascertaining the precise manner in which arsenic would produce death, and not doubting in the least but it would do so. I was one of the three chosen to conduct the experiment. We gave the horse half an ounce of arsenic—10 hours after we gave him another quarter of an ounce—and 2 hours after we gave another quarter of an ounce, and so continued, till we had given the animal one ounce and a half without producing in the horse the slightest inconvenience. Two weeks afterwards I tried the same experiment on another horse, and with arsenic procured at another place, given in the same quantities, and with precisely the same result. It is proper to remark that this last experiment was instituted at the request of the gentleman whose horses had died, and it was witnessed by him and at least 20 of his friends, and the result was so entirely satisfactory, that he immediately withdrew all proceedings against the person he had before suspected.—I offer these facts as evidence, that the commonly received opinion, that arsenic is so convenient a poison with which to destroy horses, has no foundation in fact. I am yours, &c. K—.

New-York, August 9th.

RECLAIMING PEAT MEADOW.

To the Editor of the N. E. Farmer.

DEAR SIR, I have just come out of my peat-meadows; and, having made much progress since the dry weather commenced, I wish to call the attention of your readers to the subject of their culture; for the more I prove these lands, the more fully am I convinced of the value of them, when they can be drained and reclaimed. I have one piece which was burned over five years since, and has had but one coat of compost put on it, that produced fifty four hundred of hay to the acre this season of clear clover, herdsgrass and red top, which is worth this year \$15 per ton, which is forty dollars and fifty cents per acre, clear profit; for the second crop will more than pay for getting the hay.

My plan is to reclaim them, to pare and burn the land, then harrow and sow the grass seed, and roll it down with a heavy roller. This operation is performed very easily. With my Paring Plough I can pare an acre in a day, and when the weather is as dry as it is now, it will be dry enough to burn in two or three days. The whole operation can be performed for from twelve to fifteen dollars, and the first crop will more than double pay.

Yours in haste, BENJAMIN WHEELER.

Frammingham, Aug. 14, 1833.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

Saturday, Aug. 17th, 1833.

S. Walker, Roxbury, Dahlias—Le Brilliant, Dennisii, Hall's Mogul, Colvell's Perfecta, Romulus.

Thomas Mason, Charlestown Vineyard, varieties of Dahlias, Carnations, with other kinds of flowers.

E. Putnam, Salem, Dahlias, 50 varieties—Pulen, Clustered Purple, Young's Black Purple, Iron Red Globe, Crimson Globe, Star of Brunswick, Lord Lyndhurst, Queen of Yellows, Montpelier, Dennisia, Young's Aurora, Seraphia, Young's Prosperie, Young's Pauline, Barrett's Susanna, Prince's Transcendent, Large Pink Anemone, Brown Anemone, Antonio, Queen of Naples, Douglas's Augustus,

Queen of August, Early Profuse, Imperiosa, Early Blood Red Anemone, Crinson Turban, Dwarf Lilac, Countess of Liverpool, Purple Prince, Painted Lady Anemone, Large Scarlet Anemone, Straw and Purple, Black Prince, Washington Black, Anemone flore, Small Crimson Anemone, Grand Monarch, Countess Plater, Theodore, Profuse Lake, Kentish Hero, French White, Grandeur Superb, Abundant Maroon, Royal Sceptre, Panoply, Sol, Miss Hester, Romulus, Crafts' Maroon.

John A. Kenrick, Newton, Bignonia grandiflora, &c.

Messrs. Winship, variety.

Per order of the Committee,

JONA. WINSHIP.

EXHIBITION OF FRUIT.

Apples. By Samuel Downer, Esq. Dorchester, River Apple, large and handsome; Williams' Favorite, Virginian and Red and Yellow Siberian Crab. By S. G. Perkins and H. A. S. Dearborn, Esqs. the Transparent Apple of the Crimea (Russia), a large white Apple now in eating, flesh white, juicy, tender and sprightly. By John Heard, Jr. Esq. Sopsavine, and a small Apple, name unknown, color vermilion and white, beautiful and fine flavor.

Pears. By S. G. Perkins, Esq. St. Ghelien Pear, of fine flavor. S. Downer, Esq. small French Pear, name unknown. By Samuel Hastings, Esq. Boston, a fine specimen of the Early Rousselet, pear known by the name of the latten, or Catherine pear (not the Catherine or Summer Beauty of the pomologist.) John Heard, Jr. Esq. Windsor pear, and a large handsome pear, and a pear past the time for eating, names unknown. By a gentleman from Harvard, a fine specimen of the Windsors. The same from M. P. Wilder, Esq. Dorchester, and Howland Cowing, Jr. Roxbury. By S. Pond, Cambridgeport, Early Crawford pear. By M. P. Wilder, Dorchester, a fine specimen of the Double Eyed pear, resembling in shape and color the Jargonelle, of good flavor. By Martin Brimmer, Esq. Boston, a good pear, name unknown.

Plums. By R. Manning, Salem, Cherry Plum of Cox, No. 1, handsome and of fine flavor. By A. Brimmer, Esq. Boston, White Gage. By Mr. C. Cowing, Roxbury Green and Prince's Gage. S. Pond, Cambridgeport, Pond's Purple plum. By M. P. Wilder, Dorchester, a handsome blue plum. By S. Downer, Esq. Damson, Drap d'Or, and Bingham plum.

Apricots. By Mr. Joshua Child, Boston, a seedling from his garden, of good flavor and large size, with some of the nuts for distribution, to be known as Child's Seedling Apricot. By Edward Cruft, Esq. Boston, a seedling, raised by himself in his garden, Boston; the committee were full in their commendation of this fruit; it is large, and possessing all the richness, flavor and abundance of juice, seldom if ever surpassed—even in the union of the plum and peach of the most approved sorts: to be known as Cruft's Late Seedling Apricot, as this gentleman has an excellent early seedling, known as Cruft's Early Seedling.

Peaches. By C. Cowing, Roxbury, the Early Ann.

Grapes. By Mr. Thomas Mason, Charlestown Vineyard, four branches of the White Frontenac, large and fine flavored.

Per order of the Committee,

BENJ. V. FRENCH.

Extracts from "Transactions of the Essex Agricultural Society for 1832."

PAUL KENT'S STATEMENTS.

Gentlemen,

I OFFER for your inspection the following statements, being the result of experiment on several kinds of potatoes and the best method of cultivation, for three successive years.

In 1830, I planted one-third of an acre of stiff loam with potatoes; the year previous it was manured well and produced a good crop of onions. I put on no manure in 1830. After ploughing and harrowing the ground, I furrowed it both ways, so as to have five rows to a rod each way, giving 25 hills on a rod of land. I was very exact in laying out the ground. The 27th of May I planted it with seven different kinds of potatoes—1. the Chenango; 2. a round white potato which I have cultivated for ten years; 3. a potato raised by Mr. Burnham from the seed a few years since; 4. a potato brought from the eastward that was called the rareripe potato. I have never heard any names given to the other three kinds, nor is it important that they should have any, for they are worthless.

The second day of October I dug the whole piece and measured them accurately. No. 1 produced $2\frac{1}{2}$ bushels to the rod, and is a very good potato, but not very sightly. No. 2 produced $2\frac{3}{4}$ bushels to the rod, a round white potato, very saleable for shipping, but not quite equal to No. 1 for eating. No. 3 produced 2 bushels to the rod, about equal in quality to No. 2. No. 4, 3 bushels to the rod, a fair potato, but inferior to either of the other kinds for eating.

In 1831 I planted a hundred rods of land with potatoes. The soil was a light loam; the condition as it respects manure, crop, ploughing and harrowing, the same as in 1830. I planted it on the 16th of May with the several kinds from No. 1 to No. 4 of the previous year's experiment, putting 40 hills on the square rod. On the 15th of October I gathered them. Numbers 1, 2 and 4 produced $2\frac{1}{2}$ bushels to the rod; No. 3 only 2 bushels.

Thus far my object has been to determine the relative quality and productiveness of the several kinds. To ascertain the best method of cultivating potatoes I planted two acres with No. 2. On the first part I put 8 cords of manure to the acre, and after ploughing two furrows, one on each side of the lot, I dropped the potatoes which I had selected for seed in the bottom of the furrow, two and a half feet apart, then spread the manure along the furrow on the top of the potatoes. I then ploughed three furrows, and in the fourth dropped the potatoes; manured and ploughed as before until the whole was finished. On the second part I ploughed the land in ridges or back furrow, put on the same quantity of manure as on the first, dropped the potatoes in the hollows between the ridges at the same distance as the first, spread the manure on the potatoes and covered it by turning the ridges back into the furrows.

The third part I ploughed, furrowed and holed at the same distance as the first and second parts, and put the manure into the holes, dropped the potatoes on the top of the manure, and covered with the hoe. In October I gathered the whole; my product was from 200 to 250 bushels per acre. The first and second lots, where the potatoes were under the manure, produced about equally, and I should think ten per cent. more than when they were over the manure, but the first being deeper in the ground cost more labor in digging.

The present year I have planted about three acres, three-fourths of them by first ridging the ground, then dropping the potatoes, then manuring and covering by a furrow on each side as in the second lot of last year's experiment. The remainder I planted in the same manner as third lot. I have gathered but a small part of my present year's crop, but as far as I can judge the result will be about the same as the preceding years.

From the above experiments I have come to the conclusion that as a general rule it is better to plant potatoes under, than over the manure, and that there is no better way of cultivating them, taking labor into consideration, than by first ploughing the land in ridges $3\frac{1}{2}$ feet distant from each other, dropping the potatoes at $2\frac{1}{2}$ feet distance and putting the manure over them, and covering by furrows one on each side.

In 1830 I sowed four rods of land in my garden with potato seed, in rows fourteen inches distant from each other. At the first weeding I thinned them to about three inches by pulling out the least promising; at the second and third weeding I continued to thin them out as before, and finally left them about twelve inches apart in the rows, which gave me about 900 plants. The last of October I gathered them, and from the 900 plants selected 90 of the best. In 1831 I planted the 90 kinds in hills three feet by two and a half distant from each other. In October I harvested them, reserving 20 kinds. Thus far I paid attention to the shape, color and productiveness of the potatoes. The present season I planted the 20 kinds on about 100 rods of land; after ploughing, harrowing and furrowing the land, I dropped the potatoes and put on four cords of manure, covering by two furrows. In June and July I ploughed between the rows and hoed in the usual manner. They are now in the ground and several of the kinds appear to be growing. We have only cooked of the seven kinds here exhibited. Numbers 3 and 4 are dry and mealy; the produce middling. Numbers 1 and 6 are not ripe; I think they will be very productive; as to quality I can say little with confidence until they are all ripe and gathered.

Yours with respect,

PAUL KENT.

LOADED FRUIT TREES.

In looking about among Fruit Trees, we notice an almost unprecedented burthen of fruit upon them. We have seen a number of healthy, large Apple trees broken to the ground by its surplus weight. Writers on Horticulture uniformly urge the necessity of taking off the superfluous fruit rather than prop up the trees to retain an unnatural quantity of it. Where there is such an excess it all must deteriorate and be diminutive and half grown, without nutriment or suitable flavor. If there is only a proper proportion of fruit retained on the tree, it will acquire full size and richness, and when matured be worthy of preservation. A bushel of good apples is of more value than twenty of poor ones. So to a discriminating taste, a peach is better than a pumpkin. There is a prevailing principle in vegetable as well as animal life, that to *overburthen* is to injure the strength and impair the constitution. Some trees have an excess of fruit one season and are barren the next. May not this arise from exhaustion of the resources of the tree rather than from any eccentricity in nature?—*Northampton Courier*.

SIMPLE METHOD OF DESTROYING THE HESSIAN FLY.

As the Wheat crop this season has, in some places suffered considerable damage from the destructive effects of this insect, we are happy to be enabled, by a valuable and obliging correspondent, to publish the following directions for destroying it.

The Hessian fly deposits its eggs on the wheat ear before it is reaped; the egg is so small as to be invisible to the naked eye, but may be very distinctly seen with a microscope; sometimes one grain of wheat will be observed to have several of these eggs on it. They are attached to the wheat by a glutinous substance, deposited around them by the parent fly, by which they are held so firmly on the surface, as not to be easily removed by the motion of reaping, threshing, &c. Shortly after the seeds begin to germinate in the soil, the genial heat of the season brings the young fly from its egg in the form of a very small maggot (as is the case with all insects): these little maggots deposit themselves at the root of the stalk to the seed of which the egg has been attached; between the stem and the lowest blade or leaf, where they may be discovered during the month of May and beginning of June quietly reposing: here they remain until the warmth of the season brings them to maturity, when they commence eating the substance to which they have been attached. It is not until this period that those destructive effects are visible, by the wheat becoming withered and blighted. This accounts for the fact that wheat, which is attacked by this destructive insect, presents a healthy appearance in the month of June, the period at which the embryo fly begins to use food.

Now it is evident that if the eggs of this fly can be destroyed on the seed wheat, by any process that will not also destroy the vegetative quality of the grain, the ruinous effects will be avoided. This can be done by the following very simple process:—

"Soak the seed wheat in water for twelve hours; spread it out on the barn floor, so as to allow the superabundant water to escape: then take fresh slacked lime and mix it among the wheat in quantity sufficient to have every grain covered with the lime, taking care to stir the wheat well with a shovel, so that no particle may escape coming in full contact with the lime, which, when thus applied will in a short time destroy the eggs, and consequently preserve the grain from destruction."

Our correspondent assures us that the egg, which before the application of the lime appears clear and transparent, afterwards becomes opaque, and puts on the appearance of an addled egg. The efficacy of the above remedy has been established by several experiments, one of which we will here relate. Wheat supposed to be infested by the Hessian fly, was taken, one half of the quantity treated with lime, and the other half was sown in the same soil with the prepared, in alternate drills; the result was that every stalk from the prepared seed came to maturity and was productive, whilst the alternate drills which had been sown with unprepared seed, were almost totally destroyed.

The above remedy for so serious an evil cannot be too widely circulated—we would recommend its translation into the French papers, and we would thank the Cures of the country parishioners, to have it made known at their respective church doors, after divine service.—*Canadian Courier*.

ITEMS OF ECONOMY, ARTS, &c.

A simple and useful Invention. An Italian blacksmith has successfully practised a very simple contrivance to diminish considerably the loud noise occasioned by the percussion of the anvil. It is merely to attach a piece of iron chain to one of the horns of the anvil, which carries off a portion of the usual acute sound. But Sig. G. Visini Asso, in the Province of Coma, has introduced an improvement to this, by adding a spring to the basis of the anvil, which, (keeping the chain stretched) diminishes the sound in a much greater degree; and it is equally easy to remove the ring of the chain from the horn of the anvil by a mere blow of the hammer.—*N. Y. Daily Advertiser.*

In boiling salmon, split the fish from head to tail; if you do not do this, but boil it entire or cut horizontally through the middle, it is impossible to cook it thoroughly, the thickness of the back and shoulders being such, that if the outside be properly done, the inside must be little better than parboiled. On the Tweed, and other salmon districts, the latter system is held in abomination.

For making Jelly. Those who would make fine jelly should always avoid boiling the juice of the fruit when it is desirable to have the article when made retain the flavor of the fruit from which it was prepared. After the juice is pressed from the fruit and the proper quantity of sugar added to it, let it be heated until the sugar is dissolved, after this is effected no further heat is required.

A Steel Trap. A gentleman who had long been subject to the nocturnal visitations of thieves in his orchards, wishing to preserve his property without endangering any one's life, procured from a Hospital the leg of a subject, which he placed one evening in a steel-trap in his garden, and next morning sent the crier round the town to announce, that "the owner of the leg left in Mr. ———'s grounds last night, might receive it upon application." He was never robbed again.—*Eng. Paper.*

Corns. Nearly nine-tenths of mankind are troubled with corns, a disease that is seldom or never occasioned but by straight shoes. All methods of extricating corns seem but to afford temporary relief, and never will be attended with complete success unless attention be paid to the shoes. It is very dangerous to cut corns too deep on account of the multiplicity of nerves running in every direction of the toes. Easy shoes, frequent bathings of the feet in lukewarm water, with a little salt and potash dissolved in it, and a plaster made of equal parts of gum galbanum, saffron, and camphor, are the best remedies that can be recommended against this troublesome complaint.—*Toilet of Health, &c.*

Barberous! Common candle snuff, clear of grit, spread on a Razor strop, produces the best edge, in the shortest time of any thing ever tried; so says a New York paper: and they are "up to snuff" in the Empire State. The coat should be spread with a knife—not too thick—and it will last months. There is no "patent" for this discovery; any one may avail himself of it without burning his fingers—provided he uses snuffers. Neither Noyes, Pomeroy nor Emerson, nor any of the stropers, can 'hold a candle to it.'

If you would have a thing kept a secret, never tell it to any one; and if you would not have a thing known of you, never do it.

Hops in New York. The demand from abroad has been so great this year, that nearly the whole crop has been shipped off,—the export has been generally to France, and some to Germany at prices generally below 15 cents. The shipments have been so great that there is not enough left for our own consumption. The consequence is, that the few in market have been monopolized, and the price run up to the unprecedented rate of 75 cents and a dollar. The few sales that have been made for the last week, have been at 75 cents for first sort; 30 to 40 cents for second, and 10 to 15 cents for poor.—*N. Y. Com. Adv.*

Wolves. The wolf sometimes lures a dog into his power, fawning and gamboling around him, by which he is probably mistaken for one of the same species, until an opportunity offers, when he seizes and bears his victim away to his hiding place. Captain Parry saw this stratagem attempted with a Newfoundland dog belonging to one of his ships. The unsuspecting animal had been beguiled into play, and was only saved from the greedy jaws of his play-fellows by the prompt interference of the crew.

Nottingham Pudding. Peel six good apples, take out the core with the point of a small knife, or an apple corer, if you have one; but be sure to leave the apples whole, fill up where you took the core from with sugar, place them in a pie-dish, and pour over them a nice light batter, prepared as for batter pudding, and bake an hour in a moderate oven.—*Gen. Far.*

A prolific Cow. Mr. Abel Woodworth, of New Lyme in this county, has a cow that is only eight years old, that has had twelve calves! and had none till she was three years old. The fact is well authenticated that she has produced *six pair twins*.—*Ashtabula Repub.*

Teasel. This plant is still cultivated in this vicinity, says the Northampton Gazette, but not so extensively as in past years. A farmer in Hatfield recently sold the product of two acres for \$100 per acre; two years are necessary for a crop. An acre sometimes yields 150,000 heads, but often less than 100,000.

Ice. A writer in a New-York paper a day or two since, gives the following as the best mode of constructing an ice-house that will keep ice through the season. It has been usually thought that the edge of a declivity was the only place for an ice-house, but if the following method is really adequate to the end, no matter how level a piece of ground is chosen for the purpose.

It must be a tight frame building, and *above* ground, the four sides of which should have an inside lining, fifteen inches apart, the intermediate space filled with tan; the floor, which should be dry ground, covered with the same material to the depth of about fifteen inches: the attic should have a board flooring, with a scuttle door for entrance, also covered with tan, say about five to six inches: over the whole, a good tight roof, with an entrance to the attic through the gable end.

Sweet Apple Pudding. Take one pint of scalded milk, half a pint of Indian meal, a tea-cupfull of salt, and six sweet apples cut into small pieces—should be baked not less than three hours—the apples will afford an excellent rich jelly. This is truly one of the most luxurious yet simple Yankee puddings made.—*N. Y. Farmer.*

Pugilism. Wm. Byrne, a celebrated pugilist in England, was recently beaten to death, by his antagonist. He died covered with bruises, and wounds, and a heart crushed by defeat. What humane amusement! His competitor was severely bruised. The instigators, the seconds and the principal, had been arrested on a charge of manslaughter.

A Curiosity. A gentlemen of New Haven, (Conn.) has several volumes of the first newspaper that was ever published in England. It was commenced in 1558, and is entitled "The English Mercurie," which, by authority, is imprinted at London, by Christopher Baker, her highness' [queen Elizabeth] printer.

Burning Springs. Several springs have recently been discovered in Pipe creek, a branch of the Big Buffalo creek, and about six miles from Aurora village, containing inflammable gas in great abundance. They were ignited on Sunday last, and were still burning when our informant left, on Wednesday, and will doubtless continue to burn until measures are taken to extinguish the fire.—*Buffalo Bulletin.*

The Harvest. The crops, as far as we have learned, are likely to exceed all anticipation. Even the districts affected by the fly, are found not to have received so much damage as had been apprehended. The weather, too, has been remarkably favorable for drying and getting in crops. We should imagine, that even making the largest allowance for increased consumption, produced by immigration, that there will be a surplus of grain in the country.—*Detroit Journal.*

Manufactures.—The most important manufacturing State in the Union is Massachusetts. In this State, in 1831, there were \$12,390,000 invested in the cotton manufacture; mills, 250; cotton worked up, 24,000,000 lbs. Next in importance is Rhode Island. In that State were 116 mills, and over \$6,000,000 invested, consuming 10,000,000 lbs. raw material. Maine, the lowest in this respect among the New England States, had only 8 mills and a capital of \$700,000. In the whole United States the number of cotton mills, in operation in 1831, was 795; amount of capital \$40,714,984; quantity of cotton consumed, 77,757,316 lbs.—*Newburyport Herald.*

Very Good. The President and suit visited the deaf and dumb asylum while at Hartford. The lads were arranged on each side of the passage, and welcomed him with their mute huzzas, waving their hats. The pupils performed some of their exercises in their recreation rooms, very much to the gratification and amusement of the company. The Vice President was introduced by the teacher to a young lady from Albany, and had some conversation with her on the black board. Among other questions, he asked her age. With a rather roguish expression of countenance, she quickly wrote, 'are you married, sir?' Mr. Van Buren is a widower, and her reply raised a laugh at his expense.

"Let not sleep," says Pythagoras, "fall upon thy eyes, till thou hast thrice reviewed the transactions of the past day. Where have I turned aside from rectitude? What have I been doing? What have I left undone, which ought to have been done? Begin this from the first act, and proceed, and in conclusion, at the ill which thou hast done be troubled, and rejoice for the good."

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 21, 1833.

Superior Oats. Mr. Jacob Smith of Duxbury, Mass. has raised an unprecedented crop of oats. Four fifths of an acre produced SEVENTY FOUR BUSHELS AND THREE PECKS! and the average height of the plants at the time of harvest was *five feet four inches!* A sample of these oats, including the stems, heads, &c. as they grew, may be seen at the office of the New England Farmer, No. 52 North Market street.

CULTURE OF WHEAT.

In remarks on this subject in our last [p. 38] we gave some facts and arguments, which induced in us an opinion that the want of lime, or some of its compounds, or of some other alkaline substance in the soil, was one cause, if not the most usual cause of the failure of wheat crops in New England: and if this *natural deficiency* in soils not capable of producing wheat were *supplied by art*, wheat might be produced on lands, which without such supply cannot mature that valuable crop.

We agree in opinion with our able correspondent, who with the signature "B" has so often favored us and benefitted the community with valuable agricultural articles, that "the true cause of the uncertainty of the wheat crop in New England is a want of the specific food of the plant—in the soil."* But we apprehend that the article wanting is *lime not nitrogen*.†

The theory that *animal manure* is requisite for the production of wheat, if not originated was ably advocated by an English writer by the name of William Grisenthwaite. According to Loudon [En. Agr. p. 1117] this author was an apothecary of Wells, in Norfolk. His work, a 12mo., was entitled, "A new Theory of Agriculture, in which the Nature of Soils, Crops and Manures, is explained, many prevailing prejudices are exploded, and the application of Bones, Gypsum, Lime, Chalk, &c. determined on scientific Principles." We have not seen this work, but the following extract from it, taken from "Memoirs of the New York Board of Agriculture," vol. iii. p. 339, will give an idea of the "Theory" of the writer.

"If we examine the straw of wheat, we shall find it composed of what may be considered common vegetable matter, or matter composed of oxygen, hydrogen, and carbon, with a small quantity of carbonate of lime; so also, if we examine the constituents of the grain, we shall find them distinguished into starch and gluten; and if we carry our researches still further, we shall find that the elements of the starch are precisely the same with the elements of common vegetable matter; but the elements of the gluten will be found analogous to those of animals; or, in addition to oxygen, hydrogen and carbon, there will be found nitrogen. The production of this nitrogen, as has been already observed, cannot be effected by mere common vegetable matter; and, therefore, the manure employed in the production of the straw and the starch, could not produce the gluten also." * * *

* See page 1, of the current vol. of the N. E. Farmer.

† Nitrogen is a gas, that is to say, an air-like or aeriform substance. This gas is fatal to animal life and was on this account named by Lavoisier, *Azote* or *Azotic gas*, from two Greek words signifying *without life*. This being but a negative property, was thought by later chemists an improper term, and *nitrogen*, from two Greek words, signifying to produce or generate nitre, was substituted. Nitrogen exists in a great number of compounds, earths, &c. With potash, it produces nitre or salpêtre; with oxygen, nitric acid or aquafortis, &c. &c.

"That the gluten of wheat flour may always be present, it is necessary that a quantity of animal substance should exist in the manure applied to the land where the wheat crop is intended to be raised. That a certain portion of such animal substance is applied, is proved from the fact of gluten being always found to exist in that grain; but it is highly probable, that the quantity is not always sufficient; and if not sufficient the crop will be defective either in quantity or quality. If we pursue our investigations a step farther than we have done, we shall discover that phosphate of lime* is as constant a constituent of wheat flour as gluten itself. Phosphate of lime, therefore, is as much needed for the production of a crop of wheat as the substances which supply the starch and gluten," &c. &c.

According to this writer, lime is necessary to furnish a constituent of wheat-flour; but it must be combined with phosphorus or phosphoric acid, and thus become phosphate of lime, or it will not answer that purpose. We, therefore, have three elements of wheat which must be obtained, viz. nitrogen, phosphorus and lime, and the absence of either would prove fatal to the perfection of the wheat crop. We will then look out for supplies of these indispensables.

1. Nitrogen, alias azote, wanted to make gluten for wheat. This nitrogen, says Grisenthwaite, may be found in horn, bones, urine and some other animal matters, used for manure. Very good; but Dr. Dwight, we believe correctly, stated in substance, that animal manure causes the vegetable juice to ascend with such rapidity as to rupture the vessels of the stock, and permit it to run out, originating honey-dew, and finally rust or blast, lodging or lying down of the grain, &c.† We must, therefore, make shift without, or seek some other source for our nitrogen. But why not let the wheat plants help themselves to nitrogen? Almost four-fifths of the atmospheric air which surrounds vegetables as well as animals, and which is as necessary for the existence of the one as of the other, is composed of nitrogen. But, say the objectors, plants are dependent altogether on their roots for nourishment, and take nothing from the air, which goes to their support or growth. Sir Humphry Davy, however, in speaking of nitrogen says, "as it is found in some of the products of vegetation, it may be *absorbed* by certain plants from the atmosphere."‡ Earths of all kinds, taken from wells, ditches, &c. will absorb nitrogen or nitre, from the atmosphere, and why may not plants? Not only plants, but animals may receive nourishment by their pores. Sir Henry Steuart says, "Men, for example, have been known to become so debilitated by age or disease that they could receive no food by the ordinary organ of the mouth. The consequence has been that they were immersed in milk, and veal broth baths, and fairly subsisted by means of absorption. Thus every one of their pores became like leaves for the *introsusception* of food. Some few years since an instance occurred in a noble Duke of sporting notoriety, who was thus supported during the last months of his life."§ Agnir,

Wanted, Phosphorus, one of the constituents of Phosphate of Lime, and necessary for the composition of wheat-flour. We are not positive, but have little doubt but that phosphorus as well as

* Lime, combined with phosphoric acid.

† See New England Farmer, vol. xi. p. 393.

‡ Elements of Agricultural Chemistry, p. 147, Philadelphia.

§ Steuart's Planter's Guide, p. 349, Thorburn's Edition.

nitrogen exists in the atmosphere, though in such minute quantities as not to be detected by common chemical analysis. It is, probably, obtained from air by chemical affinity, and becomes apparent in putrescent substances, fish, flesh, as well as in the glow worm, the fire-fly, rotten wood, the will-o-wisp, &c.

Wanted, lime or calcareous matter, as one of the constituents of the wheat-crop, both straw and grain. It has been shown in a valuable work entitled "*Essay on Calcareous Manures*," by EDMUND RUFFIN of Virginia, that calcareous earth, or lime, does not exist in all soils. "Vegetable matter," he says, "abounds in all rich land, it is admitted; but it has also been furnished by nature in quantities exceeding all computation, to the most barren soils we own.

"But there is one ingredient, of which not the smallest proportion can be found in any of our poor soils, and which wherever found, indicates a soil remarkable for natural and durable fertility. This is *calcareous earth*. These facts alone, if sustained, will go far to prove that this earth is the cause of fertility, and the cure for barrenness."*

Nitrogen and phosphorus being gaseous or aeriform exist in the atmosphere, from which great reservoir they may be abstracted for the use of plants; but lime cannot assume a gaseous form, and therefore, cannot be found in the atmosphere. Neither can lime be *created* by those plants for whose use it is indispensable. "Even animals," says Sir Humphry Davy, "do not appear to possess the power of forming the alkaline and earthy substances. Dr. Fordyce found, that when canary birds at the time they were laying eggs, were deprived of access to carbonate of lime, their eggs had soft shells; and if there is any process for which nature may be conceived most likely to supply resources of this kind, it is that connected with the reproduction of the species." Wheat too, we know is given to fowls in winter to furnish phosphate of lime for their eggs.

We will finish this article, which is much longer than we had intended, by a summary view of the facts and arguments which led to our tenets on this subject.

1. We believe that lime as an ingredient in soils is necessary for the production of wheat because its use as a manure has enabled farmers to raise it on lands which without lime would not produce wheat.

2. Lime is always found by chemical analysis both in the straw and in the kernel of wheat; therefore it must either exist naturally in the soil, or be supplied by art, so that it may be absorbed by the roots, or inhaled by the leaves of the plant. It cannot be absorbed by roots if not in the soil, nor inhaled by the leaves in any case, because its base is a *nitral*, or earth, and it is never found in a gaseous form.

3. Those soils which contain every other requisite for the production of wheat—which are rich in vegetable and animal manure, will not bring that plant to perfection without *lime*.

4. From conversation with some of our best Massachusetts cultivators, who tell us that they cannot raise wheat without lime.

We do not say that the want of lime is the *sole cause* of the failure of wheat, but that warm and wet weather, while the kernel is filling, as stated by our able correspondent, H. C. page 25 of the current volume of N. E. Farmer, as well as insects,

diseases and disasters, may effect the partial or total destruction of a crop, even when lime is used. But we believe that *without lime*, or some alkaline substitute, a wheat crop *must fail*, though *with lime it may fail*.

ITEMS OF INTELLIGENCE.

The Hon. ALEXANDER H. EVERETT will deliver the Address before the Massachusetts Horticultural Society, on the fifth annual celebration, in September.

Working Men's Convention. A Convention of Farmers, Mechanics and Working-men is to be held in Boston, on the 2d day of October. The delegates are requested to ascertain facts in regard to the number and amount of mortgages; whether they have increased with the Banks, whether held by Bank Directors, Manufacturers, &c.; the number of marriages, compared with former times; the mortality among the women and children employed in factories; the increase or decrease of land owners; the greater or less degree of equality in society.

The Season. The Detroit Journal of the 24th ult. says that "the prospects for the latter harvest are most cheering. We do not remember to have seen corn or potatoes show a more healthful and luxuriant appearance at any former season. The same may be said of every species of vegetable."

The New Haven Herald observes, "The season around us is said to be the finest that has occurred for many years. The early crops of hay, grain, oats, and vegetables are unusually productive; the orchards are loaded with fruit; and the minor wild fruits, the various berries which abound in our fields and woods, are prolific beyond measure."

The Rochester, N. Y. Advertiser, states that "the wheat harvest is commenced, and never do we recollect to have seen more abundant crops, either as to quantity or quality. Grass and oats are very good, and corn, notwithstanding the backwardness of the season, bids fair to do well."

The New Hampshire Telegraph says, "The crops in this vicinity, though a little backward, do look beautifully." The Spectator, of Newport, N. H. of the 10th inst. states, that "Last Saturday morning the mercury stood at 39 degrees at sun rise, there was quite a heavy frost, and some corn was injured considerably. It was rather amusing than otherwise, to see the farmers mowing in their meadows with their coats on, and like old Grimes 'All buttoned down before.'

And at the end of every swath they were under the necessity of stopping and blowing their hands to warm them."

BOSTON FANEUIL MARKET, Aug. 21, 1833.

Vegetables. Early Potatoes, 50 cts per bushel; Peas, 1 25 cts per bus; String Beans, 75 cts. per bush.; Squashes, Scallops, 12 1/2 cts pr doz; Winter Squashes, 4 cts. per lb.; Cucumbers, 6 to 8 cts. pr doz; Turnips, Onions, Beets and Carrots, 6 1/2 cts pr doz.; Shell Beans, 10 cts pr qt; Saba Beans, 25 cts. per qt.; Green Corn, 12 1/2 cts pr doz; Tomatoes, 12 1-2 cts per doz.; White Portugal Onions, 1 25 cts. per bushel.

Fruit. Pears, \$2 per bushel; Apples, from \$1.00 to \$1.50, according to quality; Whortleberries, 6 cts pr qt; Blackberries, 12 1/2 pr box; Peaches, from 12 1/2 to 37 1-2 pr doz; Apricots, 50 cts. pr doz.; Musk Melons, 1s to 2s per piece; Yellow Gage Plums, a superior variety, 50 cts. pr doz.; Horse Plums, 25 cts per pt.

NEW ENGLAND FARMER'S ALMANAC FOR 1834.

NOW in Press, and will soon be published the *New England Farmer's Almanac for 1834*, by THOS. G. FESSENDEN, Editor of the New England Farmer, and will be for sale Wholesale and Retail, by GEO. C. BARRETT, at the N. E. Farmer office. Dealers supplied on very low terms, and orders are solicited early.

The flattering reception and extensive circulation of the six first numbers have induced the publishers to render the 7th No. as useful and interesting as possible. a 14

PATENT GRATER CIDER MILL.

DANIEL LE LAND having purchased the patent of the above named Mills, would call the attention of Farmers and others in this vicinity, to the undersigned certificates of their merits, and feels confident that they are superior to any other in use, for grinding apples.

These Mills are drawn by one horse. Six, eight, ten, and twelve feet wheels are used, some with one and some two drums. They may be placed in a building, and so fixed as to grind upon the press, or into a trough. The following certificates will probably give the public some proof of their value.

"This may certify that we the subscribers have made use of Joel Farnum's Patent Grater Cider Mill, for three years past. We grind a cheese of cider in one quarter of the time we did in the old mill; it grinds better, makes more and better cider; we grind upon the press, and save the shoveling of the pumice, and the juice may be extracted in less time.

JOHN CLARK, 2d.
JAMES P. CLARK.
Medway, August 8, 1833.

"This may certify that we the subscribers, have used the above named machine for three years last past, and approve of the plan of grinding apples. We save one third part of labour and time in grinding and laying up a cheese of cider. It grinds better than the old mills generally do, the cider is clearer and contains less sediment; the cider is pressed out in less time, and the mills are kept in repair at less expense than the old mills.

AARON LE LAND.
JOSEPH P. LE LAND.
Sherburne, Aug. 9, 1833.

"This may certify, that I have assisted in the making of cider in the above named mills, and consider it a valuable improvement in the making of cider. At one time we ground and laid up, apples sufficient for eight barrels of cider, in forty minutes, by the watch. We save one half of the time, in grinding and laying up the cheese.

JOTHAM W. ROGERS.
For further particulars, apply to J. R. NEWELL, Agricultural Warehouse, where Mills are on hand or will be furnished at short notice, or to DANIEL LE LAND, Sherburne. Sherburne, Aug. 11. 1833.

PETTICOAT ROBES, at 3s.

ELIAB STONE BREWER has just received 500 three breadth Petticoat Robes for 3s. For cash only at 414 Washington St. a 20

RUSSIA DIAPERS, at \$2 a Piece.

ELIAB STONE BREWER has just received 1000 pairs Russia Diaper 1-2 ell. Selected in Russia by Wm. Ropes, Esq. expressly for the retail trade of Boston, which are offered for sale for cash only, at 414 Washington Street. a 20

GRASS SEEDS,

(for fall sowing.)

FOR sale at the New England Seed Store, 51 and 52 North Market Street.

Clover, (Northern)—Herds Grass—Red Top—White Clover (fine imported)—Lucerne, &c. &c.—Wholesale and Retail.

SEEDS.

(for fall sowing.)

FOR sale at the New England Seed store, connected with N. E. Farmer office 51 & 52 North Market Street.

White Portugal Onion seed—Silver Skin do.—Fall or Prickly Spinach—Black Spanish or Winter Radish—Celery, &c. &c.

SEEDS,

for West Indies, &c.

Merchants, and masters of vessels and others trading to the West Indies, South America, &c. can be furnished with Boxes of seeds assorted and suitable for those markets at \$3 and \$5 per box.

Also, Smaller assortments at \$1 per box.

BOOKS.

Books upon Agriculture, Horticulture, and Rural Economy, Published and for sale by Geo. C. Barrett, N. E. Farmer Office, 52 North Market st. Wholesale and Retail Booksellers supplied on very liberal terms, and their orders solicited. aug 14

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

BULBOUS ROOTS.

JUST received at the New England Seed Store, 51 & 52 North Market street, one Lot fine Bulbous Roots,—containing Tulips, variety, at 12 1-2 each, or \$1 a dozen; Hyacinths, Dutch, very fine sorts, without names; Polyanthus Narcissus, do. do.; Sweet Scented, do. do. with names. Expect next week an invoice of very splendid Hyacinths, Tulips, &c. &c. aug 14

BRIGHTON MARKET.—MONDAY, AUG. 19, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day 435 Beef Cattle, 18 Cows and Calves, 3612 Sheep and Lambs, and 230 Swine. 300 swine were at market Thursday, and sold.

PRICES. Beef Cattle.—Last week's prices were not supported, we notice a single yoke (extraordinary fine) taken at \$6, and a few yoke at 5 75. We quote prime at \$5 25 a 5 75; good at 4 75 a 5 25; thin at 3 25 a 4 25.

Cows and Calves. Sales were noticed at \$16, 20, 23, 25, 28, and \$30.

Sheep and Lambs.—Dull: Lots were taken at \$1 12, 1 21, 1 25, 1 37, 1 50, 1 67, 1 75, 1 88, 1 92, 2 25, and 2 33.

Swine.—Those at market were sold in one lot at about 5 c.; at retail, 5 c. for Sows, and 6 c. for Barrows.

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

MISCELLANY.

HARVEST HYMN.

BY MRS. SIGOURNEY.

GOD of the year!—with songs of praise,
And hearts of love, we come to bless
Thy bounteous hand, for thou hast shed
Thy manna o'er our wilderness;—
In early spring-time thou didst fling
O'er earth its robe of blossoming—
And its sweet treasures day by day,
Rose quickening in thy blessed ray.

And now they whiten hill and vale,
And hang from every vine and tree,
Whose pensive branches bending low
Seem bowed in thankfulness to thee,—
The earth with all its purple isles,
Is answering to thy genial smiles,
And gales of perfume breathe along
And lift to thee their voiceless song.

GOD of the seasons! Thou hast blest
The land with sunlight and with showers,
And plenty o'er its bosom smiles
To crown the sweet autumnal hours;
Praise, praise to thee! Our hearts expand
To view those blessings of thy hand,
And on the increasing breath of love,
Go off to their bright home above.

FLORAL DICTIONARY, OR EMBLEMATICAL DEFINITIONS.

"In eastern lands they talk in flowers,
And they tell, in a garland, their loves and cares;
Each blossom that blooms in their garden bowers,
On its leaves a mystic language bears."

Acacia, signifies Friendship.

Amaranth, Immortality.

Belvidere, I declare war against you.

Balm, Sympathy.

Blue-Bottle, Constancy.

Cowslip, I esteem, but cannot love you.

Crocus, Presumption.

Common China-aster, 'Tis your gold attracts,
not yourself.

Chickweed, An appointed meeting.

Cypress, Despair.

Coal's leaf, Bond of affection.

Citonia, Pleasantry.

Calacanthus, Moral beauty, superior to personal charms.

Coral honey suckle, Gratitude and affection.

Daisy, Unchanging sweetness and fidelity.

Flowering-Almond, Perfidy.

Garden gilly flower, Durable beauty.

Hæthorn, Hope.

Hyacinth, You trifle with me.

Hortensia, You are cold.

Indian Pink, Aversion.

Iris, I have a message for you.

Lilac, The first emotions of love.

Lavender, Distrust.

Locust blossom, Affection beyond the grave.

Lilly of the Valley, Modest beauty and retired worth.

Little China-aster, Innocence.

Mountain Pink, Independent and aspiring.

Musk rose, Capricious beauty.

Multi flora, Liberality without ostentation.

Myrtle, Love.

Marigold, Jealousy.

Narcissus, Egotism or self-love.

Olive, Peace.

Polyanthus, Confidence.

Pea-blossom, Fickleness.

Red Rose, Beauty.

Red Pink, Pure and ardent love.

Rose Acacia, Elegance.

Rose Geranium, Preference.

Red Poppy, Consolation.

Sweet briar, Simplicity.

Spanish Jessamine, Interested regard.

Snow drop, Officious interference.

Tulip, Beauty, not intellectual.

Thyme, Activity.

Violet, Modesty.

Variegated Pink, Refusal.

Veronica, Fidelity.

White Rose, Silence.

White Pink, Purity of Sentiment.

White Jessamine, Amiability.

White Lilac, Youth.

Woodbine, Misfortune.

Yellow Rose, Infidelity or disdain.

A RHYMING LETTER.

ADDRESSED TO THE REV. J. NEWTON.

BY WILLIAM COWPER.

"MY VERY DEAR FRIEND: I am going to send, what, when you have read, you may scratch your head, and say, I suppose there's nobody knows, whether what I have got, be verse or not; by the tune and the time, it ought to be rhyme, but if it be, did you ever see, of late or yore, such a ditty before?"

"I have writ Charity, not for popularity, but as well as I could, in hopes to do good; and if the reviewer, should say, to be sure, the gentleman's muse, wears Methodist shoes, you may know by her pace, and talk about grace, that she and her bard, have little regard, for taste and fashion, and ruling passion, and the hoydening play of the modern day; and though she assume a borrowed plume, and now and then wear a titting air, 'tis only her plan to catch if she can, the giddy and gay, as they go that way, by a production on a new construction; she has baited a trap, in hopes to snap, all that may come, with a sugar plum. His opinion in this will not be amiss; 'tis what I intend, my principal end, and if I succeed, and folks should read, till a few are brought to a serious thought, I shall think I am paid for what I have said, and all I have done, though I have run, many a time, after rhyme, as far from hence to the end of my sense, and by hook or by crook, write another book, if I live and am here, another year."

"I have heard before, of a room with a floor, laid upon strings, and such like things, with so much art in every part, that when you went in, you were forced to begin, a minuet-pace, with an air and a grace, swimming about, now in and now out, with a deal of state, in a figure of eight, without pipe or string, or any such thing; and now I have writ, in a rhyming fit, what will make you dance, and as you advance, will keep you still, though against your will, dancing away, alert and gay, till you come to an end, of what I have penned, which that you may do, 'ere madam and you, are quite worn out, with jiggling about, I take my leave, and here you receive, a how profound, down to the ground, from your humble me.

W. C."

Beauty. Socrates called beauty a short-lived tyranny; Plato, a privilege of nature; Theophrastus, a silent cheat; Theocritus a delightful prejudice; Carneades a solitary kingdom; Domitian said that

nothing was more grateful; Aristotle affirmed that beauty was better than all the commendations of the world; Homer, that it was a glorious gift of nature; Ovid, alluding to him, calls it a favor bestowed by the gods.

A Poet's Love.—Of all the heaven-bestowed privileges of the poet, the highest, the dearest, the most enviable, is the power of immortalizing the object of his love; of dividing with her his amaranthine wreath of glory, and repaying the inspiration caught from her eyes with a crown of everlasting fame.

And how have women repaid this gift of immortality? O believe it, when the garland was such as woman is proud to wear, she amply and deeply rewarded him who placed it on her brow. If in return for being made illustrious, she made her lover happy,—if for glory, she gave a heart, was it not a rich equivalent?

BROOKS' PATENT SILK SPINNER.

THE public attention is invited to this machine. It is adapted to domestic use, is simple in its construction, occupies a small space, and may be used to advantage by women and children. This machine may be obtained by applying to T. R. NEWELL, at the Agricultural Warehouse, No. 52 North Market street, Boston; or to the Patentee, ADAM BROOKS. SCITUATE, July 22, 1833.

PEMBROKE BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butte. Salt. 6600 loaves Table Salt.

Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale.
June 5 CHAS. I. CAZENOVE & CO.

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

TO SUBSCRIBERS.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half-bound and lettered, at 75 cents per volume, by leaving them at the Farmer Office.
July 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[] No paper will be sent to a distance without payment being made in advance.

COMMUNICATIONS.

THE CULTURE OF WHEAT.....No. II.

MR. EDITOR.—In my recent communication on the blighting of wheat, which you have done me the honor to lay before the public, I suggested that its cause was atmospherical; or, if you prefer it, meteorological; or to dispense with hard words, that it was owing to the particular character of the weather occurring at the time, when the wheat was in the precise condition to suffer from it.—Under these circumstances no human prudence can effectually guard against it, since it is utterly beyond our control or calculation.

I had then given no other attention to the subject than the observation of my own field, and that of some of my neighbors. Since that time however, I have examined the best authorities in my library, and find my own suggestions confirmed by the opinions of some of the most eminent writers on agricultural subjects.

The principal diseases to which this valuable crop is subject, are smut, blight, mildew, and rust. Smut is a disorder very well understood. Of this there are two kinds; but, as a preventive of this disease has been ascertained, the farmer has only to complain of his own negligence, if he suffers from it. Of the other diseases, blight, mildew, or rust, they are not very nicely distinguished from each other; indeed the terms are often indiscriminately applied to the same appearances or effects; and though by very acute and accurate observers, these terms will be distinctly and appropriately applied to three different conditions of the diseased plant, or, if you prefer it, to three different diseases of the wheat plant, yet as the specific distinctions of these diseases are not familiarly known, nor their particular causes investigated, and as the fatal results similar in all the cases, are much more important than the characteristic differences, we shall speak of the whole under the general term of blight.

I suggested that my wheat was struck with the fatal blast, when it was in the flower and the kernel was just forming; and the weather at the time extremely hot and sultry, with rain and sunshine intermingled, and the earth steaming most profusely under the intense heat. Now permit me to quote from Sir John Sinclair's General Report of the Agriculture of Scotland, vol. i, p. 473, &c.

"Blight may perhaps be defined as an internal disease in the ear or spike of the wheat, either affecting all, or only a part of the florets, producing an entire or partial deficiency of seeds, or in a lesser state of the disease, rendering the grains small, shrivelled, and light. Blight is probably produced by heavy rains falling at the time the wheat is in flower, that is, when the anthers are protruded from the florets; and by which rains, the pollen farina fecundans or vivifying dust of the anthers is washed away before it has come to sufficient maturity to impregnate the stiles leading to the ovaries or receptacles of the embryo grains or seeds.

"In 1808, 1809, and 1810, serious injury was suffered in many parts of Britain by disease, and consequent defalcation of the wheat crop, which consisted of a combination of the blight and mil-

dew, and appeared to have been occasioned by the circumstances of the weather, mentioned above as productive of both." The following description of that complicated and destructive disease has been abstracted from answers made to queries proposed by Sir John Sinclair to an intelligent farmer. I quote only a part.

"From the best information I can procure, the mildew began to make its appearance on the straw and ears of the growing wheats, immediately subsequent to a heavy fog or mist, rising as it were out of the ground, about the 4th to the 10th July 1808, and which was followed by much misty and rainy weather, attended by considerable heat and very little wind. The peculiar fog or mist, above alluded to, is called ground rook, in some parts of Scotland, and strongly resembles a thick smoke, which appears to rise from the surface of the earth." This is peculiarly the weather, which I meant to describe.

Then again in his Husbandry of Scotland, vol. ii. p. 124, Appendix, in an essay by Sir John Sinclair himself, on this very subject, in which he gives as he says, the results of a very extensive inquiry made towards the end of August and the beginning of Sept. 1808, into the nature and causes of these distempers, at which time blight, rust or mildew, had affected the crops of many of the most productive districts, both in England and Scotland, he mentions "that a respectable friend of his (Geo. Dempster, Esq. of Dunnichen,) informs me, that his wheat turned out a miserable parcel of shrivelled stuff, neither injured by the mildew or smut, but that its bad state is to be entirely imputed to heavy rains, when in flower, by which it was laid." "According to Du Hamel, the rust is owing to dry gloomy weather happening when the corn is at the height of its vegetation.—Tull observes, that the rays of the sun are necessary for keeping the wheat healthy and strong, as it is doubtless the native of a hot country. Any thing therefore that interrupts the rays of the sun, must be injurious to that grain. And in America the mildew is attributed to the fogs and heavy dews, which come on as the season advances.—Sometimes the fogs and mists are so close and thick, that the air seems in some degree to have lost its elastic powers, so that neither animals nor vegetables can endure it." I quote here authorities to show how strongly they attribute these diseases of wheat to an atmospheric influence.

I return again to the account of the extent of this injury to the wheat crops in Great Britain, given by the same intelligent writer, quoted first from the General Report of the Agriculture of Scotland, a distinct work from Sinclair's Husbandry of Scotland. "After this appearance of mildew, the wheat crop was much lodged by heavy rains about the beginning of August; and in several instances the straw had become so tender by the effect of the disease that it burst open in bending under the weight of the rain. By this, entire fields were destroyed, so as not to contain a single grain of wheat in the ears, and the straw became utterly unfit for fodder. In such cases, whole fields that promised ample crops, were mown and led into the fold-yard as bottoming to the dung-hills; while others were dried like hay,

and built up in stacks, to bed the fold-yards, feeding sheds, and stables, as wanted. In one instance, in Northumberland, a removing tenant absolutely refused to reap and remove his last crop of wheat, which was utterly useless to him, but might serve his successor, to convert into muck, and he was found not liable to the charge, which would have been for the sole benefit of another person. In other cases where the plants remained alive and unbroken, the injury was not so entire, yet sufficiently distressing, by the diminution of the quantity of produce, and the deterioration of the quality of the grain, which remained. This varied in different proportions according to circumstances. Crops that were estimated at the beginning of July to produce 40 bushels of good wheat from each acre, were valued at harvest to give 6, 10, 12, or up to 20 bushels of very inferior grain, some of which did not command the price of inferior oats; and many farmers accordingly gave their bad wheat to their work horses and sold their oats. The whole of the injury was not attributable to mildew, but proceeded from the concurrence of two other causes; a blight in the ear, occasioned by heavy showers of rain, while the wheats were in full flower, by which the pollen was washed away, and prevented from fecundating the florets. This idea is strengthened by the circumstance of the upper florets of the ears, and very often the whole of one side of the head, being generally barren. In consequence of a great deal of the crop having been lodged by heavy rain at the beginning of August, the grain produce when impregnated, became *sloomy*, or small, shrivelled, and ill filled. Both of these causes are known to injure grain crops materially, in years when the mildew has not been noticed."

"No discrimination of soils could be pointed out, as more or less affected by the disease. It attacked the crops of wheat on strong as well as on free soils; and the only observable difference was that high, open, free airy situations were comparatively less diseased, while low grounds, much sheltered by high hedges, hedge row trees, and plantations, and situations near rivers, were obviously and considerably more materially injured. The near neighborhood of the sea seemed to have a beneficial influence in preventing or lessening the disease. Much of the wheat crop in various soils and situations was comparatively exempted; or so little injured as to give an abundant produce, and of good quality. But no circumstances occurred that could throw any light on the causes of this difference, at least in a practical view of the subject, so as to point out any means of preventing or even lessening the evil on any future opportunity."

"Upon the whole" the writer concludes "this complicated disease, by which such serious injury is caused to farmers and the public, appears to have been occasioned by the unfavorable state of the weather at the time of flowering, combined with a continuance of unfavorable weather, during the after progress of the wheat in filling and ripening, and to be utterly unsusceptible of any preventive, precautionary, or curative attempts by any human efforts."

Now the situation of my own wheat crop, which

I this year lost by blight, was precisely such an one as that described above as peculiarly exposed to injury. It was on an alluvial meadow; near a river, surrounded by hills on three sides, and subject to copious exhalations from the stream. The two blasted crops in my neighborhood, referred to in my former communication, were similarly situated. The rankness of the growth of my wheat, and the fact that some portion of it was lodged, no doubt contributed to create a predisposition or liability to the disease. But it was obviously affected by all the local and temporary causes above referred to; and to them, and not to any particular condition of the soil, to the superabundance or deficiency of any particular ingredients in the soil, its blight, in my opinion, is to be attributed.

As the subject is of great importance, I beg leave to mention other authority in relation to it, and when I refer to John Brown, of Markle, it will be understood by those competent to judge, that for science in Agriculture and practical knowledge and experience, no higher authority can be quoted.

In his treatise on Rural Affairs, vol. ii, p. 24, &c. he says, "Whether blight and mildew are considered separately, or viewed as one and the same disorder, appearing in different periods of the plant's growth, we are convinced that both may with truth be reckoned to proceed from an unhealthy atmosphere, when the crop is in certain stages of its progress to maturity." "Some soils are naturally so moist at bottom, that dampness issues from them at all times. Superior culture and excessive manuring are apt to cause a crop to be early lodged; in which case one disease or other is sure to seize upon it; and a southern aspect, and every confined situation, are much more hazardous than those of a northern or western exposure and where the air has free egress. In a word, when hoar frost or vapor of any kind is dispelled by wind, no danger will follow to the crop, but wherever a hot sun is the agent, we have repeatedly noticed the most serious losses."

"The opinions already expressed respecting the diseases of wheat receive considerable support from what happened with crops 1808 and 1809. That mildew acted, in numerous instances, as the destroying agent of crop 1808, is universally acknowledged; but that the defectiveness of that crop was entirely owing to mildew may safely be questioned. In fact the chief injury proceeded from an unhealthy or pestilential atmosphere, at the time when the grain was in an embryo or imperfect state. Owing to that unhealthiness something like abortion seemed to take place in the parent plant, after the foetus of the young grain was formed, as was evident from more than one half of the cups or vessels, prepared by nature for its reception, being totally void of substance, notwithstanding that every part of the ear had blossomed equally well, and promised to furnish a numerous and healthy progeny."

"It shall now be inquired, how this abortion was brought about, which we have stated as so destructive to the wheat crop of 1808. This may be satisfactorily elucidated by a reference to the weather, which prevailed through the months of July and August, as it is in these months that the diseases of wheat always appear, that of smut excepted, which is not generated by an unhealthy atmosphere. The month of July was excessively warm, more so than remembered by the oldest man living; and from the beginning to the 20th of

the month, the slightest moisture was not perceivable. Owing to this uncommon heat, wheat plants upon all soils not composed of clay or strong loam, were, in a manner, at a stand with respect to growth, being enfeebled by the fierce rays of the sun, while any wind that blew was so sultry, that the evil was rather increased by its effects. The ground in consequence of this intense sunshine, felt something like burnt brick when taken from the kiln; of course when the rains fell, smoke issued from the surface, something like what proceeds from lime-shells when water is thrown upon them; and this exhalation of vapor, continued in a greater or less degree, till the soil was saturated with moisture, when the air became cooler and more temperate. Under these circumstances it was not to be expected that the wheat crop could escape from the danger with which it was encompassed. Apprehensions therefore, were entertained that the fields, already in a sickly and declining state, would soon fall victims to the pestilence, which raged in the atmosphere; and the result soon showed that these apprehensions were too well founded. With the exception of the lands upon the sea shore, preserved we presume by refreshing breezes from the sea, every field was discovered to be more or less injured."

I have no disposition, Mr. Editor, to establish or controvert any particular theory. The subject is of the last importance to the agricultural community. It is from this consideration that I have given you the results of my own limited experience; and the far more valuable opinions of the distinguished, scientific, and practical farmers quoted above. Other facts already in my possession and which I am taking means to obtain in relation to this important culture, if thought likely to throw light upon the subject, shall be placed at your disposal.

ORES.

From a late Geological Report, by Professor HITCHCOCK, published in the American Journal of Science.

IN HINSDALE, N. H. An extensive bed or vein of the black and silicious oxides of manganese have been found in this town. It appears near the top of a hill, and the adjacent rocks are not visible. The ore strongly resembles that from Plainfield.

IN WINCHESTER, N. H. Between one and two miles east of the centre village in this town may be seen large quantities of the black and red oxides of this metal of the same character as in Hinsdale. These localities have as yet, attracted no attention except from a few mineralogists. My information and specimens were furnished me by Mr. John L. Alexander of Winchester.

GOLD.—It may perhaps excite a smile, to see gold occupying a place in a description of the minerals of Massachusetts. It has not indeed been found in this state; but I am able in this place to announce the existence of a deposit of this metal in the southern part of Vermont; and I feel no small degree of confidence, that it will be found in Massachusetts. A statement of the grounds of this belief, may save me from the charge of extravagant expectations.

I have already described an iron mine, as occurring in Somerset, Vermont. It is owned by

S. V. S. Wilder, Esq. of Brooklyn, New York, who has erected a bloomery forge near the spot. Sometime ago, one of the workmen engaged in these iron works, saw in the American Journal of Science, a suggestion of Professor Eaton, of Troy, that since the gold of the Southern States, and of Mexico, is in talcose slate, we might expect to find it in the same rock in New England; especially about the head branches of Deerfield river. He commenced an examination in a brook near the mines, and was soon rewarded by the discovery of a spherical mass of gold, of the value of more than a dollar; afterwards he found other small pieces. At the request of Mr. Wilder, I visited this spot a few weeks ago, and found that an individual conversant with the gold mines in the Southern States, and acquainted with the process of washing the metal from the soil, had just been examining the region now spoken of. The result was a conviction, that over several hundred acres at least, gold was common in the soil. In a bushel of dirt collected in various places, he found about three pennyweights of very pure gold. Mr. Wilder proceeded himself to exhibit to me an ocular demonstration of the existence of gold in the soil, by washing for it. From about six quarts of dirt, taken a foot below the surface, we obtained (although not very skilful in manipulations of this sort) twenty or thirty small pieces weighing about seven grains. Indeed, by the aid of my knife, I picked two or three pieces from the dirt.

The iron ore is in beds in distinct talcose slate; and a considerable part of the ore is the brown oxide, and contained in a porous quartz. In this quartz, were found several spherical pieces of gold, scarcely larger than a pigeon shot. Whether it exists, as in the Southern States, in finer particles in the yellowish iron ore, has not been ascertained. But specimens of the quartz and iron at this place cannot be distinguished from what is called gold ore at the gold mines in Virginia, and North Carolina. Indeed, a suite of specimens from the Somerset iron mine, could not be distinguished, except by labels, from a similar suite from the south.

In every case in which gold has been found at this place, in the soil, it was accompanied by more or less of iron sand, and some distance north of the mine, neither could be found; but how far to the South and East it occurs, has not been ascertained. I am inclined however to believe, that the gold at this locality, will be found to be always associated with the iron.

We were told at Somerset, that several years ago, a mass of gold was found in the bed of Deerfield river, three or four miles to the south of the mine, which was sold for sixty eight dollars, and we had no reason to doubt the statement. Certain it is, that a few years since, a piece was discovered by Gen. Field, weighing eight and a half ounces, in New Fane, a town twelve or fifteen miles east of Somerset.

Upon the whole, it appears to me that the facts above stated justify the conclusion, that there exists a gold region in the lower part of Vermont, of considerable extent and richness. It may be found to be very extensive, and probably it is not confined exclusively to the talcose slate formation; for New Fane, I believe, contains but little of this rock. The region west of Somerset is little known—the iron mine there, lies at the foot of the Green Mountains, and it is chiefly a mountain wilderness for sixteen or seventeen miles west of this spot.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

Saturday, August 24th, 1833.

Mr. David Haggerston, from the Society's Garden, Mt. Auburn, Dahlias—*Helianthiflora*, Hurd's Favorite, *Coccinea* superb, Semi Double Plum color, *Flora bunda*, Double Maroon, Eclipse, Double Buff, Craft's dark Maroon, Ignessius, Pink and Purple, Nuttallii, *Dolichos lablab*, *Petunia nyctaginiflora*, *Cacalia coccinea*, *Schizanthus pinnatus*, *Zinnia multiflora* and *elegans*, *Iberis umbellata*, Var. *purpurea* and *alba*, *Oenothera lindleana*, *Hibiscus vesicarius*, *Ageratum mexicanum*, *Delphinium ambiguum*.

Thomas Mason, Charlestown Vineyard, variety of Dahlias and other flowers.

S. Walker, Roxbury, Dahlias—*Læ* Brilliant (yellow), Squibb's pure Yellow, *Romulus*, Foster's Incomparable, Barrall's Susannah, *Coccinia speciosissima*, Colvill's perfecta, Dennisii, Hall's mogul, Well's royal lilac, Eclipse, &c. &c. &c.

EXHIBITION OF FRUIT.

Apples. By Mr. E. M. Richards, Hagloe Crab, Cox No. 13; and the Benoni, of most beautiful appearance and excellent flavor—it is pronounced one of the best apples of the season. By Mr. E. Sparhawk, Brighton, a very large Apple, not ripe, name unknown. By Mr. John A. Kenrick, Kenrick's red Autumn, unripe, and three sorts unnamed. By Mr. P. P. Spaulding, Chelmsford, Spaulding's Early Seedling, a beautiful apple of a dark red color never before exhibited, rather over ripe, but thought to be a very fine summer fruit.

Pears. By Col. Wilder, one of the pears called in Boston market the "Catherine," but not the Rousselet hatif. of Duhamel or of Cox—no doubt a foreign fruit the true name of which is lost. By Samuel Downer, Esq. St. Ghelien, from the London Hort. Society, very fine. By Doct. B. Shurtleff, Jr. "Queen Catherine," another foreign fruit with a local name. By Mr. John E. Kenrick, Preble's Beurre, another foreign fruit the true name of which is not positively known, deserves extensive cultivation.

Plums. By E. Bartlett, Esq. Bolmar's Washington, *Violette Reine Claude*, Yellow Gage, Italian Damask, and one unnamed variety. By John R. Kenrick, Blue Gage, and one variety unnamed. By Col. Wilder, Green Gage and Prince's Imperial Gage. From the Garden of Mr. Cruft, Boston, Bolmar's Washington, and one fine variety unnamed. By S. Downer, Esq. Bingham Plum, Green Gage, and Yellow Gage. By Mr. C. Cowen, fine Plums, name unknown. By Mr. Pond, Cambridgeport, White Gage, and Pond's purple, a fine new variety recently brought into notice. By B. V. French, Esq. Prince's Imperial Gage, Bolmar's Washington, Smith's Orleans, *Violette Reine Claude*, and one unnamed variety. By E. Vose, Esq. a basket of beautiful Green Gages. By Thomas Mason, Charlestown, Bolmar's Washington, White Gage and Green Gage. By R. Manning, Green Gage, Newton's Yellow Gage, Old Orleans, Peach Plum, Imperial Purple, Yellow Gage Elfrey Cox No. 6, Italian Damask, Washington, Peters's Large Yellow, Prince's Imperial Gage, Petit Mirabelle and four unnamed varieties.

Peaches. By Mr. Mason, Royal George, and Kensington. By Mr. Cowen, Coolidge's Favorite.

Grapes. By Mr. Tidd, Roxbury, five bunches

of Grapes of enormous size, three of which called the Horatio, but supposed to be the "Nice," weighed 6 lb. 7 oz. 3 lb. 7 oz. and 3 lb. 11 oz.; two bunches of Black Hamburg weighed—one 2 lb. 13 oz.—the other 2 lb. 5 oz.

Those gentlemen who presented Bolmar's Washington Plum, are respectfully requested to send specimens from the same trees to the Hall on Saturday next.

For the Committee,

ROBERT MANNING.

CORN AND OATS.

RIPE Indian corn in bunches was gathered on the premises of Mr. Isaac Hill in this town, Aug. 7. This corn was planted in the month of May, about the same time as was a field of oats of about one and half acre on land of Mr. Hill. These oats were reaped on the 16th and 17th of the present month—about ten days after the gathering of the corn. They were as fine a specimen of standing oats as the writer has ever seen—the largest he ever recollects that did not fall down before ripening. It is thought that somewhat less than one and a half acre will yield nearly one hundred bushels. The corn was from seed raised at Montpelier, Vt. the last year; it is of eight rows, and although smaller in the ear and stalk than the common twelve rowed corn raised here, it is thought will yield nearly as much to the acre. If this corn will come to maturity in the same time as will a crop of oats, it must be an object for farmers who cultivate corn on ground where the crop is endangered by early or late frosts, to procure the same early kind instead of the common kind for seed.—*N. H. Patriot*.

MULBERRY.

I wish to communicate a fact in relation to the propagation of the white mulberry, which I think is worthy of notice. During the season of feeding the silk worm, I trimmed my trees very liberally, yet I found it necessary in August to give them a second pruning. The branches separated were of *this season's growth*, and by way of experiment they were placed on the ground in the usual manner of setting out cuttings. In a short time the buds began to open, and have now sent forth branches from half an inch to two inches in length, containing from two to six leaves each. If the season is favorable, they will not only form buds for next year's wood, but gain sufficient firmness to endure the winter. Would it not be the most economical and expeditious mode of increasing a mulberry orchard, to pursue this course. Raising trees from the seed is frequently precarious; and if cuttings set in the *spring* will grow to the height of twenty or thirty inches, they will, by getting a start in the *fall*, far exceed the second year's growth from the seed, which rarely reaches four feet. "Cut and try."—*Northern Farmer*.

To Fatten Hogs. Shut them up, the fore part of September; feed them with dry peas, or corn; give them raw potatoes, but no drink. The grain creates an inward fever; the animal being uneasy from thirst, will chew the potatoes fine, eat them slow, and get the substance of them as well as if boiled. This has been my practice for years past. I give them, first, as much grain as they will eat; and after that, each grown hog will eat from six to eight quarts of potatoes per day. Brother farmers, do not dispute me till you have tried it yourselves, for I know it is so.—*Northern Farmer*.

GRASS AND APPLES FOR SWINE.

THERE is no question but that some farmers fatten their hogs at half the expense that it costs others. Travel almost any considerable district of our country, you will find at this season of the year one half of the swine running in the streets, and fed on nothing but thin swill. As soon as the corn is gathered, these pot-bellied and meagre creatures are shut up in pens, and fed on unbroken corn until they are fat. In this way we have known farmers to feed away their whole crop of corn, and obliged to either buy more corn or kill them not sufficiently fattened. Other farmers will keep their swine in a thriving growing condition through the summer, and when the time comes to shut them up to be fed on corn, they are more than half fat. They thus save the greater portion of their corn for family use and to sell.

The celebrated agriculturist, Arthur Young, Esq. pastured, in 1776, sixty hogs of various sizes, on only two acres of clover. They kept in good condition, and grew remarkably fast. In connection with feeding on sweet apples, many farmers in this country have entered extensively into the plan of fattening their hogs on grass. If a shady, comfortable and clean pen, into which the apples are thrown, is made in a clover field, the hogs will remain in it the greater part of the time, and thus much manure may be saved. Unless the orchard contains a greater proportion of sweet apples, this plan is better than to turn the hogs into the orchard. It will often happen that large quantities of leaves and other suitable substances may be obtained near the pen, and which may be carted into it with comparatively little trouble.—*Genesee Farmer*.

BURDOCK ROOTS FOR HOGS.

WE were told the other day by a friend, that the roots of the common Burdock are eaten with great avidity by Hogs.

He states that he has put an ear of corn by the side of one of these roots, and the hog seized upon the root first, and would not touch the corn until the root was entirely devoured. If all hogs are as fond of it as were these, this troublesome plant will gain in reputation.

It already has much honor in the domestic practice. Its leaves being excellent in some cases of sickness, and its seed digested in gin is a good remedy in Rheumatism. Its burrs are famous for getting into the wool of sheep, and making the good housewife scold when she manufactures it.

Hogs are also very fond of the common Knot GRASS, [*Polygonum Aviculare*, L.] which grows about neglected places, door yards, &c.; and it would be well to grub it up and put it to a good use, by converting it to Pork.—*Maine Farmer*.

Female Industry. Yesterday, two country-women were peddling whortleberries in the street, at four cents a quart. They remarked that they had travelled with them seventeen miles, had been out all night, and were anxious to return home. Though they had no very great claims to beauty, yet the thought struck us forcibly that they were already, or might easily be converted into, first rate wives. A woman who will pick whortleberries all day, ride all night to carry them to market, and lay out the avails for something for the comfort and convenience of her family, is above rubies. We wish the number was ten times multiplied, and above all things we most ardently pray that such a woman may be forever exempt from a drunken husband.—*Hartford Review*.

From the Genesee Farmer.

TIME OF SOWING GYPSUM, OR PLASTER OF PARIS.

My attention to this subject is called at this time, by the circumstance of seeing several farmers last week sow plaster on their grass lands. It is so different as to time from what is the common, and what I call the correct practice, that it may be useful to spare a few moments in the consideration of the subject. The first I saw, was sowing it on a grass field affording a fair bite to cattle, and of course a large portion of it would never reach the ground, where I conceive plaster ought to lie. But what struck me as most remarkable in this case, was, that the field in which the plaster was sowing was filled with cattle, horses and sheep, who would necessarily eat a large portion of it, and which would then be lost to the farmer; but what was still worse the eating of so much plaster must be injurious to the animals that are obliged to feed on it. On this subject there can be no mistake; and if this man had lost a cow, horse or a few sheep, at this time, it would have been attributed to any but the right cause. Water dissolves a small portion of plaster, the remainder hardens into an indissoluble mass; and those who are experienced in rat killing take advantage of this circumstance and administer it for the destruction of that animal. This man ought to have his salad for dinner well sprinkled with plaster, and become practically acquainted with both its taste and effects.

On going a little farther, I saw another farmer sowing plaster in a field well covered with clover, more than half knee high. By far the largest portion of it must therefore lodge on the expanded and broad leaves of the clover, and very little of it would ever reach the ground. Plaster, as a manure, has been used about thirty years; and it argues bad farming that the proper time for sowing it is not yet determined. I hold that the practice of sowing it on the ground before the starting of vegetation in the spring, and upon the half grown plant, cannot both be right. I apply plaster as I do every other kind of manure; I spread it on the surface of the ground, expecting that the rains as they descend will dissolve successive portions of it, and carry these portions into the earth, where the roots of the plants which come in contact with it will either absorb or be stimulated by it, to a more vigorous growth. Besides, such portions of it as remain undissolved on the surface of the ground have the peculiar property of attracting moisture during the decomposition, of which the plants in the vicinity can avail themselves. I am likewise anxious to reap this second advantage.

It is Judge Buel's opinion that plaster to be useful ought to be sprinkled on the ground very early in the spring, before vegetation begins to revive—the spring and the summer rains gradually dissolve it, and it yields out its fructifying qualities as the plant requires it during the season. It appears to me also, from the slight knowledge I have of vegetable physiology, that sowing plaster on the broad and expanded leaves of the clover is interfering with its growth and doing it a positive injury. The leaves are denominated by botanists the lungs of plants—they fulfil in the vegetable economy what the lungs do in the animal—they are the organs of respiration, and air is as necessary to the first as it is to the second.—They imbibe through their upper surface carbonic acid, and give out oxygen from their lower. To do this freely almost all

plants are supplied with leaves which are very large in proportion to the other parts of them, that their respiration may be easy and thus conduce to their speedy evolution.—When the upper leaves of the clover are then covered with fine plaster, which the first rain or dew converts into an adhesive paste, it must naturally interfere with the respiration of the plant, for three fourths of its upper surface is covered with this coating. Besides it must be to it a source of irritation, and although a small quantity may be absorbed into the plant in this unnatural way, still it is an interference with respiration, which retards its growth and under any circumstances it does not require. Where, too, is the use in sowing plaster in clover more than half grown? It can be of no service to a subsequent crop, because a very small portion of it only will reach the ground, and the clover having already attained a large size, its own growth does not require it. The truth of the matter is, some farmers sow their plaster at the increase or decrease of the moon, and do not reason any farther on the subject. These facts go to show how very ignorant we are of the profession we follow, and how necessary it is that we have some settled rules to guide us; every operation shows a want of system, and thus the success of farming is left too much to chance.—Upon this important subject it is high time that all the light that can be borrowed from the sciences of botany, geology, chemistry, &c. should be drawn to it, and that the darkness which now surrounds it be dispersed. To do this effectually, the young mind must be prepared for it by education. The reasoning powers once developed, the young farmer will have as sure a guide to bring his labors to a successful issue, as is permitted to the human understanding, to comprehend the mysteries and unfold the laws of nature.

AGRICOLA.

From the Lansingburgh Gazette.

MR. EDITOR—I have sent for publication in your paper, if you think they merit it, two short extracts from a late number of the London Horticultural Register, the first is a plan of M. Saul, for

LABELS FOR PLANTS.

Various plans are made use of, for fixing the names to different plants; but I think none will be found cheaper and more readily obtained, than the following, which may be made of waste pieces of tin-plate. The polish of the tin may be taken off, by applying a weak acid, as cream of tartar, or an apple cut into, and rubbed upon it. Then with a common pen and ink write the name; the ink will sink into the pores of the metal; afterwards run over the writing a little boiled linseed oil, which will prevent its being defaced. If the name is ever required to be taken out again, it may speedily be done, by plunging the label into a strong acid, which will clean off both the ink and oil. The labels may be clipped to any pattern, and stuck upon a stick, or hung upon the side of the pot.

The second article is F. F. Ashford's plan of forcing Bulbs, to cause them to flower in the winter. Yours, &c. LANSINGBURGH.

FORCING BULBS.

Early in October take your bulbs, as Narcissus, Tulips, Hyacinths, &c. having previously provided a quantity of mould, composed of

Two barrowful of well decomposed hot-bed dung,

One barrowful of fresh loam,
One do. of vegetable or leaf-mould,

One quarter of a barrowful of fine sand. These are to be well chopped, and mixed together; then lay the compost in an open shed, to dry a little before using. About the second week in October, put the bulbs in the above soil, in pots proportioned to the size or sort of the bulb. Fill all the pots with soil, and shake it down, but do not press it with the hand before commencing to plant the roots; then lay some clear sand on the soil in the middle of the pot, and placing the bulb on the sand, gently press it down till within half an inch of the top. Care must be taken not to press with sufficient violence to injure the bulb, yet it must be left firm in the pot; for on these two things much depends, with regard to their growing freely.

After they are potted, and named or numbered, place them in a cucumber or melon frame, prepared after the following manner:—Take out the soil, and lay on the old bed about two inches thick of fine ashes, level and make them pretty solid, on the top of this lay a quantity of sifted ashes, in which plunge the pots, making the ashes as firm about the pots as possible. After this is finished, cover the whole to the depth of eight or ten inches with dry light soil. Always choose a dry day for the purpose, and let every thing be dry that is used about plunging; or the bulbs will be liable to perish. Give air at all times in fine mild weather, but allow no wet or frost to enter the covering soil: at nights, the lights must always be on and in severe weather closely covered down with mats; but if the nights are mild the glasses may be tilted, to allow a little air.

In January, take them out of the frame, wash the pots, carry them to the stove for flowering; and give them regularly a moderate supply of water, to assist them to flower strong. As the flower stalks advance in growth, tie them to neat green or white sticks; and if treated as above they will flower beautifully. Crocuses planted four or five in a pot, flower well when treated as above.

From the Genesee Farmer.

DISEASE IN CALVES.

In this paper of March 9, (see page 77.) we published a communication from "A Subscriber," giving an account of a disease by which he had lost several calves. They were taken lame at first in one of the hind legs, and generally died in about from 24 to 48 hours after. On opening them, the hind quarter above the gambrel joint appeared mortified and rotten. In some the intestines appeared affected in the same way. The blood before death appeared thin and watery. The editor of the Wyoming (Pa.) Republican copies the article and appends to it the following remarks, which we think, afford another proof of the benefit derived from a liberal feeding of salt:

"An observing and intelligent farmer informed us that a few years since he lost several calves by the disease to which the above article relates. He was advised by a neighbor to mix pulverized brimstone and salt, in equal quantities, and feed it to his calves during the winter, occasionally, perhaps once a week. He adopted this mode of treatment and kept his calves in a warm pen or shed, and has not lost one since by disease. It is the opinion of our informant that the disease cannot be cured; but experience has fully satisfied him, that a mixture of brimstone and salt is an infallible preventive of it. Several of the farmers in this neighborhood have treated their calves in this way with equal success.

From the Louisiana Register.

DISEASE IN HORSES, CATTLE, &c.

A DISEASE very destructive to horses, cattle and hogs is now prevailing in the lower part of Baton Rouge and the adjoining parish of Livingston. It first appears by swelling, which is not confined to any particular part, but generally under the joints of the head and neck, and between the fore legs. In many cases the animal dies as soon as the swelling appears.—Some live twenty-four hours longer, and some have been cured by the use of medicines, the first application of which was made even after one day from the first attack. We have not heard a name for the disease. The swelled parts on being opened, before or after the animal is dead, discharge a slimy, yellowish fluid. In some cases the discharge is white.—The only remedies we have heard of being used are bleeding, calomel, and after calomel, active purgatives. Horses are first bled to the quantity of a gallon, or gallon and a half; about an ounce of calomel, mixed with bread or any other convenient article to form a bolus, is next administered, and after a lapse of two or three hours, some active purgatives are given. The animals said to be out of danger as soon as the bowels are loosened. We have not heard of any mode of treatment for either cattle or hogs. Some cattle on being opened were found to have the gall bladder very much enlarged.

Several farmers have lost all their horses; some as many as six or eight. It is the opinion of some that the hogs take the disease from feeding on cattle that have died of it.

The above we have learned from persons who have lost stock by the disease. We would be obliged if any of our friends would furnish us with something in detail in relation to the disease and the best mode of treating it.

POISON FROM NEW HONEY.

A son of nine, and a daughter of six years, and only children of Samuel York of Farmington, died a few days since in consequence of eating new honey. They lived about thirty-six hours.

It is, perhaps, not generally known, that honey recently gathered by bees at a certain season of the year, from the flowers of some poisonous plants, possesses their deleterious qualities in a highly concentrated state, when fresh, and may prove fatal, if taken in sufficient quantity. It has been ascertained, that the poisonous effects of some plants, as for instance, the Lambkill, so called, depend upon a certain agent, named by chemists, *Prussic Acid*. It is also found that this acid very soon loses its hurtful properties by decomposition; so that honey containing such an agent at first, would of itself become pure in a short time, being suffered to remain undisturbed. Occurrences of death from this cause, are no doubt exceedingly rare. Though one such fatal instance, among hundreds who might at other times partake of this delicious substance without injury, ought to prove a sufficient caution to deter from the use of it, at that season of the year, which might create a liability to injurious if not fatal consequences.

From a consideration of the embarrassments and difficulties, which at first presented themselves, in judging correctly of the most probable cause of death in these two cases, in so very sudden and surprising a manner, it is quite reasonable to conjecture, that such instances may have happened oftener, and no satisfactory cause could be assigned for the strangeness of the symptoms and the fatal consequences that followed.—*Kennebec Jour.*

From Goodsell's Genesee Farmer.
IVY.

An ounce of preventive, better than a pound of cure.—I noticed an article in Goodsell's Genesee Farmer on the subject of poison by ivy, and as it is one which interests farmers at this season of the year, being about commencing their mowing, I am induced to state for the benefit of others what I have learned on that subject. In the year 1817, I was engaged in clearing up a piece of low land where much of the ivy grew, and having a number of times before experienced the sad effects, by nearly losing the use of both hands and feet, I approached my labor very cautiously, watching every step lest I should touch my enemy. I had at the same time a man to work with me, who, seeing my fearful situation, told me to "chew the leaves and swallow the juice, and I need not be afraid of being poisoned." I hesitated, supposing the remedy would be worse than the disease; but from his repeated assurance that it would not hurt one, and having his example in the case, I ventured. The consequence was, I labored amongst it for several days without experiencing the least inconvenience. From that time to the present, it has been my practice when exposed to the effects of the vine, to chew the leaves, and have never been poisoned when I have done so.

M. ATWATER.

Brighton, 8th mo. 17th, 1833.

NOTE ED.—The vine above alluded to, is the *Rhus toxicodendron*, of L. and the variety *radicans*, a creeping vine from which many small roots protrude. It is frequently found in meadows upon stumps, into which the roots penetrate.

From the Kingston, (U. C.) Chronicle.

HYDROPHOBIA.

A VERY affecting account of the effects of this terrific disease has been communicated to us, which occurred in the family of Mr. Moss, a respectable farmer, residing near the village on the river Trent. While Mr. M. and family were sitting at home, a dog, belonging to the house, suddenly flew at his master, and bit him very slightly in the hand. He then attacked a daughter about 12 years old, and bit her in several places. A son, a young man of 18 or 20, endeavoring to beat off the mad animal, received a wound upon the lip, and how it was inflicted in the confusion and terror of the moment, whether by himself with the cudgel he was using, or by the dog, he cannot tell. The daughter (an interesting young woman) lingered along for several days in the horrors of insanity, and died. The father is now in such a state of phrenzy, that he is obliged to be chained; and the young man, laboring under the agonizing apprehensions that he is also infected with madness; his mind haunted with the death of his sister, and the terrifying situation of his father, is in a condition scarcely less pitiable than that of the unhappy maniac.

A number of cattle we are informed, have been bitten at Belleville.

Something New. The Concord (Mass.) Gazette mentions that on Wednesday last, about 200 ladies, organized as a "Female Charitable Society," formed a party for the purpose of gathering berries. In the evening a Fair was held, at which they sold their berries at auction for the handsome sum of \$40, which sum is to be appropriated to the objects of the Society. "This is one way of raising the wind."

CURIOUS FACT IN THE ECONOMY OF BEES.

M. DE JONES DE GELIEU, pastor of the churches of Colombier and Auvier, in the principality of Neuchâtel, Switzerland, in a work translated into English under the title of 'The Bee Preserver, or Practical Directions for Preserving and Renewing Hives,' affirms a very important and singular fact with regard to the economy of bees. It is, that 'when two or three distinct hives are united in autumn, they are found to consume together scarcely any more honey during winter than each of them would have consumed singly if left separate.' In proof of this remarkable circumstance, the author states a variety of experiments, to which he had recourse; and all of which led uniformly to the same conclusion. And, indeed, he shows positively, by a reference to upwards of thirty hives, six of which had their population thus doubled, that the latter do not consume more provision during winter than a single hive does, and that, so far from the bees suffering from this, the double hives generally send forth the earliest and best swarms. The translator, says the Quarterly Journal of Agriculture, who is a lady of great accomplishments, and habits of correct observation, has practised in Scotland most of the plans recommended in the original work, with the same results as the author.

HINTS TO MECHANICS AND WORKMEN.

If you want to avoid the diseases which your particular trades are liable to produce, attend to the following hints:

Keep, if possible, regular hours. Never suppose you have done extra work, when you sit up till midnight, and do not rise till eight or nine in the morning.

Abstain from ardent spirits, cordials and malt liquors; let your drink be that of Franklin, when he was a printer—pure water.

Be particular in preserving your skin clean, by frequent washing of your hands, face and mouth, before each meal, and of your whole body at least once a week, and by combing and brushing the hair daily. Always have a fresh air in the room in which you work, but so that you will not be in a draft.

Take a short time in the morning, if possible, and always in the evening, or towards sundown, for placing your body in a natural posture, by standing erect and extending your chest and limbs by a walk where the air is fresh.

If confined in doors, let your food consist, in a large proportion of milk and bread, and well boiled vegetables. Meat and fish ought to be used sparingly, and only at dinner. You are better without coffee, tea, or chocolate. If you use any of them, it ought not to be more than once a day.—*Journal of Health.*

"Pon my soul 'tis true—what will you lay it's a lie."

"*An Itch for Business.*" The Hartford Review says, a pedlar from Connecticut lately travelled through Virginia, shaking hands heartily with every one he met, whether they purchased or refused his merchandise. Directly it was discovered, that to every one with whom he had shaken the friendly hand, he communicated the itch. Immediately after this discovery, another pedlar, his partner, came along with a good stock of sovereign itch ointment. It is perhaps needless to say that he made large sales at a good per centage.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 28, 1833.

FRUIT STEALING.

THE following is an abstract of the Statute of this Commonwealth passed in 1818 for the prevention of trespasses in Orchards and Gardens, &c.

Sec. 1. If any person enter upon any grass land, orchard, or garden, without permission, *with intent* to cut, destroy, take or carry away any grass, hay, fruit or vegetables, with intent to injure or defraud the owner: such person shall, on conviction before a justice of the peace, forfeit and pay for every such offence, a sum not less than two, nor more than ten dollars; and be also liable in damages to the party injured.

Sec. 2. If any person, having entered as aforesaid, shall take without permission, and with intent to injure and defraud the owner, any grass, hay, fruit, vegetable or shrub, cultivated for ornament or use; such person shall, on conviction, by indictment or information before any court of Common Pleas, forfeit and pay a sum not less than five, nor more than fifty dollars, for each offence, and be further liable to the party injured, in damages, equal to three times the value of the grass, hay, fruit, vegetables, or shrubs carried away.

Sec. 3. If any person, having entered as aforesaid, shall, without permission of the owner, and with intent to injure him, break, bruise, cut, mutilate, injure or destroy any fruit-tree, tree for ornament or shade, or shrub cultivated for ornament or use, such person on conviction, as in Sec. 2, shall forfeit and pay a sum not less than ten, nor more than one hundred dollars.

Sec. 4. If any person shall commit any of the above trespasses on the Lord's day, or in the night time, (that is, between sun setting and sun rising,) he shall be liable to pay double the above penalties. And all prosecutions for breaches of this act shall be commenced within one year from the time the offence shall be committed, or the penalties shall have accrued, and not afterwards.

Though such is the law of the land, custom sanctions, or at least connives at its violation; and in too many instances it may be considered as a mere dead letter. Many boys and young men, "children of a larger growth," who would shrink from, and hold in abhorrence any other kind of theft, appear to consider "water-melon frolics," or nocturnal depredations on their neighbor's orchards rather as indications of manhood, spirit and enterprise, than as serious offences against the laws of the land, the dictates of morality, or the requirements of religion.

Such, however, is not the case among the more enlightened nations of Europe. In England *man traps* and *spring guns* cause the paltry trespassers on orchards or fruit gardens to pay with their limbs or lives the forfeit of their offences. In France and most of the more civilized nations on the continent, *public opinion* is sufficient guaranty against any trespasses or pillage which would injure, deface or wrongfully appropriate the fruits or flowers of public or private gardens. Touch not, taste not, handle not, without leave of the owner, is the law of the land, which the meanest and most unprincipled beggar or thief, would esteem it sacrilege to violate.

What can be more annoying than the situation in which evil doers of this description not unfrequently place the cultivators of fruit. A man by dint of much labor and expense has obtained what he hopes and believes will prove a new and valuable kind of apple or pear, or some other sort of fruit. He has planted it, and watered it, and manured it, and bestowed upon it all the care belonging to an almost filial affection, waiting for it to *show fruit*, that he may ascertain the value of the variety, and judge whether it is advisable to propagate from it. But just before its product arrives

at that degree of maturity, which may enable him to form a correct estimate of its value, along comes a brainless, heartless biped, and *steals the fruit*, which could alone indicate the value of the tree on which it grew, and forces the disconsolate owner to wait another year, before he can know whether his favorite is worth its weight in gold or a mere lumberer of the ground! Nor is this all. The owner of valuable fruit trees, finding he has no security for that kind of property, relinquishes their cultivation in despair, and the public is thus injured beyond calculation by the trespasser, who for the sake of two or three green apples or half ripe pears, does more injury to the community, than many a perpetrator of crimes, which doom the offender for life to the State Prison.

Our Subscribers in Canada and New Brunswick. We are now thrown into a quandary respecting Subscribers for the New England Farmer out of the States. Our Postmaster General's instructions now are to pay postage of papers before they cross the lines; this will make the following arrangement necessary. Subscribers in the Canadas and New Brunswick, will please remit the amount of their bills enclosed this week to this office, or to the following gentlemen.

QUEBEC, (L. C.) Messrs. Neilson & Cowan.

MONTREAL, (L. C.) Geo. Bent, Druggist.

ST. JOHN, (N. B.) Wm. O. Smith, do.

We have taken some liberty here which we hope will be excused, and a compliance will enable us to continue the paper. The postage for a weekly paper is 80 cents a year to the lines, so that this amount will be added to the bills, and it is earnestly requested that all our subscribers upon the reception of this notice intimate to us or our agents their wish as to the future.

Those who owe for years past will recollect their bills will be at \$3 per year, and for vol. xii. \$2.50 in advance. Such persons will please remit \$6 to this office, which will cover the postage. If our subscribers in New Brunswick prefer we should send their papers to St. John by packet, they will please retain the amount of their postage.

We would improve this time to return our sincere thanks to gentlemen of the Provinces who have so liberally patronised our unworthy hebdomadal, and to such as will continue it we will feel particularly obliged.

ITEMS OF INTELLIGENCE.

A disease prevails among horses and neat cattle, in the county of Philadelphia, which destroys them very suddenly. A letter says—"My cows and horses were apparently in health three hours previous to death, and in every instance they were found dead without exhibiting any symptoms of disease. I am told, however, that a horse of one of my neighbors exhibited uneasiness and a kind of vertigo, a few hours previous to death, but that no symptoms of disease were visible in the morning—the animal having died in the evening."

Anti-Tobacco Society. Last Wednesday evening a meeting was holden at the First Parish meeting-house, for the purpose of forming a society to discourage the use of tobacco. On this occasion, a dissertation on the character and the effects of tobacco upon the animal system, was delivered by Dr. Rufus Longley; and a lecture was also delivered by the Rev. Mr. Perry, on the physical and moral evil arising from the use of this weed. Being absent from town, we were deprived of the pleasure of listening to the dissertation of Dr. Longley, and of a considerable portion of Mr. Perry's lecture.

These performances are both highly extolled by those who were present, and on whose taste and judgment we rely. Certain it is, that so much of the lecture as we heard, was highly meritorious. For want of time, Mr. Perry was obliged to postpone the delivery of a portion of his lecture until another meeting. A constitution was read and signed by twenty-six persons, and the meeting was adjourned to next Thursday evening, when it is understood that Mr. Perry will conclude his lecture—and when the officers of the society will be chosen. Thanks were voted to the lecturers, and copies of their performances solicited for publication.—*Haverhill Gaz.*

No England Convention. In consequence of the political Convention at Worcester, on the same day appointed for the N. E. Convention, the Executive Committee have resolved to postpone the meeting which was appointed on the 4th Sept. to the 2d day of Oct. next.

It cannot be too often repeated, that the business which is contemplated by the N. E. Convention, is so general in its nature, as to exclude no sect, or party.—The Jackson and Anti-Jackson—the Tariff and anti-tariff—the mason and anti-mason—the orthodox and heterodox, may all meet, and unite their labors for the physical and moral good of society, without injury to any honest purpose, of any party. Our object is to correct wrong impressions and deceptive laws, which work inequality, to the great injury of the working classes.—*Boston Artisan.*

Mr. Brooks, Editor of the Portland Advertiser, in his letter concerning the prospects of New Orleans, does not state, in giving the mileage to the principal rivers which pour their treasures into New Orleans, the extent to which the Missouri is navigated by steam. This we deem of some importance, inasmuch as there is not, in general, an accurate knowledge on this subject. The American Fur Company have sent their steamboats, twenty-one hundred miles above the mouth of the Missouri; and in high water, steamboats of light draft can ascend two thousand six hundred miles. The Mississippi is navigable by steam between six and seven hundred miles above St. Louis. These rivers pass through an exceedingly fertile country; and when a just system of Internal Improvement shall be carried into operation, not only New Orleans and the great valley of the Mississippi will be benefited, but every portion of the United States will feel the invigorating influence of such a course.

Two thousand six hundred miles! What a world there is in our own country of which we know little or nothing! There, is land enough for all England and France to live and be happy in.—*St. Louis Times.*

A Grand Railroad Spectacle. The locomotive engine, on the Baltimore and Susquehanna Railroad came in on Sunday evening, a little before seven o'clock, with fourteen cars in its train; averaging, as nearly as we could judge, thirty persons to each car—making a total of 420. These persons were mostly those who had been to the Camp Meeting near Reister-town, and were on their return. The sight was truly grand! The movement of the long train, as it were by magic, at an easy speed, at the rate of about sixteen miles to the hour, around the spurs of hills, following the serpentine course of the wild and tumbling stream, the banks and rocks of which in the vicinity of every settlement were enlivened by spectators—the younger with smiling faces, and the older with a kind of wonder and astonishment, at the reflection, no doubt, at the change which two or three years, with industry and enterprise, had effected in their rocky and woody neighborhood. The salubrity of the atmosphere was beyond all comparison—and the pleasantness of the day—the mild refreshing breezes—and the quiet and orderly conduct of every passenger—rendered the scene, and every thing relative to it, most truly delightful.—*Marylander.*

BOSTON FANEUIL MARKET, Aug. 28, 1833.

Vegetables. Early Potatoes, 50 cts per bushel; Peas, 25 cts per bus; String Beans, 75 cts per bush; Squashes, Scollop, 12½ cts pr doz; Winter Squashes, 3 cts per lb.; Cucumbers, 6 to 8 cts. pr doz; Turnips, Onions, Beets and Carrots, 64 cts pr bunch; Shell Beans, 10 cts pr qt; Saba Beans, 25 cts. per qt; Green Corn, 12½ cts pr doz; Tomatoes, 12 1-2 cts per doz.; White Portugal Onions, 1 25 cts. per bushel.

Fruit. Pears, \$2 per bushel; Apples, from \$1.00 to \$1.50, according to quality; Whortleberries, 6 cts pr qt; Blackberries, 12½ pr box; Peaches, from \$2 to \$4 per bus; Musk Melons, 1s to 2s per piece; Green Gage Plums, a superior variety, 25 cts. per doz.; Horse Plums, 25 cts per pt.

COUNTRY SEAT FOR SALE AT AUCTION.

WILL be sold at auction on Monday the 2d day of Sept. next at 4 o'clock P. M. (if not sold previous at private sale), the House, Barn and out Buildings, with about one and a half acre of land attached to the same, laid out as a garden, well stocked with every description of the choicest kind of fruit trees, all of which are in bearing. The House is two stories high, well furnished, with 4 rooms on the lower floor, besides the kitchen 9 good chambers, 2 wells of water, good cistern for rain water: the Barn is large, and in perfect repair.

This situation is in Dorchester on the road leading from Roxbury to South Boston, three miles from State street, in the immediate neighborhood of the late Gov. Eustis's estate, and adjoining that elegant situation formerly owned by Cornelius Coolidge, Esq. and now owned by Charles Taylor, Esq. The sale will be on the premises, where the conditions will be made known. The place can be examined any day previous to the sale, from 3 to 7 P. M. For further information, inquire of Jno. Swett, on the premises, or at No. 52, India Wharf.

jy 31

REAL ESTATE FOR SALE.

THE subscriber offers for sale his valuable Real Estate in the town of Palmelia, on the Black River, opposite the village of Watertown, in the county of Jefferson, state of New-York, consisting of a Saw Mill, Flouring Mill, with four run of Burr Stones in good orders, Machine Shop and Distillery, and is one of the best hydraulic privileges in the State.

Also, six small Dwelling Houses, with suitable out-houses. Also, one large two story DWELLING HOUSE, with a barn and all other out-houses attached to it that are necessary, with a garden extending to the banks of the river.

Also, about three hundred acres of first rate Land, lying over one mile on the river and road leading from Watertown to Brownville; about one half is under cultivation, and the remainder is good wood land.

The above property will be sold at auction on the first day of October next, (unless sooner sold at private sale,) in such parts as may suit purchasers. Two-thirds of the purchase money may remain two or three years on bonds and mortgages. Those who wish to make good bargains would do well to call and examine the premises. Any information that may be wanted can be had by applying to the subscriber, in Watertown.

J. FOSTER.

Jy 24

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Paeonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application.

Jy 17

PATENT GRATER CIDER MILL.

DANIEL LE LAND having purchased the patent of the above named Mills, would call the attention of Farmers and others in this vicinity, to the undersigned certificates of their merits, and feels confident that they are superior to any other in use, for grinding apples.

These Mills are drawn by one horse. Six, eight, ten, and twelve feet wheels are used, some with one and some two drums. They may be placed in a building, and so fixed as to grind upon the press, or into a trough. The following certificates will probably give the public some proof of their value.

"This may certify that we the subscribers have made use of Joel Farnum's Patent Grater Cider Mill, for three years past. We grind a cheese of cider in one quarter of the time we did in the old mill; it grinds better, makes more and better cider; we grind upon the press, and save the shoveling of the pomice, and the juice may be extracted in less time.

JOHN CLARK, 2d.

JAMES P. CLARK.

Medway, August 8, 1833.

"This may certify that we the subscribers, have used the above named machine for three years last past, and approve of the plan of grinding apples. We save one third part of labour and time in grinding and laying up a cheese of cider. It grinds better than the old mills generally do, the cider is clearer and contains less sediment; the cider is pressed out in less time, and the mills are kept in repair at less expense than the old mills.

AARON LE LAND.

JOSEPH P. LE LAND.

Sherburne, Aug. 9, 1833.

"This may certify, that I have assisted in the making of cider in the above named mills, and consider it a valuable improvement in the making of cider. At one time we ground and laid up, apples sufficient for eight barrels of cider, in forty minutes, by the watch. We save one half of the time, in grinding and laying up the cheese.

Sherburne, Aug. 9, 1833.

JOTHAM W. ROGERS.

For further particulars, apply to J. R. NEWELL, Agricultural Warehouse, where Mills are on hand or will be furnished at short notice, or to DANIEL LE LAND, Sherburne. Sherburne, Aug. 11, 1833.

WHOLESALE AND RETAIL ASH STORE.

ELIAB STONE BREWER, No. 414, Washington Street (South end) has received a general assortment of *Spring and Summer Goods*, among which are 100 cases English, French and American Prints of all prices and qualities—20 cases Petticoat Robes—1 case Cambric Muslins, some of which are very fine—1 case Cotton Cambrics do. do.—1 case White Lilies for lining ladies dresses—1 case Book Binders' Cambric for do. do.—3 cases do.—100 cases bleached and brown Sheet and Shirting, some extra fine—1 case Marseilles Quilts, from 8 to 10 quarters—5 cases London Rose Blankets, some of a very superior quality and large size—1 case Hearth Rugs—4 cases Chapp's spool 6 cord cotton, warranted—200 yards superior quality—5 cases Clark's do. at very low prices by doz. or case—2000 fancy boxes—a large variety of colored and black French Silks at very reduced prices—2 cases col'd Battiste—1 case black and colored Barage—4 cases French and London printed Muslins of new patterns and beautiful colors—2 cases three corded superfine Italianettes, black and fashionable colors—1 case common do.—1 case Plaid Palmgrim's super quality—1 case Pou de Soi a genteel article for ladies' summer dresses, 9d per yd—20 ps super mix'd, drab, and olive Merino Cassinetts for children's summer dresses—20 ps Rouen Cassimere with a large variety of superfine and fine Broadcloths and Cassimeres—20 bales Pelisse Wadding—3 cases superior Ticking—4 cases cheap do.—10 cases improved soft finished 4-4 Irish Linen, manufactured for the London market and imported expressly for the subscriber.

The above goods are offered for cash only at prices so extremely low as will make it an object for purchasers either by piece or yard to call and see. May 29

YOUNG MEN AND YOUNG WOMEN.

COBBETT'S ADVICE to Young Men, and incidentally to Young Women, in a Series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a Subject—268 pages, price 56 cents—for sale at the N. E. Farmer office, 52, North Market street. aug 28

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug 28

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Celebs, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. optf

BRIGHTON MARKET.—MONDAY, AUG. 26, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 520 Beef Cattle, 20 Cows and Calves, 4500 Sheep and 310 Swine.

PRICES. *Beef Cattle*.—No particular variation from last week—we quote about the same, viz.—A few very fine were taken at \$75 a \$6; prime at \$5 25 a \$5 75; good at 4 75 a 5 25; thin at 3 25 a 4 25.

Cows and Calves. Dull: very few only sold. We noticed sales at \$15, 19, 22, and 26.

Sheep.—Sales rather better than last week. We noticed lots taken at \$1 12, 1 25, 1 29, 1 37, 1 50, 1 67, 1 75, 1 82, 2, and 2 25. Some weathers sold at a higher price.

Swine.—One entire lot to close were taken at 5c; a lot of Barrows at 5½c and a lot of Sows, at 4½. At retail 5c for Sows and 6c for Barrows.

CLOVER SEED.

4000 lbs. Northern Clover Seed.—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

MISCELLANY.

FOREST WOOD.

BY THE AUTHOR OF 'CORN LAW RHYMES.'

Within the sun-lit forest,
Our roof the bright blue sky,
Where fountains flow, and wild flowers blow,
We lift our hearts on high;
Beneath the frown of wicked man
Our country's strength is bowing;
But, thanks to God! they can't prevent
The lone wild flowers from blowing!

High, high above the tree-tops
The lark is soaring free;
Where streams the light through broken clouds
His speckled breast I see.
Beneath the might of wicked men
The poor man's worth is dying;
But, thanked be God, in spite of them,
The lark still warbles flying!

The preacher says, 'Lord bless us!'
'Lord bless us!' echo cries;
'Amen!' the breezes murmur low,
'Amen!' the rill replies;
The ceaseless toil of wo-worn hearts
The proud with pangs are paying;
But here, oh God of earth and heaven!
The humble heart is praying.

How softly, in the pauses
Of song, re-echoed wide,
The cushat's coo, the linnet's lay,
O'er rill and river guide:
With evil deeds of men
The affrighted land is ringing;
But still, oh Lord! the pious heart
And soul-toned voice are singing!
Hush! Hush! the preacher preacheth,
'Wo to th' oppressor, wo!'
But sudden gloom o'ercasts the sun,
And saddened flowers below;
So frowns the Lord! but tyrants, ye
Deride his indignation,
And see not, in his gathered brow,
Your day of tribulation!

Speak low, thou heav'n paid teacher!
The tempest bursts above;
God whispers in the thunder: hear
The terrors of his love!
On useful hands and honest hearts
The base their wrath are recking;
But, thanked be God, they can't prevent
The storm of heaven from speaking.

A CHAPTER ON LOUNGERS.

ONE lounge takes up more room than two laborers.

Loungers are always unhappy themselves and their presence makes others so.

Loungers are invariably in mischief, because they have no other employ. Mice, rats, thieves, and borrowers themselves, are a less intolerable and destructive species of animals than loungers.

If you wish to injure your credit—*lounge*. No man of sense will ever trust you a sixpence, after having detected you in lounging.

Lounging should be classed among the great national evils that require to be removed. If nothing else can effect a cure, there should be established a great national anti-lounging society, with auxiliaries in every city, town, village, hamlet, and—*printing office*—in the country.

When do people first begin to visit the grog shop—the bar room—the porter house?—when they first learn to lounge. Lounging begets idleness, restlessness, impatience of restraint and neg-

lect of duty. Where do you hear vulgar and profane language? Among loungers. Who waste the precious hours of the Sabbath? Loungers. For what purpose were theatres and play houses invented? For the edification of loungers. Who loiter around ten pin alleys, billiard rooms, race grounds, and cock pits? Loungers. Why cannot slavery be abolished? Because loungers, who cannot earn their bread by the labor of their own hands, must be indulged in wringing it from the heart's blood of others. Who foment the wars that desolate the earth? Princely loungers, with whom campaigns are a game of hazard and amusement—whose dice boards are battle fields—whose chess-men human beings.

Why are all these abuses tolerated in this age of boasted light, and literature, and learning?—Because learned loungers have turned authors for their own and others' amusement, and deluge the world, not with their works but with their idleness; and because fashionable loungers read to drive away thought, not to promote thinking.

Honesty should not lounge—for lounging and paying seldom go together. Patriotism cannot lounge, for lounging is the nation's curse. Christian! dost thou lounge? Up, and be doing.—Whatsoever thy hand findeth to do, do it with all thy might.

A Lapland Wedding. The following is an account of the deciding on Marriage between young persons in Lapland:

It is death in Lapland to marry a maid without her friends' or parents' consent; wherefore if one bear an affection for a maid, upon the breaking thereof to her friends, the fashion is that a day is appointed for their friends to meet to behold the two young parties run a race together. The maid is allowed in starting, the advantage of a third of the race, so that it is impossible, except willing of herself, that she should ever be overtaken. If the maid overrun her suitor the matter is ended,—he must never have her, it being penal for the man again to renew the motion of marriage. But if the virgin hath an affection for him, though at the first running hard to try the truth of his love, she will (without Atalanta's golden balls to retard her speed) pretend some casualty, and make a voluntary halt before she comes to the mark or end of the race. Thus none are compelled to marry against their own will;—and this is a cause that in this country the married people are richer in their own contentment, than in other lands; where so many forced matches make feigned love, and cause real unhappiness.

An Actress's Apartment. My present apartment is so small, that I am all over black and blue with thumping my body and limbs against my furniture on every side; but then I have not far to walk to reach any thing I want; for I can kindle a fire as I lie in bed, and put on my cap as I dine; for the looking glass is obliged to stand on the same table with my dinner. To be sure, if there was a fire in the night, I must inevitably be burnt; for I am at the top of the house, and so removed from the front part of it, that I cannot hear the least sound of any thing from the street; but then, I have a great deal of fresh air; more light than most people in London, and the enchanting view of the Thames; the Surry Hills; and of three windmills, often throwing their giant arms about, secure from every attack of the Knight of the woful countenance.—*Memoirs of Mrs. Inchbald.*

BROOKS' PATENT SILK SPINNER.

THE public attention is invited to this machine. It is adapted to domestic use, is simple in its construction, occupies a small space, and may be used to advantage by women and children. This machine may be obtained by applying to T. R. NEWELL, at the Agricultural Warehouse, No. 52 North Market street, Boston; or to the Patentee, ADAM BROOKS. SITUATE, July 22, 1833.

BOOKS.

Books upon Agriculture, Horticulture, and Rural Economy, Published and for sale by Geo. C. Barrett, N. E. Farmer Office, 52 North Market st. Wholesale and Retail Booksellers supplied on very liberal terms, and their orders solicited. aug 14

NEW AMERICAN ORCHARDIST.

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J. 19.

NEW ENGLAND FARMER'S ALMANAC FOR 1834.

NOW in Press, and will soon be published the *New England Farmer's Almanac for 1834*, by THOS. G. FESSENDEN, Editor of the New England Farmer, and will be for sale Wholesale and Retail, by GEO. C. BARRETT, at the N. E. Farmer office. Dealers supplied on very low terms, and orders are solicited early.

The flattering reception and extensive circulation of the six first numbers have induced the publishers to render the 7th No. as useful and interesting as possible. if a 14

PEMBROKE BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butte. Salt. 6600 loaves Table Salt.

Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale. june 5 CHAS I. CAZENOVE & CO.

PETTICOAT ROBES, at 3s.

ELIAB STONE BREWER has just received 500 three breadth Petticoat Robes for 3s. For cash only at 414 Washington St. a 20

RUSSIA DIAPERS, at \$2 a Piece.

ELIAB STONE BREWER has just received 1000 pairs Russia Diaper 1-2 ell. Selected in Russia by Wm. Ropes, Esq. expressly for the retail trade of Boston, which are offered for sale for cash only, at 414 Washington Street. a 20

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[] No paper will be sent to a distance without payment being made in advance.

COMMUNICATIONS.

THE CULTURE OF WHEAT.....NO. III.

THE culture of wheat in New England is a subject of so much importance, that I shall be excused if I dwell longer upon it; certainly not with any view to instruct my brother farmers, most of whom are better acquainted with the subject than myself; but with a view to furnish some facts which have come under my own observation, and excite such inquiries with others as may in the end lead to valuable and practical results; results, which in agriculture must always be practical in order to be valuable.

We have no reason to despair of the successful cultivation of wheat in New England; and, if proper means are used, of obtaining an ample supply for our own consumption. Whether it would be advisable to attempt this as long as the fine rich soils of western New York, Pennsylvania, Ohio, the eastern shores of Maryland, and Virginia, so well adapted to this cultivation, at so cheap a rate, pour out their rich treasures directly at our doors, and in such abundance that even the poorest man among us, is not without his wheaten loaf, and Yankee industry and invention in its countless, Protean forms supplies to those, who will use them, the ample means of competence; yet it is certainly desirable to understand the capacity of our soil and climate, to know that we have such resources within our possession; and perhaps where our soils are capable of being cultivated, without too great an expense of labor and manure, wheat may be found to yield the best return of any arable crop to the labor of the industrious and enterprising farmer.

The crops of wheat, both summer and winter, have been in this vicinity good and abundant. The crops of wheat in England, where the cultivation is supposed to be as fine as the present improved state of agriculture can render it, the average produce of wheat is rated by Armstrong, at eighteen bushels per acre; by Sinclair at twenty two. In the interior of New York, from the best information which I can obtain, it does not average higher than from twenty to twenty-five, or say twenty-two; and in Virginia not higher than six or seven bushels. The average crops in this part of the country for the last two years, where it has been cultivated, have been full twenty; and while the labor of raising it, is greater than on the virgin lands of the west, yet the superior value of the crop is not far from an equivalent.

The crops of wheat in Springfield, Northampton, Hadley, and lower down on the river have been abundant and fine. In this and the neighboring towns, the crops, with some exceptions of blight, have been equally favorable; and in the single town of Northfield in this State, where three years since the article was scarcely cultivated, I have heard the crops of this year rated as high as seven thousand bushels. I think this must be an over estimate; but any thing like an approach to this, or even an adequate supply for the population of the town, which is believed to be fully secured, is certainly a considerable event in our agricultural history.

William Pomroy, Esq. of Northfield, whose

farm for its fine condition and admirable management is not surpassed by any one that has come under my observation, its extent, expenses, neatness and productiveness, all considered and compared, has this year harvested from twenty three acres of old meadow land on the banks of the Connecticut, more than five hundred bushels of winter and spring wheat, of as fine a sample as ever floated on the Erie Canal. A part of it was reckoned to yield fully thirty bushels to the acre. This crop was without blight excepting one small parcel, and the facts respecting this, confirm the suggestions made in a former communication, concerning the particular state of the weather at the time of forming the grain, being the cause of blight.

Most of this wheat was sowed very early. It had arrived at such a state of maturity before the sultry and foggy weather of July came on, to be perfectly secure from injury. The piece which was blighted, though of the same seed, the land at the side of the perfect crop, and with no difference of preparation, was sowed much later, the sowing having been necessarily delayed until after a crop of Indian Corn was removed from the ground. This derives farther confirmation from the fact, that two fields, in the immediate vicinity of his own, on the same flat, and one or both of them lying between his lots, being sown late, were both of them severely blighted. The condition of seven acres of this wheat land, and which bore as heavy a crop as any part, being well remembered, it may be desirable to state. In 1828 and 1829 it was in Indian Corn and manured at the rate of about eight four ox cart-loads of barn manure to the acre each year. In 1830 and 1831, it bore a crop of Broom Corn, and was manured with six loads of manure to the acre. In 1832 it was in oats, without manure, and bore a fine crop. The stubble was then ploughed in and wheat sowed at the rate of about one bushel of seed to the acre, without manure and no preparation of the seed, other than that of washing and sprinkling plaster upon it.

William Wells, Esq., in Shelburne, on a side hill on old land, from an early sowing obtained a fine crop. No manure was applied to this land the year of its being sowed; of the previous crop I am not informed. This gentleman's farm is an example of excellent husbandry, obvious at once to the passing observer. Mr. Charles Williams had a piece in my vicinity, on a hill on the meadow lands known by the name of Fort Hill, being a very considerable elevation and rising gradually from the meadow on all sides. This was badly blighted. It was sowed late in October. What is remarkable however, is that the blight principally attacked the lower sides of the field; and that on the top of the hill, where the dampness and fog were not likely to prevail and remain so long, there the wheat was of a fair quality. This corresponds with the observations of Sinclair's Gen. Report, vol. i, p. 476, where speaking of the wheat blight in 1808, the writer says, "No discrimination of soils could be pointed out as more or less affected by the disease. It attacked the crops of wheat on strong as well as on free soils; and the only observable difference was that high, open, free-aired situations were comparatively less diseased, while

low grounds, much sheltered by high hedges, hedge row trees, and plantations, and situations near rivers, were obviously and considerably more materially injured. The near neighborhood of the sea seemed to have a beneficial influence in preventing or lessening the disease." Then in a note he adds, "Hedges and trees by preventing a free circulation of air, would detain moisture longer in the grain, than in open situations. Near the sea there is generally a circulation of air, occasioned by the tides perhaps, even in the calmest weather."

Mr. Orrin Dole, of this town, cultivated a small piece of wheat in my immediate neighborhood, the growth of which was very luxuriant but the crop was very severely blighted. The sowing was very late, and the situation on the borders of Green River, low and very confined. The previous crop was potatoes.

Mr. Augustus Wells of this town raised a crop of fine wheat on the upper meadow land near the centre of Deerfield village. The extent of land was nine-tenths of an acre. It was last year in Indian corn; after this crop was gathered, the land was ploughed; eight loads of barn yard manure were spread on the surface, and one bushel and three perks of seed without any preparation were sowed on the piece on the 17th of October. The crop was very fair though slightly blighted; and the yield in this piece was twenty-one bushels.

The wheat crops of John Wilson, Esq. on the banks of the Connecticut, whose farming is distinguished by its intelligence, neatness and skill, were considerably blighted. They were sowed, I think, after Indian Corn and Ruta Baga, both of which crops were manured. The crop after Ruta Baga was much poorer than the other parts of the field, which is confirmatory of my own belief and experience that valuable as the Swedish Turnip is, it scourges the land severely. The seed was washed in brine and rolled in lime. The yield not ascertained. The sowing from accidental circumstances was quite late.

A respected correspondent writes me from Hatfield that "Dr. Hastings of that town, the last year, reaped from three acres ninety bushels. He measured one acre, and had 34 bushels and 2 qts. The other two acres were a little winter-killed, but there was no blight. The wheat was sowed the fore part of October, after Broom-Corn; the corn (that is the stalks) ploughed under; after ploughing, 2 loads of fine manure per acre spread over. The seed sowed without any preparation. The wheat is bearded, of a redish cast. Dr. Hastings says the flour is equal to any of the Western flour. This kind of wheat was brought from Springfield 14 years ago; and has been raised in town ever since, and I have heard of no blight until the present year. Capt. Hastings reaped this year from about one and a half acre, he judged, 21 bushels; Mr. Morton, from one acre, he judged, 30 bushels, had it not been a little blighted; Maj. Porter 18 bushels from three-fourths of an acre, a little blighted."

The red bearded wheat here mentioned, is the same kind as that sowed by Mr. Pomroy, who also procured his seed from Springfield; and is considered by the English farmers, from their own

experience as less liable to blight than the long and thick chaffed variety.

Mr. Ames, the respected Post Master of Greenfield, three years in succession preceding the two last years, raised good crops of wheat, some of which were estimated to be at the rate of thirty bushels to the acre on elevated land in the Deerfield meadows. His practice was at sowing, to manure the land pretty freely with well rotted barn yard manure spread on the surface and harrowed in.

The premium crop of Col. Wilson, 34 bushels to the acre, has been already mentioned. The crop of Hooker Leavitt, Esq. of Greenfield, for which he last year obtained the premium of the Mass. Society, amounted to 38 bushels 22 qts. on an acre of land, less three rods. The soil was rather sandy and light; and was ameliorated by the intermixture of considerable clay, which he laid upon it.

I am not able to obtain a satisfactory account of the giving up of the cultivation of wheat in this part of the country. The Hessian fly has sometimes prevailed; and a few unfortunate years, added to the superior success of the farmers in their rye crops, and the cheapness of western flour, probably discouraged them. I find however in the reports of the Mass. Society, many very successful experiments.

Mr. William Russell, of Middletown, Conn., in 1797, speaks of having raised on less than two acres of land 44 bushels weighing 68 lbs to the bushel of winter wheat, without a single blasted ear.

Mr. Jeremiah Wadsworth of Hartford, in 1798 obtained 30 bushels to the acre "a fine plump berry, very sound and good."

In 1807, Dr. Payne of Worcester reports to the Mass. Agr. Society, that the crops of wheat in that town average 24 bushels to the acre, which on account of the good quality of the wheat, sold at two dollars per bushel; and then adds that any man may raise wheat in that town, who is not disinclined to the labor.

Justin Ely, Esq. of West Springfield, in 1816, writes, that "the early Virginia seed wheat, (but not wholly white) has been more productive here than any other, yielding from twenty to forty bushels to the acre." The same gentleman in a communication dated in 1817, says that the largest crop of winter wheat was raised in Springfield the past summer, that was perhaps ever raised before in New England. Four acres of land, one of the house lots in Springfield Street, belonging to the Distillery Company produced two hundred bushels of good, clear, heavy wheat. The summer of 1816 it will be remembered was the extraordinarily cold summer.

I might produce other considerable examples of success; but I fear I have already extended my communication too far. These facts are certainly remarkable and encouraging. The wheat crop is indeed subject to many enemies, casualties, and dangers; but these far from leading us to despair should prompt to more careful and assiduous inquiries for a security or preventive. That no certain security against blight, as far as it depends on the weather can be found is obvious, for what is less a matter of calculation than the weather?—Yet something may be obtained, and some practical conclusions from what has been stated are obvious; these together with some considerations on the use of lime, and the choice of seed, if your

patience is not exhausted, will be the subject of a future communication.

H. C.

Meadowbanks, Deerfield, Aug. 21, 1833.

From the Fitchburg Gazette.

WHEAT.

THE interest indicated in the columns of your Gazette for the Agriculture of our country, emboldens me to send you a brief detail of my success in the cultivation of Wheat the present season.

By the kindness of a brother, I received about three years since, one bushel of wheat obtained by him from on board a ship, which with many others, were unloading in the port of Smyrna cargoes of that valuable grain, the product of the abundant shores of the Black Sea. The appearance of the wheat was much in its favor; its flour had been sufficiently tested at Smyrna, but feeling somewhat diffident of its succeeding in this country, I sowed but one peck in the spring of 1831—the product at harvest being far inferior to the seed sown. Believing the season to have been unfavorable for every kind of wheat, I was induced in the spring of 1832 to sow a part of the product of the previous year, rather than that imported, as it is generally conceded that vegetables as well as animals need acclimating before complete success will be the result.

The product at harvesting was excellent, both in yield and quantity—the straw being large and stiff, bore up against the peltings of the New England storms better than my other kind (Gilman). From this product four bushels were sown last April, two and a quarter bushels were sown on the same acre from which 613 bushels of potatoes were harvested last autumn—the other bushel and three pecks were sown on other fields, all with the most complete success.

The wheat grown on the above mentioned acre was cut on the 14th inst. when the berry or kernel was to the full, like India rubber—in this state of the berry should all English grain be cut (Barley perhaps excepted) as the flour will be whiter and sweeter, with a further advantage, that the grain will not waste so much in the field—the straw likewise more valuable for fodder. The product from this acre was 53 shock and 5 sheaves, or 800 sheaves of large size, as much of the straw (as you will see by the sample I send you) in the field was five feet in height. There appears to be four different kinds of wheat, viz. the white, the red, a very little of the bald, and the double-headed or pearl (as I shall call it); this last grows very luxuriantly, some stalks measuring but little short of six feet to the top of the beard. The reapers judged there would be over 40 bushels to the acre—of the accuracy of this judgment, the flail and half bushel will soon enable us to determine—I will add that many of the ears gave from 60 to 80 fold, and in some instances where the mother-kernel fell in a more propitious situation, branching out in several stalks, 300 fold were counted.

I need not add, perhaps, that the field was at sowing in a high state of cultivation, made perfectly clear from weeds the previous year.

Old Massachusetts cannot be considered a wheat-growing State, as a more clayey and limestone soil is more congenial; yet, sir, much more might be grown of that valuable grain, giving the farmer greater profit for his labor than many other products now cultivated; for as far as experience has tested the fact nine times in ten (the ground being properly prepared,) more bushels of wheat will be grown on the acre, than spring rye, side by side

—the former always bearing double price of the latter. Let it be understood that a wheat crop should not be attempted on our worn soils, with less than 16 cords of unfermented (or long) animal manure or 12 cords of fermented, (or short,) contributed to the previous crop, (it is believed that potatoes are the best for a preparatory crop,) let it be understood likewise that the tilth for wheat must be more fine and particular than for rye: sowing on 20 bushels of unleached wood ashes to the acre, soon after the wheat is up, will not only make it kernel better, but will check the ravages of the white maggot, which sometimes attacks its root. A further advantage of wheat may be found in its being the most proper for protecting the young and tender grass plants which are designed to give a crop the year following.

A few words in passing, on the grass called red-top. It is about seven years since I turned my attention to the cultivation, or I might more properly say to the sowing the seed of this valuable grass, in connection with herds-grass, for winter fodder. Having procured one bushel of red top seed, it was mixed with a like quantity of herds-grass or Timothy seed (I sow no clover seed on my mowing lands, as quite sufficient of that seed is carried on with the manure,) and sowed in company with wheat, on one acre. In order that it should be sowed evenly, the sower followed the harrow, which was covering the wheat—after which the grass seed was harrowed and rolled in. If parsimony says this is too great a quantity of seed, I answer that I not only get back my money in fall feed, but the following crops of hay are much finer, and of course better quality.

The first crop from this field was about 2-3 clover, 1-3 herds-grass—second year's crop 2-3 herds-grass, 1-3 red top—third crop, half of each—fourth crop, 2-3 red top, 1-3 herds-grass—fifth year about 5-6 red top, 1-6 herds-grass—sixth crop almost all the high grass red top, with a thick under crop of white clover, giving a surface for the scythe as even as that of salt marsh. The crop last harvest, notwithstanding the season has not been an abundant one, was judged to be 5000 lbs. of well cured hay—superior it is believed to any other kind, for the stage-horse, working ox, or any other herbivorous animal while performing hard labor. The six crops above mentioned would probably have given an average of 5500 each year, and will probably yet be mown with profit several years longer. I would mention in this place that this field when last planted with potatoes, (the year previous to stocking down with grass) received 20 cords of strong manure, since which time the result has given a further proof that the American Farmer, in too many instances, sprinkles his manure over too many acres. As far as I have had experience in growing red top, I have observed that it bears the drought remarkably well, will succeed on poor thin soils, with a further advantage that it waits for the scythe three weeks without materially deteriorating in value.

If you think the above hasty sketch will in any way subserve the interest of Agriculture by appearing in the Gazette, you have the permission of

Your obedient servant,

PATSON WILLIAMS.

Fitchburg, Aug. 21st, 1833.

Railroad Speed. The locomotive engine and cars lately ran the distance (22 miles) from Saratoga to Schenectady, on the Railway, in 54 minutes and 33 seconds.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

Saturday, August 31st, 1833.

Mr. David Haggerston, from the Society's Garden at Mt. Auburn Cemetery, Dahlias, Nuttallii, Scarlet turban, Washingtonian, Prince Leopold, Mill's dwarf crimson, Vulcan superb, Blazing comet, Helianthiflora, Eclipse, Well's victory, Hurd's favorite, Coccinea superb, Globe anemone flora, Rainbow, Schizanthus pinnata, Petunia nyctaginiflora, Coreopsis tinctoria, Silene maritima, Cnothera vimica, do. Lindleyana, Ammobium alatum, Vicia atropurpurea, Ageratum mexicanum, Zinnia multiflora, Calceola coccinea, Datura metel.

S. Walker, Roxbury. Fine specimens of Dahlias, &c. as per last report.

William Kenrick, Newton, Delphinium grandiflora, Aconitum napellus, Helianthus multiflorus, Symphora racemosa, Chocorus japonica, Altheas, Roses, Honeysuckles, Dahlias, &c.

Per order of the Committee,

JONA. WINSHIP, Chairman.

EXHIBITION OF FRUIT.

Horticultural Hall, Aug. 31, 1833.

The exhibition of fruits which took place this day, was the finest which has hitherto been seen during the season.

Apples. From Gorham Parsons, Esq. of Brighton, to whom our Horticulture is so much indebted, there were received 14 kinds of apples—the Gravenstein prematurely ripe, was very fine; Early apples, Nos. 1 & 2, were fine looking red apples, one of them of good flavor, the other excellent—Early Bellflower, now ripe and good, it much resembles the Porter. Also, unripened specimens of Orange Sweeting or Apostle Elliot apple, Fameuse or De Nieve (Canada) Borosseau, Nonpariel, Paradise apple for stocks, Siberian Crab, and the following celebrated cider apples; Hagloe Crab, Hewes' Virginia Crab, North's Crab, Siberian Bittersweet. **(See the letter of Mr. Parsons below.)* By Mr. E. M. Richards, Benoni, productive, very early, handsome and fine; American Summer Pearmain, another noted fine early fruit. Also, Pumpkin Sweetings, fine for eating as well as baking; these last were obtained from the garden of the Hon. James Richardson. By ———, High Top Sweeting, a small fruit. By Mr. R. Ward, of Roxbury, a variety of the Pumpkin Sweeting. By Gen. Josiah Newhall, of Lynnfield, Seedling apples, striped red, and of pleasant flavor. By Gen. Sumner, Early Bough. By Mr. Geo. W. Pratt, of Bridgewater, small seedling apples in a decayed condition.

Pears. By Messrs. Winship, Bleeckers Meadow, yet unripe. By Mr. Jewett, of Salem, Gracioli or Summer Bon Chretien. By S. G. Perkins, Esq. Caillot Rosat, a middle sized fruit of a rich and very superior flavor. By Mr. John C. Lee, of Salem, a fine pear from France, bearing resemblance to the Francreal D'Ete. By Mr. Manning, Juliette of Coxe, always fine, and very productive; Vallee from France, as figured in Brookshaw, medium sized, juicy and of good flavor. By Mr. R. F. Phipps, of Charlestown, fine specimens of Bartlett, not yet at maturity; also, a small branch, a noble specimen of this same superior variety, containing 21 large pears, received by Mr. Phipps and erroneously for *Heathcot*.

Peaches. By Mr. Hall of Medford, specimens

of fine quality. By Mr. Thomas Mason, of the Charlestown Vineyard; fine specimens of the following kinds, Early Royal George, Alberge Royal, Bellegarde, Royal Kensington, Royale, Grosse Mignonne.

Nectarines. By Mr. Thomas Mason, Elruge Nectarine, and another variety, both fine.

Plums. By Gorham Parsons, Esq. fine specimens of a very large oblong blue plum of superior flavor, received by him for Blue Gage. By Mr. Samuel Pond, of Cambridge, specimens of the following, all fine, Pond's Purple, Green Gage, White Gage, Smith's Orleans, and Bolmar's Washington. By Edward Cruft, Esq. of Boston, specimens of a fine blue plum, name unknown. Also, the true Bolmer's Washington which always separates freely from the stone. This fine and noble variety which was first (as we believe) introduced to this vicinity by Mr. Cruft, has been by him freely disseminated with his wonted liberality. By Dr. Williams, of Cambridge, Orleans Plums. By Mr. Vose, True Bolmer's Washington. By Mr. A. D. Williams of Roxbury, specimens of a large oval, pale red Plum, name unknown. By E. Bartlett, Esq. Bolmer's Washington and Orleans, both fine. By B. V. French, Esq. Semiana, a fine kind. By Mr. Samuel Hastings, of Boston, Seedling plums. By Mr. R. Ward, of Roxbury, Prince's White Gage, fine. By Mr. Mason, of the Charlestown Vineyard, White Plums, name unknown. By Ebenezer Putnam, Esq. of Salem, Prince's Imperial Gage, and a branch loaded with the fruit of this very superior variety. By Mr. Manning, a fine blue plum, name unknown, and another large blue plum of excellent quality, name unknown, other varieties names unknown,—also, specimens of Bingham Plum, fine; Bolmer's Washington, do. do.; German Prune so called by some, a long blue plum of delicious quality, it hangs on the tree till winter, it shrivels becoming quite dry.

Grapes. By John Prince, Esq. several fine clusters of Black Hamburg. By Jacob Tidd, Esq. Tidd's Early oval, a seedling from the Malaga, raised by Mr. Tidd, very sweet and pleasant. By Mr. Mason, of the Charlestown Vineyard, 8 Bunches of ripe Black Hamburg, the largest of which weighed 2½ lbs. and three bunches on one stalk weighed 5½ lbs.

Per order of the Committee,

WILLIAM KENRICK.

* Brighton, Aug. 31, 1833.

DEAR SIR:—I have sent a few apples for your examination, and shall not feel hurt if you do not report them, if on examination you think the good cause will not be benefitted by it. I send three, and three only of my Blue Gages, scions from Mr. Mumford, New York. I am rather loth to send but three, but they are all that remain sound. Mr. Mumford sent me scions of various kinds, they came in fine order, and all that have shown fruit are fully equal to his representation.

Yours, &c. GORHAM PARSONS.

MR. JONATHAN WINSHIP.

Hagloe Crab; Siberian Crab; Hewe's Crab; North's Crab, the very best of the crabs, No. 1; Siberian Bitter Sweet, Mr. Knight, London; Paradise Apple, make good stocks for Dwarfs; Two Gravenstein Apples, windfalls; (Orange Sweeting, or the Apostle Elliot Apple; Autumn Bell Flower; Famous Snow Apple, Canada, not ripe; Borosseau, a Winter Apple; Nonpariel,

larger, and more abundant this season than usual.

Three Blue Gage plums, scions Mr. Mumford sent me, with the best description of the fruit I have ever met with; all that have shown fruit, prove all and more than he said of them. Two Apples sent me to know their names.

No. 1. } Both early Apples.
No. 2. }

The Orange Sweeting, scions from a Tree carried by the Natick or Nonantum Tribe of Indians, and set out in front of Apostle Elliot's House, as a mark of their regard (natural fruit of course): for my authority I refer to Hon. John Welles, Boston; it is an early and excellent Baking Apple. G. P.

EXHIBITION OF VEGETABLES.

By Mr. R. Ward, of Roxbury, Lima beans; also, beans called *Fat Horses*, seed from Dr. Ward, of Georgia.

The following note accompanied some large Lima Beans, presented for premium.

Roxbury, Aug. 31, 1833.

GENTLEMEN,—The Lima Beans, here presented for Premium, were planted on the 15th day of May, on the same ground as those presented in 1831, and '32, in hills 4 feet, distant 8 beans to a pole. The soil is rich, manure spread in the spring, and dug in.

The Seed from which the string beans exhibited were raised, I received from Dr. Ward, of Georgia, where they were called "*Fat Horses*."

R. WARD.

A. D. WILLIAMS, for the Com. on Vegetables.

Beech Trees proof against Electrical Fluid. A correspondent of the American Farmer states, that it is a very common opinion among surveyors and woodsmen of the western states, that the beech trees possess the non-conducting power ascribed to the cedar; "I presume," says he, "I have passed a hundred oaks which have been stricken, and although beech is more common than any other timber, have not discovered one of that kind."

IMITATION OF NATURE.

WHEN Smeaton rebuilt the Eddystone light-house, he spent much time in considering the best methods of grafting his work securely on the solid rock, and giving it the form best suited to secure stability; and one of the most interesting parts of his interesting account, is that in which he narrates how he was led to choose the shape which he adopted, by considering the means employed by nature to produce stability in her works. The building is modelled on the trunk of an oak, which spreads out in a sweeping curve near the roots, so as to give breadth and strength to its base, and again swells out at the bushy head, to give room for the strong insertion of the principal boughs.—The latter is represented by a curved cornice, the effect of which is to throw off the heavy seas, which being suddenly checked, fly up, it is said from 50 to 100 feet above the very top of the building, and thus to prevent their striking the lantern, even when they seem entirely to enclose it. The efficacy of this construction is such, that after a storm and spring-tide, of unequalled violence, in 1762, in which the greatest fears were entertained at Plymouth, for the safety of the light-house, the only article requisite to repair it was a pot of putty, to replace some that had been washed from the lantern.—*Gallery of Portraits, with Memoirs.*

From the *Buck's County Intelligencer* of 1831.

THE PRACTICAL FARMER—No. 2.

THE most eligible time for sowing the seed of Orchard Grass, I am induced to believe, is as early in the spring as the state of the ground will admit; and as clover is the best adapted to the growth of this grass of any with which I am acquainted, they may be advantageously sown together. I have usually sown clover seed at the rate of about four quarts per acre, and afterwards followed with orchard grass with one bushel on the same quantity of ground. This plan has been preferred from a knowledge of the fact, that the latter grass does not generally advance as rapidly as clover, (it not seeding the next season after sowing,) but there is always sufficient of the blades, if the seed takes well, to improve very much the quality of the clover hay. The succeeding season the orchard grass occupies much more space, gradually increasing as the clover declines. The experience of the growers of this grass has shown that the crop improves for at least seven years. Unlike Timothy and Herd, the bulk of this grass consists in the blades; and of course, when the top is cut for seed, the value of the crop for hay is not much lessened, the part usually cradled being of comparatively small value; but after the seed is gathered, it does not, like the grasses just mentioned, become dead and dry, but continues green and in a suitable state for cutting during several weeks. I have this season mown the stubble which had been standing more than four weeks, and the larger part of it furnished hay of a very good quality; on the other hand I have observed several patches of Timothy and Herd that have been cut for seed, the stubble of which would not be worth gathering for any thing but manure.

In sowing the seed of this grass, especial care should be taken to distribute it evenly over the ground, it being light, (weighing but about 15 lbs. per bushel,) and easily acted upon by the winds. On an eight pace land four casts should be sown, the sower scattering seed with every step. But it should not be mixed with clover or any other heavy seed, as the difference in weight will vary the extent to which a cast will reach. With respect to the quantity of seed per acre, those who sow with a view of making it the sole object, would probably consult their interest in sowing one and a half or two bushels per acre; but one bushel sown in the manner above mentioned, has been productive of a profitable result, both as respects the improved quality it has imparted to the hay, as well as the seed it has afforded. The appellation of *Orchard* has been given to this grass, from its known congeniality with shade. I have known very luxuriant crops to grow in an orchard, producing three cuttings in a season, although the trees were large, and almost entirely shading the ground; but in such situations it will not produce seed.

The *fertilizing quality* of this grass was formerly mentioned, and it may probably be attributed to the circumstance of its shading the soil more effectually than most other grasses, excepting clover. If a field of it should be kept for mowing, there will be very little time during the warm weather in which the grounds will not be protected from the heat of the sun; and if for pasture, unless it be too heavily stocked, the soil will be shaded by a sufficient covering of this luxuriant grass.

It may be mown for hay at any time best suited for cutting the clover with which it grows; but if

it is designed to save the seed, the mowing must be deferred till towards the last of June, at which time the seed will be ripe. This should be cradled before it is ripe enough to waste, bound in small sheaves, and shocked in rows. The stubble may then be mown immediately, or to suit the convenience of the farmer, the seed requiring some exposure to the weather to render it in a suitable state for thrashing.

I subjoin the following analysis, contained in Sir Humphry Davy's *Agricultural Chemistry*. The quantity of grass from which the estimate is made, grew on a spot of earth contained in four square feet, in a garden attached to Woburn Abbey. The soil was selected, as best adapted to the culture of said grass—a circumstance which may account for the great burden obtained for the estimate per acre.

Dactylis glomerata—Round-headed cocks-foot grass, (or Orchard Grass.)

| | lbs. per acre. |
|--------------------------------------|----------------|
| Grass in flower—rich sandy loam, | 27,905 |
| When dry, - - - - | 11,859 |
| Nutritive matter, - - - - | 1,089 |
| At the time the seed is ripe, grass, | 26,544 |
| When dry, - - - - | 13,272 |
| Nutritive matter, - - - - | 1,451 |
| Rowen grass, (or 2d crop,) - - | 11,910 |
| Nutritive matter, - - - - | 281 |

This analysis is given as a mere matter of curiosity, as the climate of England, differing so much from this, must make a great difference in the result. The time of the first crop's growing in that climate continues to a period of one month beyond the same growth in this section of the United States; and hence the Rowen or second crop might be expected, (as the result shows,) both inferior in bulk and quality to what it is in this country.

From the *Vermont Chronicle*.

THE WHEAT INSECT.

THE wheat crop in this vicinity, and if report speaks truly, generally through the whole country, never gave greater promise of abundance, than it has done this season, up to the time this insect commenced its ravages. So far as examination and inquiry have extended, (and we have taken considerable pains to learn the extent of the injury done by them to the crop,) very few fields have entirely escaped the attacks of these insects.—Some fields are supposed to be nearly destroyed; while others are affected in a much slighter degree. So far as we can ascertain, the latest sowed wheat is much less infested by them, than that which was earlier sowed.

In some fields these insects are numerous almost beyond the reach of the imagination.—From five to seven are found in the husk of a single grain and in almost every husk in the ear. This insect is not, as has been described by some, a maggot in the kernel of the grain, and confined to it; but, moves about at pleasure, within the husk of the kernel; and after a shower of rain, they have been seen in such countless numbers on the beards of the wheat, as to give the whole field the color of the insect.

The insect is of a sulphur color, and one tenth of an inch in length; and through a magnifying glass its skin appears hard and polished, like that of the wire worm. It is beyond a doubt, a very different insect from the one denominated the weevil.

It is *probably* the same species of insect, which is described by Mr. Gorrie in the *Quarterly Journal of Agriculture*. He says "in May or June, as soon as the temperature rises to 57 or 58 deg., for a week or ten days, the flies begin to appear. If this happens in May, the flies deposit their eggs before the ears of the wheat appear, and are then comparatively harmless; but if the ear which they make their nidus, has burst the sheath before this period, they fix themselves on the glume, and deposit clusters of eggs on the stigma. In nine days after the eggs are deposited, the caterpillars appear fully formed, of a sulphur color, and devour the embryo grain. After the ear is fully developed, and about an inch above the sheath, the fly never attempts to deposit its eggs upon it. In three weeks, from the time the eggs are deposited, the maggots disappear from the grain, and burrow in the ground. The damage done by these insects in three years, in the Braes and Carse of Gawrie, was estimated at 400,000 dollars. No remedy has been found for the evil." If the fly, which Gorrie describes, be the same species of insect with those which are now ravaging our fields of wheat, as it certainly appears to be, from its similarity of habits, there is great reason to hope, that late sowing will prove a remedy.

One important fact which goes to sustain this belief is, that several fields of late sowed wheat on examination, appeared to be very little damaged. Another, equally important, is, that the latest sowed field of wheat which we examined, and which appeared almost, if not altogether untouched, by this insect, had a sprinkling of rye among it; and this rye though not the natural, or chosen nidus of the insect, was swarming with them. This is to be accounted for from the fact that when wheat and rye are sown together, at the same time, the ears of the rye burst the sheath, from ten days, to a fortnight sooner, than the wheat. There were probably none of the maggots on the wheat of this field, except what were produced from the eggs originally deposited on the ears of rye, and which might have escaped thence to the ears of wheat on their appearing above the sheath. The most minute observation, however, of the habits of these insects, can alone settle these questions. There can be little doubt, but that a proper knowledge of their habits, instincts, and time of depositing their eggs, might enable the farmer greatly to lessen, if not entirely to prevent their ravages.

At our suggestion, a number of farmers in Orange County saved their *Spring* wheat from the worms last year, by late sowing. *Winter* wheat cannot escape, except by being too early for the worm, and therefore all possible pains should be used to bring it forward.

Who is Gorrie, and where are the "Braes of Gawrie?" Are they in Scotland? Does Gorrie give any farther information concerning the insect? If so, let us have it, every word of it, in his own language,—even those parts which seem wholly unimportant.

From the *Virginia Farmer*.

PLANTING IRISH POTATOES.

Buckingham, May, 1833.

I PLANTED a piece of ground in Irish potatoes, some of which I cut in pieces, leaving an eye to each; the others I planted whole. Those planted whole produced more than those cut, though the same quantity in weight was put into each hill.

D. G.

IMPORTANT DISCOVERY IN MAGNETISM.

PROFESSOR KIEL, of Jena, has made some important discoveries and improvements in the quality and use of the magnet. At a late meeting of the Royal Society, the professor was introduced for the purpose of presenting to the notice of the fellows some of his improved magnets, of a very superior power, as well as explaining their efficacy in the cure of nervous diseases, and to which they have been very extensively and successfully applied by Dr. K. on the continent. It is evident, from the very far superior degree of power possessed by Dr. Kiel's magnet, that he adopts some mode of accumulating an intensity of magnetic force, superior to any method known or adopted by English philosophers. A small lyre-shaped magnet, of which he is possessed, weighing but 5 lbs. is capable of sustaining a weight varying from 100 to 130 lbs., according to the state of the atmosphere; magnetism as well as electricity being greatly modified by atmospherical influence. This magnet is also possessed of the very singular properties of inducing chemical action, in reddening vegetable blues, accelerating crystallization, &c. But the most surprising point connected with these magnets is their singular efficacy discovered by the professor in the cure of diseases connected with the nervous system, as in neuralgia, cephalgia, &c., and in alleviating the worst symptoms of tic douloureux, epilepsy, paralysis, rheumatism, gout, spasm, &c. In these complaints the most immediate relief is obtained; and (says Mr. Booth the lecturer on chemistry) "from various instances of its efficacy in trials which I saw made at a public infirmary, I feel convinced that this discovery of a new branch of the healing art must shortly rank as a new era in the history of medicine."

FIRE PROOF CEMENT.

THE French cement for the roofs of houses, to preserve the wood and protect it from fire, is made in the following manner:

Take as much lime as is usual in making a pot full of whitewash, and let it be mixed in a pail of water. In this put two and a half pounds of brown sugar; and three pounds of fine salt; mix them well together, and the cement is completed. A little lampblack, yellow ochre, coloring commodity, may be introduced in changing the color of the cement, to please the fancy of those who use it. It has been used with success, and been recommended particularly as a protection against fire. Small sparks of fire that frequently lodge on the roofs of houses, are prevented by this cement from burning the shingles.—So cheap and valuable a precaution against the destructive element ought not to pass untried. Those who wish to be better satisfied of its utility can easily make the experiment, by using on a small temporary building—or it may be tried by shingles put together for the purpose, and then exposed to the fire.—*Railroad Journal.*

HINTS TO HOUSEWIVES.

As far as it is possible, have bits of bread eaten up before they become hard. Spread those that are not eaten, and let them dry, to be pounded for puddings, or soaked for brewis. Brewis is made of crusts and dry pieces of bread, soaked a good while in hot milk, mashed up, and salted, and buttered like toast. Above all, do not let crusts accumulate in such quantities that they cannot be used. With proper care there is no need of losing a particle of bread, even in the hottest weather.

When ivory handled knives turn yellow, rub them with nice sand paper, or emery; it will take off the spots, and restore their whiteness.

When a carpet is faded, I have been told that it may be restored, in a great measure, (provided there be no grease in it,) by being dipped into strong salt and water. I never tried this; but I know that silk pocket handkerchiefs, and deep blue factory cotton will not fade, if dipped into salt and water while new.

Tortoise shell and horn combs last much longer for having oil rubbed into them once in a while.

Spots in furniture may usually be cleansed by rubbing them quick and hard, with a flannel wet with the same thing which took out the color; if rum, wet the cloth with rum, &c. The very best restorative for defaced varnished furniture, is rotten stone pulverized, and rubbed on with linseed oil.

Sal volatile, or hartshorn, will restore colors taken out by acid. It may be dropped upon any garment without doing harm.

Spirits of turpentine, is good to take grease spots out of woollen cloth; to take spots of paint, &c. from mahogany furniture; and to cleanse white kid gloves. Cockroaches, and all vermin, have an aversion to spirits of turpentine.

Lamps will have a less disagreeable smell if you dip your wick yarn in strong hot vinegar and dry it.

Clean a brass kettle, before using it for cooking, with salt and vinegar.—*Mrs. Child's Frugal Housewife.*

From the Old Colony Press.

A FARMER'S LIFE

—We should think, must be one of happiness. Could our friends amongst that class look in upon us, and witness the "doings" of a printing-office, they would thank their stars that they pursued a different calling. If there is any time when we are inclined to indulge feelings of envy, it is when we get loose from our confined and sedentary labors, after twelve or fourteen hours digging among the type, and sally forth to observe what is passing around us. It is then as we compare the healthy looks of the Farmer with the ghostlike appearance of our brethren of the ink and types;—see the fruits of his industry ripening before us and observe the looks of good nature and happiness shining through every feature, as he gazes upon the growth of that which his hands planted; and hears the voice of health and joy, and plenty, from his farm house; we are almost led to believe that the good things of this life are not equally distributed.

It is the truth that mankind are not half sensible enough of the farmer's situation, in regard to happiness, over every other class in the community. While the merchant, mechanic, and the professional men, are harrassed with care and anxiety, the farmer's mind is as free and clear as the air that meets him when he goes to his field. After the labors of the day are over, the husbandman can retire to his home and enjoy the "luxury of rest." Not so with the man of business: he only exchanges perplexing toil for anxious reflection; and while the 'lord of the soil,' is dreaming of fat oxen and agricultural prizes, his eyes are unclosed and his mind is upon the stretch in an endeavor to invent means of taking up notes at the bank, or some such equally unpleasant cogitation.

Wheat Harvest. Our farmers have begun to harvest their wheat; and they have seldom had so bountiful a crop as at present. Oats are also excellent, but Indian corn is very backward and unpromising. A large amount of hay has been cut among us this year, and cured in most excellent order.—*Maine Farmer.*

Great Yield. Mr. John Beaver of New Paltz, Ulster county, while harvesting his crop of wheat recently, had the curiosity to count the number of stalks produced by a single grain.—The result was twenty-six stalks from one grain, the shortest of which were 3 feet 9 inches, and the remainder averaged 5 feet 9 inches in length. The head of each stalk yielded on an average 60 grains, and the product of a single kernel was fifteen hundred and sixty! The variety was what is called the "crate wheat." The whole field yielded in a like proportion.—*Pough. Int. and Rep.*

The Crops. One of the Editors of this paper recently passed through the principal Cotton growing counties of the State, and the Crops were of the most promising description. The Corn crop is already made, and is a bountiful one. The late heavy rains have no doubt proved rather injurious to the fodder. The Cotton looks remarkably well, and should the remainder of the season prove any ways favorable, will yield a handsome remuneration to the labors of the Agriculturist.

We understand that the crops in the Lower Counties and the vicinity of the city are also in a promising condition.—*Savannah Georgian.*

The crop of rye the present season, in this vicinity, is uncommonly full of the ergot or spur. This is an active poison, of which fact every one ought to be aware. The rye of this year's growth may, perhaps, be as good, or even better for distilling than usual, as it will yield more deleterious matter than if it were pure. But those who consult the health of their families will do well to cleanse the rye which they grind for family use from the ergot—and such as neglect to do so, ought not to be surprised if severe sickness and death should enter their dwellings, in consequence of this neglect.—*Keene Sentinel.*

Knapp's Cork Mattresses. We have seen a certificate of three gentlemen, who witnessed the experiment made with Knapp's Cork Mattress on Saturday last. The certificate states that the experiment was entirely satisfactory. The mattress weighed twenty-six pounds, and sustained a man from Fort Independence to Long wharf. Though the sea was considerably agitated, the person on the Mattress sailed faster than the boat that accompanied him, and without wetting his head.

An experiment was made with the same mattress at the swimming-school on Charles river, a day or two since, and was equally satisfactory. Our informant states that three persons lay upon it, and as many others as could conveniently surround it endeavored to press it into the water without succeeding.

If these things are so (and we have no reason to doubt the accuracy of our information) the value of the grated cork mattress will be inestimable.—*Bost. Courier.*

The charter of Saco Bank expired in Oct. 1831, and all bills not presented for payment, by the 1st of Oct. next, will be excluded, as the property will be divided among the stockholders. Remember this who have bills on this Bank.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 4, 1833.

MILDEW IN WHEAT.

NEW BERLIN, Union County, Penn. Aug. 16, 1833.

To the Editor of the New England Farmer.

SIR, I find there is a difference between your correspondents B. and H. C. as to the cause of mildew, rust, or blast in wheat. Does it arise from any particular state of the air, or of the ground? The question is important, for a mistake in our theory may lead to very injurious practical results. This part of Pennsylvania affords almost every variety of soil which can exist in any country which is not of primary formation. We have fine alluvion along the rivers and larger streams, and as rich valleys between the ridges of our mountains, as are any where to be found; and all sorts of gravel and slate, red and black, from the sides and tops of high mountains, which yield nothing. We have some districts of country, (not large,) where thirty-five bushels of wheat to the acre is not an uncommon crop; and a good many farms and fields in our limestone valleys, which yield forty bushels, and perhaps a little over, to the acre. Within a few miles there is land, that would require a special effort to get ten. Our farmers are not all equally good, perhaps as various as the soil.

In the summer of 1829, the mildew did immense injury in this country. The wheat in a district of country from the Blue Mountain to the Alleghany, near a hundred miles long, and thirty or forty, perhaps fifty miles wide, was affected, and in some districts entirely ruined. A large portion of the farmers of Centre County, and many here, used old wheat for seed. It seemed impossible for us, seeing its effects on every kind of soil, to suppose that the mildew was occasioned by anything in the ground. There has been nothing like it since, nor previous, within my recollection.

We had about the time the straw began to turn its color, after the grain was formed, while in its soft, milky state, sultry weather, with occasional showers and sunshine, in quick succession. I recollect being at a field of mine, just after a very slight shower, hardly enough to lay the dust. The sun shone out with great heat. It seemed to me there was a slight vapor, not a fog, but I supposed the stuff which fogs are made of. A man who works for me, and has had long experience as a farmer, observed at the time that he was afraid our wheat would be mildewed. I did not then pay much attention to it. Though in two or three days afterwards, I was satisfied he was right. In a few days more the country rang with talk of it. Many men in whose observation and judgment I have great confidence thought the mischief in our neighborhood was principally done that afternoon.

Experience here, I think, does not teach that there is any danger of having too much straw, provided it will stand up till the grain is nearly or quite hardened. If it falls, of course we expect light heads. Nor can the kind of manure be supposed to have occasioned mildew; for there are in the district before mentioned, thousands of acres of wheat every year, on which no manure of any kind has ever been put since it was first cleared, except gypsum and green crops, ploughed under. Yet the wheat in this land did not escape more than others. I recollect hearing of but a single exception that season, and that was a piece of land newly cleared, with its first crop. It had adjoined

an old field, and that year was enclosed with the field, and was all, old and new, in wheat. That on the old land was blasted, and that on the new escaped. I know of no reason but this—new ground is not sown so early in the fall as old by some time, two or three, and sometimes four weeks. It is not in general so soon ripe the next season, though the difference is not so great: I have known the difference to be a week or ten days.

My belief is, that the cause of mildew is atmospheric; and that there is not more than five or six days in the life of wheat, in which the state of the atmosphere can produce this effect. And in the case of the old and new land farmed together, if that particular state of the air had happened a week later, the new land wheat would have been blasted, and the other would have been too hard to be injured. I believe further that grain which is late in ripening is most likely to be affected. I infer this from observing that green stalks, growing by stumps, or partially shaded, will be quite light headed, while the rest of the field will be sound and good. I infer it also from the fact that the straw is often quite rusty, and the wheat not at all or very slightly affected. I do not see any reason to doubt that the same state of the atmosphere that produced the rust would have blasted the wheat if the grain had not become too hard. I think this position is fortified by the consideration that the grains are not all equally shrunk. I do not know of any difference of soils as respects mildew except this. Wheat on a light sandy or gravelly soil, with a southern exposure, has shorter straw, and goes through the process of forming and perfecting the grains in a shorter time than it does on the same land exposed to the north; and much shorter than on heavy limestone lands. A mile distance with the different exposure, will make sometimes a week of difference in the time of cutting the grain. There is less time for the mildew to operate on the former than the latter, and of course the chance of escape is greater.

I make no apology for the length of what I have written, nor for coming between B. and H. C. *arcades ambo* undoubtedly, because you can do as you please with it. You will not publish it, unless you should think it may, in some degree, aid you and my brother New Englandmen, to find out where their enemy is, whether above or below the ground. If not published it will be but an hour spent in reminiscences, which I might have employed less profitably to myself.

Yours, JAMES MERRILL.

CARE OF HORSES.

AN old English writer says that the groom, or man who has care of horses, should demean himself in so kind and gentle a manner towards horses as to engage them to love him; for a horse is reckoned one of the most loving creatures to man of all other brutes, and in every respect the most obedient.

Therefore if he be dealt with mildly and gently his kindness will be reciprocal; but if the groom or keeper be harsh and choleric, he will put the horse out of patience, and make him become rebellious, and occasion his biting and striking.

Therefore the groom should frequently daily, toy, and play with the horses under his care, talking to them, and giving them good words, leading them out into the sunshine, there run and show them all the diversions he can.

He *must* also duly currycomb and dress him wipe away the dust, pick and clean him, feed and cherish him, and constantly employ himself in doing something about him, as looking to his heels, taking up his feet, rubbing upon the soles.

Nay, he ought to keep him so well dressed that he can almost see his own face upon his coat; he must likewise keep his feet stopped and anointed daily, his heels free from scratches, and other defects, ever having a watchful eye over him; and overlooking all his actions, as well feeding as drinking; that so no inward infirmity may seize upon him, without his being able to discover and endeavoring to cure the complaint.

The next thing requisite to a groom is neatness, as to keeping the stable clean swept and in order; saddles, housing-cloths, stirrups, leathers and girths clean, and above all his horse clean dressed and well rubbed.

Lastly, diligence is requisite in a daily discharge of his duty, and observing any the smallest operation, whether casual or accidental, either in his countenance, as symptoms of sickness; or in his limbs and gait, as lameness: or in his appetite, as forsaking his meat; and immediately on any such discovery to seek out a remedy.

To Correspondents. We have two poetical effusions on hand; one from a lady, and the other from a gentleman, which were received too late for this week's paper, but shall appear in our next.

Gama Grass. Those gentlemen, who, by letter or otherwise, have requested us to furnish them with seeds of Gama Grass, are respectfully informed that we have none; but should we be able to procure it, we will send them small parcels for experiment. We doubt, however, whether that plant will succeed so far north as New England, though perhaps it may be acclimated, and certainly deserves the trial.

ITEMS OF INTELLIGENCE.

The Drought. Farmers in the neighborhood of Boston, especially in the vicinity of the sea, are suffering severely by dry weather. The Hingham Gazette states that the drought has already been so severe that many fine fields have been almost entirely ruined, and grazing lands, upon high grounds wear an appearance of desolation. The air is cool and dry, and there is no appearance of refreshing rains. We learn that on the south shore generally the drought is equally severe, but as we have not noticed any complaints from the interior, it is probable that the extent of the dry weather has been circumscribed to narrow limits. Should the weather continue as unpromising for a week or two to come, as it has been for several weeks past, the result will be almost ruinous to our agricultural interests dependent on the products of autumn.

The Nasturtium. Our Horticulturists and floral amateurs will be pleased with the information in the following paragraph from the London Literary Gazette.

There is this season a rich and beautiful variety of the nasturtium, which has sported several colors both more deep and brilliant than that to which we have been accustomed in the plant. We have seen one almost blood-color, and several of fine browns and dark reds. The gardens are also this year improved by some pretty annuals from Mexico. A florist tells us that the nasturtium has not sported (as the term is) before for two hundred years.—*Boston Courier*.

In fifty-one towns in Maine, containing a population of 45,960 souls, there is no retailer of ardent spirits.

The Cholera has entirely disappeared from Cincinnati.

Dr. Kearney, fleet surgeon of the United States naval force in the West Indies, in a letter to the department, attributes the unusual exemption of the ship *Vandalia* from sickness, mainly to cleanliness, ventilation, and the general use of chlorides of soda and lime as disinfected agents; to which may be added, as auxiliaries, the use, with other precautions, of the subacid fruits of intertropical climates, and an abstinence, as far as practicable, from the use of "grog."

He says that a large number of the crew have commuted their rations of whiskey for pay.

An Earthquake was felt at Virginia on the morning of the 27th ult. at about half past 6. Vibrations were also perceived in several parts of the State.

Christ Healing the Sick, a copy of West's celebrated painting by Chapin, was sold at auction at Boston, on Friday last, for \$175, to Capt. Singleton.

The heirs of the Houses of England, Spain and Portugal, are little girls. This is an admirable commentary on the absurdities of hereditary monarchy.

Mount Vesuvius has been in a state of eruption since the 28th of May, and is daily thronged with thousands, many of whom pass the night at the brink of the crater. At about fifty paces from the burning bed of lava, booths are erected for supplying refreshments.

An Ice House, surrounded on every side with charcoal, lined with lead, and capable of preserving ice from shore to shore without the least difficulty, has been placed on the deck of the new ship *Utica*, of the New-York line of Havre Packets.

It appears from the society of Friends, that in consequence of their habitual temperance, one half of the society live to the age of 47; and that 1 in 10 lives to be 80; whereas the average of human life is 33 years, and not more than 1 in 40 of the general population, lives to be 80 years of age. The amount of human life thus gained in temperance, is more than the difference between 33 and 47—or an average of 14 years gained on every life—which is equal to 42 per cent.—*Judge Cranch's Address.*

Mr. Burges is re-elected Representative in Congress from Rhode Island.

BOSTON FANEUIL MARKET, Sept. 4, 1833.

Vegetables. Potatoes, 50 cts per bushel; Squashes, 2 cts. per lb.; White Portugal Onions, \$1 per bushel; Carrots, 75 cts pr bus.; Beets, 75 cts pr bus.; Cucumbers, 6 to 8 cts pr doz; Turnips, 6 cts pr bunch; large Lima Beans, 25 cts pr qt; Saba, or small Lima Beans, 20 cts. per qt.; Green Corn, 12½ cts pr doz; Tomatoes, \$1 per bus.; Pickles, 25 cts. per hundred.

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug 28

PENROCK BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butter Salt. 6600 loaves Table Salt. Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale. june 5 CHAS. I. CAZENOVE & CO.

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

GRASS SEEDS,

(for fall sowing.)

FOR sale at the New England Seed Store, 51 and 52 North Market Street.

Clover, (Northern)—Herds Grass—Red Top—White Clover (fine imported)—Lucerne, &c. &c.—Wholesale and Retail.

SEEDS,

for West Indies, &c.

Merchants, and masters of vessels and others trading to the West Indies, South America, &c. can be furnished with Boxes of seeds assorted and suitable for those markets at \$3 and \$5 per box.

Also, Smaller assortments at \$1 per box.

SEEDS.

(for fall sowing.)

FOR sale at the New England Seed store, connected with N. E. Farmer office 51 & 52 North Market Street.

White Portugal Onion seed—Silver Skin do.—Fall or Prickly Spinach—Black Spanish or Winter Radish—Celery, &c. &c.

HEARTH RUGS.

THE Subscriber has received 12 bales splendid American Hearth Rugs, Manufactured at the Tarriffville Factory, expressly for the subscriber, who offers them at a rate as much below the English prices, as they are superior in patterns and quality.

Persons wishing Rugs to match any carpet, will find desirable patterns by calling on the subscriber, and can have manufactured for them at short notice any variety of patterns they can wish, by leaving them at 414 Washington street. sept 4 ELIAR STONE BREWER.

BROOKS' PATENT SILK SPINNER.

THE public attention is invited to this machine. It is adapted to domestic use, is simple in its construction, occupies a small space, and may be used to advantage by women and children. This machine may be obtained by applying to T. R. NEWELL, at the Agricultural Warehouse, No. 52 North Market street, Boston; or to the Patentee, ADAM BROOKS. SCITUATE, July 22, 1833.

BOOKS.

Books upon Agriculture, Horticulture, and Rural Economy, Published and for sale by Geo. C. Barrett, N. E. Farmer Office, 52 North Market st. Wholesale and Retail Booksellers supplied on very liberal terms, and their orders solicited. aug 14

NEW ENGLAND FARMER'S ALMANAC FOR 1834.

NOW in Press, and will soon be published the *New England Farmer's Almanac* for 1834, by THOS. G. FESSENDEN, Editor of the *New England Farmer*, and will be for sale Wholesale and Retail, by Geo. C. BARRETT, at the N. E. Farmer office. Dealers supplied on very low terms, and orders are solicited early.

The flattering reception and extensive circulation of the six first numbers have induced the publishers to render the 7th No. as useful and interesting as possible. tf a 14

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of *Fruits, Grapes, Ornamental Shrubs, and Flowers*, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

GENTLEMAN'S POCKET FARRIER.

For sale at the Farmer Office, showing how to use your Horse on a journey; and what remedies are proper for common accidents which may befall him; by F. Tuffnell, Veterinary Surgeon. Price 15 cents. july 17

YOUNG MEN AND YOUNG WOMEN.

COBBETT'S ADVICE to Young Men, and incidentally to Young Women, in a Series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a Subject—268 pages, price 56 cents—for sale at the N. E. Farmer office, 52, North Market street. aug 28

FARMER'S OWN BOOK.

For sale at the New England Farmer office the *Farmer's Own Book* or Family Receipts. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 50 cents.

TO SUBSCRIBERS.

Subscribers to the *New England Farmer* are informed that they can have their volumes neatly half-bound and lettered, at 75 cents per volume, by leaving them at the Farmer Office. july 17

BRIGHTON MARKET.—MONDAY, SEPT. 2, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 475 Beef Cattle, 12 Cows and Calves, about 2500 Sheep and 630 Swine.

PRICES. *Beef Cattle.*—Sales quick, and last week's prices were fully supported; some qualities sold a little better. We quote prime at \$5 25 a 5 75; good at 4 75 a 5 25; thin at 3 25 a 4 25.

Cows and Calves. Dull: sales were effected at \$19, 21, 22, 24 and 25.

Sheep.—In better demand than they have been for several weeks past. Lots were taken at \$1 25, 1 57, 1 50, 1 67, 1 75, 2 00, 2 12, 2 25 and 2 33.

Swine.—A lot of about 400, on a contract, were taken at 5c; at retail 5c for Sows and 6c for Barrows.

MISCELLANY.

From the Greenfield Gazette.

[The following Ode was sung a few weeks since by an old gentleman on board a canal boat in New York, at a place where the demon is freely worshipped. It created some little stir among the flagon-votaries, to hear their Dagon so rebuked on his own ground. A gentleman from this quarter, who happened to be present, was pleased with the occurrence, and procured several copies of the Ode, one of which he has sent us for publication.]

TEMPERANCE ODE.

Ye sons of Columbia, your Freedom assert,
In contest engage with the foes of the nation,
This rum-selling trade has done us much hurt,
Caused widows to weep with great consternation;

The old and the young,
Deluded have been,
While drunkards have died again and again.

O, ne'er may the sons of Columbia deplore,
The loss of their freedom till time is no more.

Ye young men and maidens, look up and behold,
This Temperance Reform, your country's salvation;
Health, comfort and peace, more precious than gold,
Shall dwell in all dwellings throughout the whole nation:

And though drunkards are sad,
And merchants get mad,
The hearts of all good men will ever be glad.
O, ne'er may the sons of Columbia deplore
The loss of their freedom till time is no more.

Hail Temp'rance Reform, Humanity cries,
Thy banner is waving both sides of the ocean;
The world very soon will reform and be wise.
For none can help seeing the drunken man's portion;
To aid the blest cause,
Without human laws,
See the Angel of Death close the drunken man's jaws,
O, ne'er may the sons of Columbia be slaves,
While the earth bears a plant or the sea rolls its waves.

Should Satan again, to poison the world,
Encourage the practice of rum-distillation,
And merchants to aid him, with banners unfurled,
Grow bold in their sin all over the nation,
The two-edged sword,
From the mouth of the LORD,
Will ever afford strict Temp'rance a GUARD.
And ne'er shall the sons of Columbia be slaves,
While the earth bears a plant, or the sea rolls its waves.

THE WAY TO GET COOL.

A LUDICROUS mishap befel an unfortunate toper the other day, in the vicinity of Brandywine Bridge. The day being warm, and the gentleman having been also pretty warmly engaged with the bottle, felt inclined to sleep, and no softer bed presenting itself, lodged himself on the stone parapet of the arch which spans the mill race. In this luxurious position he remained for some time, exposed to the rays of a burning sun, and to the assaults of all the bottle flies in the vicinity. Sleeping as he was, he displayed no little restiveness under the annoyance of these insects, till at length one, more daring than the rest, attracted by the rubicund glories of his nose, made a settlement on that prominent point, and so worked upon the feelings of the sleeper, that, raising his arm, and aiming a desperate blow to annihilate his tormentor, the unlucky wight lost his equilibrium, and fell from the parapet some eight or ten feet into the water below. It is supposed that he awoke when he got to the bottom of the mill race, as he was seen to gather himself from the water as fast as possible, and making for home, as Major Jack Downing would say, full chisel; as cool, and apparently as sober as a drowned rat.—*Delaware Journal.*

"Barney, leave the girls alone." A correspondent of the British Naval Chronicle, affirms that this musical bagatelle, owes its origin to the kiss publicly bestowed on the late Commodore Barney, by the beautiful Queen of France, on the occasion of his visit to Paris, after his gallant exploits at sea, in the war of the Revolution. The maids of honor were all so eager to follow the gracious example of the Queen, that it is said, the young American became thenceforth, an object of envy and dislike to all the beau monde at Court.

The bagatelle was composed by an Irish officer, who was present when the royal familiarity was exhibited.

Anecdote. "Why do you not pay me that six and eight pence, Mr. Mulroony?" said an attorney to an Irishman; who replied, "Why, faith, because I do not owe you that same." "Not owe it to me, yes you do, it's for an opinion you had of me." "That's a good one, indeed," replied Pat, "when I never had any opinion of you in all my life."

SELECT PROVERBS OF ALL NATIONS.

EAGLES fly alone, but sheep flock together.
Eggs of an hour, fish of ten, bread of a day,
wine of a year, a woman of fifteen, and a friend of thirty.

Every man is the architect of his own fortune.
Ever drunk, ever dry.

Every fool can find faults where a great many wise men can't mend.

Every one bastes the fat hog, while the lean one burns.

Every man bows to the bush he gets shelter of.
Fair maidens wear no purses.
Fair and softly goes far in a day.
Fair words break no bones, but foul words many a one.

False folks should have many witnesses.
Forbid a fool a thing and that he'll do.
For the rose the thorn is often plucked.
Fools make feasts and wise men eat them.

He who imagines he can do without the world, is much deceived—but he who fancies the world cannot do without him, is still more deceived.—*Mass. Spy.*

A PATRIARCH.

ONE day last week, we visited Mr. John Whitcomb, of Swanzeey, who will be 102 years old in December next, and spent a half hour with him very agreeably. His countenance is as fresh as most men's at 65, who are in good health. His hair presents the only indication of extreme age. He has resided on the same farm about 65 years. Since he unfortunately lost his spectacles, two or three years ago, he has not been able to read, and being pretty deaf, his great source of amusement, for the last ten years is dried up. Latterly his knees fail him, and it is with some difficulty that he gets about with his two staves. Otherwise his health is good, and his digestive powers ample for the simple food, bread and milk, on which from choice he has for the most part subsisted, (we so understood him) for 20 or 30 years. His extraordinary age is the result of temperance in eating and drinking. The old gentleman's memory is very good, especially as to events in his earlier years. He was a soldier in the war of '55. Being sick at Albany, he thought the use of tea was injurious, and for nearly 80 years he has refused to drink it. He was a soldier in the revolution, and receives a pension from Government.—*Keene Sentinel.*

FRUIT TREES.
ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 54 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Coelebs, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. optf

RUSSIA DIAPERS, at \$2 a Piece.

ELIAB STONE BREWER has just received 1000 pairs Russia Diaper 1-2 ell. Selected in Russia by Wm. Ropes, Esq. expressly for the retail trade of Boston, which are offered for sale for cash only, at 414 Washington Street. a 20

PETTICOAT ROBES, at 3s.

ELIAB STONE BREWER has just received 500 three breadth Petticoat Robes for 3s. For cash only at 414 Washington St. a 20

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

COMMUNICATIONS.

CULTURE OF WHEAT.....No. IV.

WE now approach the important inquiry, whether any thing, and if any thing what can be done to secure wheat from the blight, so far as this blight is connected with the weather. Mere conjectures in agriculture can attract only the ignorant, the credulous, and the uninitiated. But we shall rest only in conclusions plainly deducible from observation and experience.

Early sowing, from the best observation which I have made of the wheat crops, which have come under my notice, from the united and decided opinion of the British wheat-growers, and from many American authorities, is to be strongly advised. The reason is obvious. The wheat crop should be as far advanced in the spring as possible, that it may perfect its seed before the hot and sultry weather usual in July.

Your correspondent, Mr. Ferry, in the N. E. Farmer of the 7th ult. says, "The white flint or bald wheat, being about ten days later than the bearded wheat, was badly blasted, while the latter is generally good.

Jeremiah Wadsworth, Esq. of Hartford, Conn. in 1798 writes, "In my other field all the crops were good and fit for the sickle from the 1st to the 16th July, except one piece of two acres in a stiff moist clay after Indian corn, put into the ground the 1st November; this was very much shrunk. In an adjoining field of pasture ground were many barberry bushes, which might have been the cause of this blast; but I am satisfied it will not do well to put this wheat in the ground after the middle of October; that which was sown early in September was the best."

James Hillhouse, Esq. of New Haven, Conn. in 1797 writes, "The Virginia wheat headed ten or fifteen days earlier than the other, was ripe sooner, and when harvested was plump: the other was almost ruined by blast, and *where separated from the early wheat by a furrow only, the blast was as great as in any part of the field.*"† This last remark deserves particular attention. These two gentlemen are of the highest authority.

Justin Ely, Esq. of West Springfield, whose crop was before referred to, remarks in speaking of his wheat crop, "It ripened so early as to be harvested a few days sooner than any crop of rye in the vicinity; to this circumstance of its ripening thus early before the nights get to be warm, is imputed the security of this kind of wheat from blasting. This crop equalled 36 bushels to the acre. A single acre produced more than forty bushels.‡ The average weight 64 lbs. to the bushel.

The English authorities are to the same point. An English writer, as far back as the year 1681, (as quoted by Sinclair) says, the sowing of wheat early hath been esteemed, and doubtless is, the best remedy against *mildews*, by which means the wheat will be filled in the ear before they fall, and your increase will be much more: as for curiosity's sake, wheat was sown in all the months of the year: that sown in July produced such an in-

crease, that it is almost incredible."* Many other authorities equally decisive, and results of actual experiments and long observation might be quoted, but I fear being tedious.

In the next place high manuring, especially the year of sowing the wheat is not advisable; because when the growth is very luxuriant the grain is more liable to lodge, which always exposes it to injury; the air has a less free circulation among it, which occasions it to retain moisture longer; and its luxuriance may be supposed to render it more liable to disease, as the full and crowded habit of the *bon vivant*, the gross and corpulent, renders them much more liable to acute, violent, and fatal disorders than the man of a more thin, abstemious, and moderate habit. In all epidemics such men are found peculiarly susceptible of disease, and are commonly the first victims.

As to the particular manure to be applied to the crop and the proper time of applying it, there is a great variety of practice, and with almost equal success; some giving it to the preceding crops, and others applying it to the crop itself. I shall suggest no theory of its operation; facts are all that are important; mere speculations in matters of practical science are often much worse than useless. Nature envelopes her hidden operations by a veil of mystery, which man's sagacity attempts in vain to raise. We soon reach the barrier beyond which all is utter darkness; and no finite mind can penetrate.

In regard to the suggestion of your most respectable correspondent B. that our primitive soil is deficient in the specific food of the wheat plant, which he gives merely as theory, I can only say, the proof is wanting. As it respects likewise your own positive assertion, that lime is *indispensable* to the wheat crop, or "that without lime or some alkaline substitute, a wheat crop *must* fail, though with it, it *may* fail," accustomed as I am to respect the intelligent authority from which this declaration emanates, I must still demur, because the proof is wanting. The conjecture of the most respectable writer, Agricola, of Nova Scotia, that lime is as necessary to form the wheat as it is to form the shell of the egg, is certainly very amusing; but I believe after all it is mere moonshine. Where is to be found a chemical analysis of wheat, either the grain or the straw? Perhaps you can assist me in a search, which I have made in vain. What is the proof that lime is an important constituent either of the straw or the grain of wheat; and if it exists at all, in what proportion and how compounded; and does it more exist there than in Indian corn, where it is found in a very small proportion, according to Dr. Gorham's analysis, in the form of a phosphate.†

* Husbandry of Scotland, vol. ii, p. 141 Appendix.

† By the Editor. We did not rely on the authority of Agricola alone when we stated that we believed lime to be *indispensable* for the production of wheat; but quoted Anderson, see N. E. Farmer, vol. xii. p. 38; Dickson, ib. p. 38; Grisenwaite, ib. p. 46, and Loudon, ib. p. 38. With regard to lime being found in wheat by analysis, we can at present place our hands on the following authorities only, though we think others may be adduced:

Sir Humphry Davy in speaking of Phosphate of Lime, says, "It forms the greatest part of calcined bones. It exists in most

I am perfectly apprized of the value of lime as a manure; and of the fact that certain fields after its application have borne good crops of wheat, which before were incapable of producing it. But in spite of all the fine-spun theories which have been invented on the subject, the true mode of its operation is as much concealed as the actual process of digestion in the human stomach, and the various divisions and dispositions of the food after it is received into this secret, complicated, and wonderful laboratory. If in many instances lime has been applied with extraordinary success, there are others in which it has produced no apparent effect; and many in which its effects have been positively and permanently injurious. The English writers speak of the application of one hundred, three hundred, and even seven hundred bushels to the acre. These are remarkable quantities compared with any thing to which we are accustomed; and the application of a mere sprinkling to the seed, or as Anderson remarks, of a thousandth part of the weight of the seed to an acre, seems very trifling and insignificant.*

Brown of Markle, says, "the propriety of applying lime on old arable lands has been questioned, and with much justice by the most part of practical agriculturists, and their doubts on that head are confirmed by the fullest experience.† He adds, that after having been in the regular habit of applying considerable quantities of lime for above thirty years, indeed few of the profession have used more of this useful article, that in the majority of cases the application has been highly beneficial, changing in a manner the very nature of the soil, and causing it to produce the most abundant crops, whereas in others it has been altogether useless, and in some instances followed by mischief instead of benefit. Strong loams and clays require a full dose to bring them into action, such soils being capable of absorbing a great quantity of calcareous matter. Lighter soils, however, require less time to stimulate them, and may be injured by administering a quantity that would prove moderately beneficial to those of a heavy nature."

excrementitious substances, and is found both in the straw and grain of wheat," &c.—Lec. vii. p. 299, N. York ed.

"Several of the earthy and alkaline matters exist very frequently amongst the materials of vegetables. Silice is found in almost all their ashes. Alumine exists in them. Lime is much more abundant in them, and is found especially combined in the sulphuric, phosphoric, or carbonic acids."—Nicholson's Fourcroy, vol. viii. p. 137.

* Dr. Anderson's expressions are "Perhaps the proportion of calcareous matter did not, in this case, amount to more than one thousandth part of the whole, yet the qualities of the soil were thereby totally altered, inasmuch that though before the application of that dressing, the soil was incapable of producing wheat at all, it was found at all times after that period well adapted for the raising of this crop. Nature has formed many soils with a similar proportion of calcareous matter, blended imperceptibly in them, over large districts of land." Anderson's Recreations, vol. i. p. 16. We believe that Dr. A. by "one thousandth part of the whole" meant a quantity equal to one thousandth part of the mould or earth within reach of the roots of the plants. Larger quantities might be beneficial as manure, or a constituent of the soil, but a little was indispensable to form a constituent of the wheat plant, which, if our theory is correct, cannot be perfected without a portion of lime.

† Treatise on Rural Affairs, vol. i, p. 418.

* Mass. Agr. Papers, for 1799.

† Ibid, p. 74.

‡ Ibid, for 1803, p. 73.

The opinions of such an experienced and intelligent cultivator as this show how hazardous would be the indiscriminate application of lime to various soils, valuable as the manure is admitted to be where it may be properly applied.

Sir Humphry Davy remarks, that "when a soil deficient in calcareous matter contains much soluble vegetable manure, the application of quick lime should always be avoided, as it either tends to decompose the soluble matters by uniting to them carbon and oxygen, so as to become mild lime; or it combines with the soluble matters, and forms compounds having less attraction for water than the pure vegetable substance." Then again he adds, "Lime should never be applied with animal manures unless they are too rich, or for the purpose of preventing noxious effluvia. It is injurious when mixed with any common dung, and tends to render the extractive matter absolutely insoluble."

Such are the opinions of most competent judges on the use of lime, of whose extraordinary value as a manure or stimulant to the soil there is no question; and such opinions render us cautious in regard to its indiscriminate application, or in coming to the conclusion that it is indispensable in all cases to the successful culture of wheat.

Let us now come to the facts in the case. Mr. Pomroy has never applied any lime to his grounds or seeds in any form. Mr. Arms none. Mr. Wadsworth none. Mr. Hillhouse none. The great Springfield crop had none. Mr. Justin Ely speaks of sprinkling his seed with lime, using about eight quarts to a bushel, though his first crops were sprinkled with gypsum, which is generally considered of no advantage to wheat. Col. Wilson merely sprinkled his seed: this did not, however, secure it from blight. Mr. Leavitt sprinkled his seed, and applied about five bushels of air slacked lime to an acre: this wheat, however, suffered considerably from blight. Mr. Wells sprinkled none upon his seed, but spread about two hogheads upon his winter wheat in the spring. He says, however, he is not sensible of any advantage from it.

Mr. Wells states another fact, which bears upon this matter very strongly. He had been accustomed to sow spring wheat for years; but not well satisfied with the kind which he had usually sowed, he procured a bushel of wheat the last spring from store, very highly extolled, and sowed it by the side of some of his own spring wheat, known generally as Leghorn wheat. Upon the land on which his store wheat was sown he put on a very considerable dressing of lime the last spring; but he assures me that the produce of this land was not nearly so good as that which lay at the side of it, on which he sowed his Leghorn wheat, and upon which no lime had been placed.

My own experience this year indicates a similar result. On 11th April, I sowed a piece of spring wheat on some of the best alluvial land on my farm. The most westerly strip through the piece containing about 45 rods, was first manured with coarse barn manure, and then limed; 2 hogheads of lime having been slacked and spread as evenly as possible with shovels from the cart. The seed was washed in brine, and sprinkled with lime, and sowed at the rate of two bushels to an acre. The second strip next easterly to the above was manured with barn manure, spread after ploughing, harrowed and sowed with one bushel of the same wheat, upon which melted tallow was first poured, and

then the seed, after being well coated with tallow, well adapted to furnish nitrogen, sprinkled with lime: quantity of land about 83 rods. The next strip easterly, containing about one acre, was manured with barn manure spread, the seed washed in brine, and then sprinkled with lime, and sowed at the rate of two bushels to the acre. Now the result was that the produce of the first two pieces was not, judging from the appearance and the number of shocks, even half equal to the land on which no lime was spread. No apparent advantage was derived from the tallow applied; but the germination of the seed was considerably delayed by it. I know no difference in the aspect or condition of these three pieces of land other than what is stated, excepting that on the two former pieces Indian corn was grown the last year, on the latter potatoes. There is little doubt that potatoes are more favorable to wheat than Indian corn; but whether the difference in the produce is ascribable to the potatoes preceding the crop, or the application of lime, others from the above facts can form an opinion for themselves. The ground was very foul with cadluc, a most troublesome weed in our meadows.

Wm. Wells, Esq. above referred to, is one of our most experienced and intelligent farmers. The land on which his winter wheat was raised, yielding 25 bushels to the acre, has been tilled, constantly with the exception of one year, for forty years. The year before the last it was in Indian corn; the last year in oats. For wheat, it was last fall manured with twenty-two loads drawn by one yoke of oxen of light strawy barn manure. He applied one load of leached ashes to a part of the field. On this the growth of straw was more luxuriant; but he thinks there was no superiority in the yield of grain. For corn it has been manured in the hill. Mr. Wells' opinion is entitled to great consideration. He has every year, for many years, cultivated wheat. He attributes its failure in many cases to our open winters, which have prevailed more since the country became cleared than formerly.

I submit the above observations and facts, Mr. Editor, to your consideration. I have no ambition to establish any theory; but am anxious to make only such deductions as facts will warrant. Highly as lime is to be esteemed as a manure, and its extraordinary value has been long since incontrovertibly established, yet it is apparent, that its application is not to be indiscriminately recommended; and that it is indispensable with us to the raising of wheat, and its deficiency in our soil the great cause of the failure of our wheat crops, are positions which in my humble opinion need confirmation. There is good reason to believe that our soil is not ill adapted to the growth of this valuable grain; that with ordinary care and labor it will succeed as often with us as in most other countries; and though the usual product may not in the opinion of many justify the expense and labor of cultivation, yet it is gratifying to believe that even in this matter New England has within itself the ample means of independence.

Meadowbanks, Deerfield, Aug. 26, 1833.

FARMING.

Windsor, (Conn.) Aug. 29th 1833.

T. G. FESSENDEN, Esq.—Dear Sir, In the Northampton Courier of July 31st, 1833, which has accidentally fallen in my way, I have read with some

interest an article on agriculture copied from the N. E. Farmer, dated Westborough, 1833, signed Samuel Chamberlain, and stating an account of the productions of a farm for one year, the sum total of which, including dairy, beef and pork amounts to \$2394.47½.

Giving publicity to the skilful and successful management of farms, and extraordinary productions in agriculture, has a happy tendency in exciting in others a spirit of laudable emulation, and extending the boundaries of agricultural science and rural economy.

On subjects so interesting to the community, it is believed many agricultural gentlemen, practical farmers, have been too sparing of their talents and of their ink, in laying before the public, results of their improvements and successful experiments, accompanied by their own reasonings and remarks.

Had Mr. Chamberlain gone more into detail in the description of the farm and stock, quantity of land and method of cultivation, manuring, &c. age of the swine when slaughtered, and every other important particular, which contributed to so great a product, his account would have been read with a deeper interest, and been better calculated to afford instruction and benefit to others.

Considerations of this character, suggested to my mind by the perusal of Mr. C.'s account will, I hope, serve as an apology for communicating to you a statement of facts relative to a small section of the farm owned by Gen. Charles Jencks, at Warehouse Point, East Windsor, a gentleman with whom for many years I have been acquainted.

Having business which led me to that place on Monday last, and feeling an inclination to view the premises in question, I called on Mr. J. who with his usual politeness, gratified my curiosity in walking over his grounds.—From him and from others now employed in his service, all entitled to the fullest credit, accompanied by my own view, so far as relates to present appearances, I am prepared to present the following account.

Woad produced last year on 5 acres of ground, 12 tons.

Tobacco planted this year, 31 acres.

Tenzles cropped this year, 8 acres.

Woad seed collected on somewhat less than half an acre of ground, 100 bushels measured.—On the same ground is now standing a heavy crop of tobacco. The growth of tobacco on the whole 31 acres is unusually large, and is estimated by competent judges of the article, to yield not less than one ton to the acre when cured and ready for the market.—His tobacco sheds on the premises are of the following dimensions, viz:—

One of 102 feet by 30—3 stories high.

" " 70 " " 18—3 " "

" " 62 " " 24—3 " "

" " 60 " " 40—4 " "

" " 38 " " 40—3 " "

and one other erected the present season in the form of an L, 567 feet long and 24 broad, 3 stories high.

The whole amounting to 899 feet in length with their various widths and heights.—All these are supposed to be but barely sufficient to contain for curing the present crop, the cutting of which is this day begun. One fact connected with the raising and finishing the long shed, of the truth of which I was assured by the master-workman, is deserving of particular notice—namely, that during the whole time of performing that labor no ardent spirit was furnished to any person employed in it.

In addition to the stock on his farm Gen. Jencks has now 87 shoats about 3 months old, weighing from 30 to 80 lbs. each, 80 of which he wishes to sell. These are $\frac{3}{4}$, $\frac{1}{2}$ and $\frac{1}{4}$ breeds crossed with the Spanish breed imported into this neighborhood two years since from Malaga. This breed, where known is esteemed superior to any other in the United States.

My limited knowledge of the value of the different articles of produce here mentioned, forbids my presuming to offer any estimate, but none will hesitate in awarding a premium of credit so justly due to the skill and enterprise of this distinguished agriculturist and rural economist.

Very respectfully yours,

SAMUEL WOODRUFF.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUIT AT THE MASS. HORT. SOC. ROOMS.

Saturday, Sept. 7, 1833.

THE exhibition of fruits which took place this day was very fine, particularly the pears.

Apples. A basket of large red apples from Oliver Johnson, Sterling. Fine sweet apples for baking, from H. Cowing, jun. Roxbury. An apple of fine flavor, called the Coach Whip, by Henry Sheaf, Esq. Summer Pearmain, remarkably good, by E. M. Richards, Dedham. Porter apples, a fine basket of which were presented for the horticultural dinner, by Lawson Buckminster, Framingham. Gloria Mundi apple, by H. Cowing, jr. Roxbury.

Pears. By P. B. Hovey of Cambridgeport, fine specimens of the Bartlett and Bergamot pears; the particular name of the latter lost. By John Prince, Esq. of Roxbury, the Rambour d'ete. By S. A. Shurtleff of Boston, the Rouselette de Rheims pear. By John Heard, Jr. Esq. fine specimens of Williams' Bonchretien, (called the Bartlett,) Sugar, and Harvard pears. By Mr. Hanners, a French pear from his garden, name unknown. By Enoch Bartlett, Esq. two specimens of pears, good and fair, names unknown. By J. H. Billings, Roxbury, pears of large size and good flavor, name unknown. By Joseph Morton, Esq. Milton, a seedling pear, a great bearer worth cultivating. The Committee gave it the name of Morton Seedling.

Peaches. By Miss Watson, Charter-street, Boston, seedling peach of large size. By Mr. Joseph Stetson, Waltham, seedling peaches. By Mr. William Kenrick, Newton, Washington free stone peach, very fine flavor and great bearer; Van Zandt's peaches, fine flavor; Mignonne peach, beautiful and good. By C. Cowing, Roxbury, Oldmixon, Red Rarieripe, and Princess Charlotte, from Hartford, very fine. By James Eustis, South Reading, five varieties of peaches, fair. By Lawson Buckminster, Framingham, English Rarieripes, good peach. By E. Vose, Dorchester, two varieties of peaches. By Thomas Mason, Charlestown Vineyard, the Royal Alberge, Gross Mignonne, Royal George, Royal Kensington, Royal and Bellegarde peaches.

Nectarines. By Thomas Mason, the Elruge. By Ex-President Adams, Quincy, five Nectarines, seedlings.

Plums. By R. Manning, Salem, the Spanish Damask, Red Pedrigon, for drying, and Bleecker's German Gage plums, latter very fine. By P. B. Hovey, Cooper's large red plum, superior. By

Ira Burnham, Egg plum for premium, from the garden of the Hon. J. Hunnewell.

Nuts. A nut resembling a filbert, from James Brown, West Cambridge.

Per order of the Committee, S. A. SHURTLEFF.

EXHIBITION OF FLOWERS.

DAVID HAGGERSTON, Society's Garden, Mount Auburn—Amonobium alatum, Enothera densiflora, do. Lindleyana, Schizanthus pinnatus, Molope malacoides, Dracocephalum moldavica, do. var. albiflorum, Thunbergia alata: Dahlias—Coccinea superba, Nuttallii, Vulcan, Prince Leopold, Rainbow, Double Buff, Florabundana, Hurd's Favorite, Scarlet Turban, &c.

WM. KENRICK, Newton, Roses—Star formed Noisette, Noisette, Champney's blush cluster, Grandval or Hermite, Undulata, Pourpre obscure, Belle Italiene, &c. &c.: Tradescantia blue red and white, Larkspur grandiflora and other varieties Phlox var., Asters, Helianthus multiflora, Malva rosea, Verbascum, Nasturtium, Balsams, Gilliflowers, Enothera fraseri, Honeysuckles, Corchorus japonica, Dracocephalum, Rudbeckia purple and yellow, Bignonia radicans and grandiflora, Snowberry. Also, 14 varieties of beautiful Altheas, of different shades: varieties of Dahlias.

S. WALKER, Roxbury—Matricaria parthenium, China aster, Funkia subcordata, Salvia splendens, Amaranthus tricolor, Gomphrea globosa, Zinnia elegans, Euphorbia, Chioscoca, Scabiosa atropurpurea, Asclepias tuberosa, Helianthus flore pleno, Dracocephalum virginianum, Delphinium elatum, Grandiflorum, Sinensis, Veronica virginica, Siberica, Verbena aubletia, Tradescantia virginica, Alba, Mesembryanthemum, Althea frutex, Iberis gibraltarica, Alba, Coreopsis auriculata, Tinctoria, Lanceolata, Phlox paniculata, &c. &c.: Dahlias—Hall's mogul, Coccinea speciosissima, Colvill's perfecta, Foster's incomparable, Squibb's pure yellow, Walker's Mary Louisa (seedling), Wells' Royal Lilac, Dennisii, Le Brilliant, Romulus.

THOMAS MASON, Charlestown Vineyard, 14 varieties of Dahlias, with other kinds of flowers.

CHARLES M. HOVEY, Cambridgeport, fine specimens Callistema multiplex, &c.

Messrs. WINSHIP, a collection of flowers, among which were the following kinds—Dracocephalum speciosa, Achillea ptarmica, Fumaria virginica, Cucubalus behem, Spirea stipulacea, Phlox carolina, do. Scabra, do. Suaveolens seretina, Euphorbia corolata, Saponaria officinalis, Asclepias fruticosa, and curasivica, Nepeta variegata.

The Exhibition of Horticultural Productions, has not been surpassed, if equalled by any former weekly display. In the flower department, Messrs. Haggerston, Walker, Kenrick, Mason, and Hovey, were conspicuous competitors, and showed fine specimens of splendid flowers to the gratification of those present, particularly the ladies, who sanctioned by their presence the exhibition, and the refined taste and excellent judgment evinced by them will doubtless have a tendency to stimulate the practical horticulturist to greater exertion. And we confidently hope further to enlist in Flora's cause the courtesy of him who

"Learns of the little Nautilus to sail,
Spreads the thin web to catch the driving gale;"

and who unfurls the star-spangled banner in foreign climes, to bring home from the shade unseen the sweet flower, to impart its fragrance on his native home.

By order of the Committee,

JONA. WINSHIP, Chairman.

Mr. Joshua Child of Boston, Mr. Joseph Stetson of Waltham, and Mr. Charles M. Hovey of Cambridge, were elected Members of the Society.

The Annual Celebration will take place on Wednesday the 18th inst. The following gentlemen constitute the Committee of Arrangements: Zebedee Cooke, Jr. E. Vose, S. A. Shurtleff, David Haggerston, Jonathan Winship, E. M. Richards, B. V. French, G. W. Pratt, Robert Manning, E. A. Story, Enoch Bartlett, Wm. Kenrick, Samuel Walker.

WORCESTER MANUAL LABOR HIGH SCHOOL.

THE Committee for superintending the arrangements of the premises for the organization and operation of this proposed school, is composed of the following gentlemen:—Isaac Davis, Esq. of Worcester, Joseph White, Esq. of West Boylston, Otis Corbett, Esq. of Worcester, Col. Edward Phillips, of Sturbridge, and Rev. Otis Converse, of Grafton. They have purchased a tract of land of about 60 acres, embracing a beautiful elevation in the southern part of the village, on the Brookfield road. A three story house, of wood, with out buildings, has been erected, and is in progress towards completion, for the use and occupancy of the steward, who will board all the pupils in his family. The academic building will stand on a line with the steward's house, in the rear of an enclosed square, about twenty rods from the street; and will be 60 feet by 42, and 3 stories high; the basement story of stone, and the two stories above of brick. The entrance to be through a retreating vestibule in the centre of the front, shaded by a portico of the Doric order, resting on four pillars 2½ feet in diameter and 21 feet shaft, and fluted. On each side of the vestibule there will be private rooms for the accommodation of the Instructors. The school room will be 60 feet by 30, lighted by windows in the rear and ends of the building, and will afford accommodation for 150 students. The plan of the grounds embraces reserved lots for the erection of such shops as may be necessary to carry into effect the system of manual labor, and other buildings that may be required for the convenience and accommodation of the school. Although this school will owe its existence mainly to the liberality and energy of the Baptist denomination, yet we assure the public that there will be nothing sectarian in its character. The Committee will expend about \$12,000 before the first of April next, when it is expected that the school will be opened. An act of incorporation will be obtained at the next session of the Legislature; the school be placed under the control of trustees; and the course of study, government, and discipline, be established on broad and liberal principles.—*Worcester Aegis*.

A splendid Animal. There is now exhibiting in Portland (Me.) a bull, seven years old, weighing 3,500 lbs. He measures 11 feet 9 inches from his nose to his tail, girths 9 feet, and is 5 feet 8 inches in height. He is of the improved short horned Durham breed.

Hair Restorative. It has been ascertained that the daily application of salt will restore hair to the heads of those, who, from fever or other causes, may have suffered its loss. The constant application of salt has been found to give strength, and luxuriance to hair which was falling off, and causing rapid baldness. This is a simple and cheap remedy worth trying.—*Domestic Ecyc.*

From the Boston Courier.

Dr. WATERHOUSE on MALIGNANT CHOLERA.

A PUBLIC CAUTION should not be construed a public alarm. I know not a single case of malignant cholera in Massachusetts the current year, nor do I believe that there is a single case of it in all New-England. The vigilant and wary city of Boston is reaping the reward of its prudence in point of cleanliness, and I believe, sobriety. Nevertheless it may not be amiss to give a cautionary hint at this season, as it regards the young and the thoughtless on an apparently trivial subject, which depends more on the care of parents than on the vigilance of the public authorities. I allude to the eating of fruit in an unripe state—fruit in its crude, half finished state. We include under this head green corn, green apples, pears, melons and cucumbers.

I am often asked—"Dr. is such and such a fruit wholesome?" I answer "yes, every vegetable carried to market is wholesome, eaten at a proper time of its growth, or, if it grows under ground, prepared by fire in a proper manner." We have a little loaf of bread growing a few inches under ground, in vast plenty every where, from Nova Scotia to South America, whence it originally came, with neither useless core, husk or shell, with only a thin skin to keep out the dirt—all the rest being a roll, or small loaf of bread ready prepared for the embers, the pot, or the oven; for who can eat a raw potato? or earth-apple, as the French call it. We correct in a few minutes, the disagreeable acrimony of this now universal fruit, by roasting, baking, or boiling, when it becomes the wholesome food of millions. The same principle should be applied to pumpkins and squashes, and I should think to cucumbers; certainly to raw corn. I do not say that holy water, but holy fire must pass through them all, to make them salubrious.

Speaking generally, men are preserved in health by eating wholesome vegetables. And what is meant by a wholesome vegetable? I answer, a vegetable that is entirely, or wholly ripened, and thoroughly finished, by the operation of the sun and air if suspended in the atmosphere; or else, as in the potato, ripened or forwarded by aid of fire; by the art of man—the only cooking animal in creation. Esculent vegetables, that are fully ripe, are pronounced wholesome, because Nature or Providence, two words for the same idea, has completed the process in open sunshine, as in the grape, which no one ever thought of boiling. But experience has taught man to expedite ripeness by skillfully managing the operations of fire, in a dry or fluid form, as in cooking potatoes, apples, or green corn, by which they are changed, or ripened at once, so that the article which was crude and imperfect, becomes wholesome by that process.

An apple, therefore, plucked from the tree in a green state, is imperfect and but half-cooked, and every delicate stomach rejects it, and is disposed to rid itself of it by a sense of nausea or pain. But the stomachs of most young people are made to surmount almost every thing taken into them, yet rarely without some injury. Every growing or unripe fruit, has a vegetative life of its own, which protects it at first from the solvent power of the gastric fluid, as in eating green gooseberries or currants, and some other green fruit; and this ill treatment of the stomach and intestines, manifests itself to the patient; yet is often surmounted in high health and in a salubrious state of the at-

mosphere. But when changed from that to a choleric constitution of the surrounding air, a single green apple, an ear of corn—a morsel of indigestible flour-pastry, may become the exciting cause of cholera; and, from a peculiar and inscrutable state of it, may assume the Asiatic type of malignancy. He who feeds on flesh, uses a food already assimilated to our nature. It is in harmony with our bodies; but he who takes into his digestive organs a vegetable, must destroy that vegetable quality, and approximate it to the animal juices; and the process of animalization in a languid stomach is rarely performed without disturbance; and that molestation invites cholera, when there exists a choleric constitution of the atmosphere. Hence the reader may perceive what a seemingly trifling substance may turn the balance of health in a fastidious stomach, and give existence to a rapidly fatal malady, without branding the article eaten with the name of unwholesome. Whence it appears that green apples, corn, or unripe melons taken into the stomach in a crude, unripe state, will light up a cholera in a person predisposed to it, by the peculiar, but unknown internal condition of his body, in co-operation with the equally inscrutable state of the atmosphere.

If I have made myself understood in this short essay on a recondite subject, which requires twice as many words to do it justice, the lesson to be drawn from it will be to avoid eating fruit in its green or imperfect state; but correct its unhealthy crudity by the artificial ripening of culinary fire, in boiling, or baking, provided you do not include flour paste in the mess; always bearing in mind that whatever causes the sense of sickness, pain, sourness, or eructations of any kind, or a disagreeable sense of fulness—all, or either, are indications that the prime organ of health and comfort, the stomach, is in a condition to catch the evil temperament, or unhealthy state of the atmosphere. And may we always remember that OBSTACLES, is as good a rule in physic, as it is wise in morals. ["Meet the first beginnings of evil: or meet the disorder in the outset."] B. W.

Cambridge, Aug. 24, 1833.

EARLY RISING.

EARLY rising is a habit so easily acquired, so necessary to the despatch of every business, so advantageous to health, and so important to devotion, that, except in cases of necessity, it cannot be dispensed with by any prudent and diligent man.

Thanks be to the goodness of God, and the fostering hands of our kind parents, this habit is so formed in some of us, that we should think it a cruel punishment to be confined to our beds after the usual hour. Let us prize and preserve this profitable practice; and let us habituate all our children and servants to consider lying in a bed after daylight, as one of the ills of the aged and the sick, and not as an enjoyment to people in a state of perfect health.

If any of us has been so unfortunate as to have acquired the idle habit of lying late in bed, let us get rid of it. Nothing is easier. A habit is nothing but a repetition of single acts; and bad habits are to be broke as they were formed, that is, by degrees. Let a person accustomed to sleep till eight in the morning, rise the first week in April at a quarter before eight, the second week at half after seven, the third at a quarter after seven, and the fourth at seven: let him continue this method till the end of July, subtracting one quarter of an

hour each week from sleep, and he will accomplish the work that at first sight appears so difficult. It is not a stride, it is a succession of short steps, that conveys us from the foot to the top of a mountain. Early rising is a great gain of time; and should the learner just now supposed, rise all the harvest month at four instead of eight, he would make that month equal to five weeks of his former indolent life.

Country business cannot be despatched without early rising. In spring, summer, and autumn, the cool of the morning is the time both for the pleasure and riddance of work; and in the winter, the stores of the year are to be prepared for sale, and carried to market. The crop of next year, too, is to be set or prepared for. Every business worth doing at all, is worth doing well; and as most businesses consist of a multiplicity of affairs, it is impossible to disentangle each from another, to put all in a regular train, and to arrange the whole so that nothing may be neglected, without coolness and clearness of thinking, as well as indefatigable application. The morning is necessary to all this; and the time and the manner of setting out, generally determines the success or the listlessness of the day. Besides, all businesses are subject to accidents, and to set forward early is to provide for the repair, if not for the prevention of them. It is a fine saying of Job, 'if my land cry against me, or the furrows thereof complain, let thistles grow instead of wheat, and cockle instead of barley.'

Lying long and late in bed impairs the health, generates diseases, and in the end destroys the lives of multitudes. It is an intemperance of the most pernicious kind, having nothing to recommend it, nothing to set against its ten thousand mischievous consequences, for to be asleep is to be dead for the time. This tyrannical habit attacks life in its essential power, it makes the blood forever its way, and creep lazy along the veins; it relaxes the fibres, unstrings the nerves, evaporates the animal spirits, saddens the soul, dulls the fancy, subdues and stupifies a man to such a degree, that he, the lord of the creation, hath no appetite for any thing in it, loathes labor, yawns for want of thought, trembles at the sight of a spider, and in the absence of that, at the creatures of his own gloomy imagination. In every view therefore, it was wise in the psalmist to say, 'My voice shall be heard in the morning.'

SKIN AND STOMACH.

LET these two important organs be attended to in a proper manner, and all the diseases of summer, cholera inclusive, will be avoided. The kind of attention to the skin consists in daily frictions with a coarse towel or flesh brush—the tepid or warm bath twice or at least once a week; or, in lieu of this, daily sponging the surface with salt and water with the chill taken off it, and then rubbing with a dry coarse towel. The stomach will have justice done it by an avoidance of alcoholic drinks, the moderate use of tea and coffee, if such be habitually taken; a due proportion of well boiled vegetables, with meat roasted or boiled—and on occasions in sanguine temperament, in a feverish habit of body, a moderate share of ripe cooked fruit—to the exclusion, however, of cherries and plums. In all cases where disease is present in a place, no kind of fruit, nor any new or unaccustomed article of diet whatever should be taken in the evening.—*Journal of Health.*

KENRICK'S ORCHARDIST.

WE are highly gratified to perceive, in Loudon's Magazine, of June last, the following candid and favorable notice of the *New American Orchardist* by our Countryman and Friend WILLIAM KENRICK.

This will prove a very valuable manual to those in America who addict themselves to the cultivation of fruits. It is for the Americans what Lindley's *Guide to the Orchard and Kitchen-Garden* is to the British, except that the present work confines itself to fruits. Its contents have been derived from considerable practical experience, research, and examination, in the subject, by the author and some friends of his; but it is still, in good proportion, a compilation from all the works which the author could procure on his subject, and the later of those published in England have been liberally drawn on. The author gives a list of the titles of the works he has had recourse to. There is a good deal of patriotism in the author's feeling; and he is anxious to promote the passion for, and emulation in gardening, which are now in America, on all sides kindling into resultful action. The book, too may prove useful to British gardeners, as a means of teaching them the qualities of certain American fruits. In the "Introduction" are these remarks:—"In England, however, they cannot duly appreciate the value of our native fruits, and those of other climates equally favored with us: their high northern latitude forbids it; although they have done wonders in counteracting the hostility of their seasons and climate. In their vast collection of fruits, which they have congregated from all climates, in their Horticultural Society's Garden, at Chiswick, I find, by the Society's catalogue for 1826, that they have at least fifty varieties of the native peaches of America, the selections from the extensive native orchards of this fruit, raised in the middle and western states for distillation. All these, so fine in our climate, so much admired by travellers, are, with but *two exceptions*, rejected as '*worthless*,' not being adapted to their latitude, and not arriving to their full maturity and excellence, even on the walls to which their cultivation is confined. (See vol. ii, No. 54, of the *Pomological Magazine*.) Other varieties of native fruit, so superior in our own climate, are by them almost as little noticed. The apples of America,—the fine selections during two centuries, from the innumerable native orchards." Not one syllable of the above may require a qualifying question: we would only, in perfect good humour, add an admired couplet from Goldsmith, which has now come to mind:

"Such is the patriot's boast where'er we roam,
His first best country ever is at home."

Another of Mr. Kenrick's remarks should be quoted:—"The temperature of our climate, on our extensive Atlantic coast, differs considerably from those parts of Europe and of Africa [which are] in corresponding latitudes." Towards the close of his book, the author sketches a list of foreign fruits, and foreign trees, "which may be cultivated in the south-western and southern states to the lat. of 25 deg." and adds, "Most of these, however, may flourish in the middle states; and a small portion may succeed in the north-western and eastern states to the latitude 43 deg."

The author dedicates his work "to the Hon. John Lowell, LL. D.," who has, during the twenty-five years past, been a distinguished promoter

of gardening and farming in America; and in the course of that time has "extensively disseminated many valuable productions—the donations from T. A. Knight, Esq. [President of the London Horticultural Society,] and from other sources."

ITEMS OF ECONOMY, ARTS, &c.

Splendid Bridge. Messrs. Gilson & Co. Reading, Penn. it is said, have entered into a contract for building a bridge over the Potomac river, at Washington city; for completing which they are to receive \$1,400,000. It will be one mile long—to have forty arches, 42 piers.

Flea-ology. Happening in the Drug store, in this place, a few days since, we found one of our citizens procuring of the gentleman of the "pestle and mortar" a prescription to keep his house clear of FLEAS! What think ye it was—Calomel or Arsenic, or some deadly poison? It was the sweet smelling oil of penny-royal, which, it seems, will, if sprinkled over the floor, make these troublesome little insects keep at a respectable distance. This appears to be preferable to the Irishman's mode of killing them, particularly when it is considered that oftentimes in "*putting your finger on them they ain't there*."—*St. Joseph's Beacon*.

Corns. A piece of tobacco, moistened with water, and bound upon the corn, acts as an effectual cure. We have tried it and found it so—have recommended it to many others who have found the same relief. If you are afflicted, bind on the weed, do not ape the Chinese, and we will warrant you free from corns in six months.—*N. H. Spectator*.

Beef. The drovers have begun to purchase grass-fed cows in this vicinity. We are informed that the price paid is not far from \$4.50 per 100, (probably short of that,) giving the owners about 8 dollars per head more than they paid for farrow cows in the spring.—*Northampton Gaz.*

Strange Animal. An animal of strange cognomen has repeatedly been seen in and about the woods at Hadley, (Upper Mills,) exciting no little curiosity in that vicinity. He is represented as larger than a Fox, of a brindled color, long hind legs and short front ones, and belongs to no species known about here. He is rather ferocious, and when seen in the road by two men between the Upper Mills and Sunderland, he growled angrily, and seemed disposed to act on the offensive. No hunters have been able to get a shot at him; but dogs have been vanquished, and they refuse to renew the attack again. He is thought to be a species of the Kangaroo, going upon his long hind legs, by skipping and jumping. A general hunt is to be attempted in a few days, and if successful we may learn something more minute about him.—*Northampton Courier*.

Milk Sickness. Mr. T. S. Hinde communicates to the Ohio State Journal, as the result of more than twenty years observation, that the cause of what is called the milk sickness is a wild vine resembling the poison oak vine. It grows as a shrub, is bushy at top; and in some instances attaches itself to trees, though not as firmly as a creeper. He says, "I have observed that the vine attached to trees bears a buff or yellowish berry, covered with a brownish skin. The present season having been wet, this vine is unusually plentiful, and cases of milk sickness have occurred earlier than common."

"Scot's Mountain against the World!" was the triumphant exclamation of neighbor Ferguson, while he held an oat straw in his fist, "6 feet 5½ inches above the root." Andrew Vansickle, Esq. left at our office an oat stalk, measuring 7 feet 5½ inches. This leaves Scot's Mountain 12 inches on the back ground. The straw may be seen at this office. Beat this who can.—*Belvidere N. J. Apollo*.

A disease is at present raging to a great extent amongst the cows in France. It is said that more than 20,000 have died.

Superior Intelligence of the Dog and Elephant. The dog is the only brute animal that dreams, and he and the elephant the only quadrupeds that understand looks. The elephant is the only animal that, besides man, feels sorrow; the dog the only quadruped that has been brought to speak. Leibnitz bears witness to a hound in Saxony, that could speak distinctly thirty words.—*Med. Gaz.*

Silver Mines of Mexico. From an article in the last number of Silliman's Journal, we learn that there are about 500 towns or principal places in Mexico, celebrated for the explorations of silver that surround them. These 500 places comprehend together about 3000 mines. The whole number of veins and masses in the exploration is between 4000 and 5000. The ore is generally in veins,—rarely in beds or masses. The vein of Guanaxuato is the most extensive. It is from 120 to 150 feet thick, and is explored in different places for a distance of nine miles. The quantity of silver in the ores average from 3 to 4 ounces the quintal, or from 1-448 to 1-597th of the weight of ore. The annual produce of silver in Mexico during the last years of the 17th century, was 1,134,424 lbs.

ST. JOHN'S WORT.

A correspondent of the Philadelphia U. S. Gazette, who writes from Bridgeport, N. J. under date of the 3d inst. says:—

I left Camden a few days since, where I had had my horse at livery, and had proceeded so far as the first watering place, when I made a discovery that startled me. My horse—a favorite, noble fellow—presented an appearance about the head that strongly reminded me of the bloody knobs of the pugilists who beat each other's heads into a jelly as a matter of science. His face was apparently bruised shockingly, the skin all off, and as red as a boiled lobster. My excessive agitation and alarm was somewhat moderated when able to understand the matter. It appears he must have been eating new hay, in which was mixed some leaves of that vile plant known as St. John's Wort, and wherever that comes in contact with the white hair and skin of a horse, it operates like poison, making it as raw as would aqua fortis, while that portion of the hair and skin which partakes of any other color than white is entirely exempt.

Of this strange fact I had often heard, but never before saw it manifested. It was an offensive sight to the merciful master of the noble animal; to see him throwing his head up, with his honest face like a raw beef-steak, broiling over hot Jersey sand and beneath a scorching sun; it was too much. It would be some consolation to witness a change of color, and this was immediately effected by a thorough basting with sturgeon oil and gunpowder, said to be a sovereign remedy; a fact I mention for the information of those who may happen to have their horses stripped of that necessary article—a hide.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 11, 1833.

TO SUBSCRIBERS.

WE would inform our Subscribers that in consequence of the transfer of the Proprietorship of the N. E. Farmer, some months since, it becomes desirable and necessary to settle all accounts previous to the commencement of the present volume.

The Farmer being much more expensive than most Papers, and not receiving support by advertisements, unless we are favored with early remittances we suffer. Those who wish to pay for vol. 12 in advance can pay our agents or remit any time during the present month.

Those who remit \$3, shall have the 50 cents carried to new account. Those Subscribers at a distance who are indebted for years back are very respectfully requested to remit by mail or otherwise.

To the many friends we have who have promoted the good cause, we return our sincere thanks,—we hold them all in grateful recollection.

SWINE.

THE following observations respecting this ugly, uncouth, but useful animal, are mostly condensed from a number of authors on both sides the Atlantic.

It is best to begin to fatten hogs the latter part of August or beginning of September, so that they may be fit for the butcher before the weather becomes very cold, as it is very difficult to put flesh on them in cold weather.

When you commence fattening swine care should be used not to give them more than they will eat with appetite. If they become cloyed their thriving is retarded, and there is danger from staggers and other diseases. Their troughs should be often replenished with a small quantity of food at a time, and kept always clean and well seasoned with salt.

An English farmer fattened 8 pigs in the following manner, which may be recommended in cases where a constant and regular attention cannot be given to feeding the animals. He placed two troughs in the sty: one he filled with raw potatoes, the other with peas, and gave no water. When the pigs were thirsty they ate the potatoes. In this way, it is probable that the animals would not only thrive without water, but needed no antimony, brimstone, nor other medical substances; for raw potatoes, being cooling and loosening, might serve at once for food and for physic. Instead of peas, perhaps dry Indian corn, or what would be better Indian meal, might be substituted. This mode of management with swine was first recommended in the N. E. Farmer of Aug. 6, 1824, and we are glad to find that it has been adopted by a writer for the Northern Farmer, [see our No. 7, p. 51.]

Cunningham, in his *Two Years in New South Wales* relates—"I had often heard it said among sailors that pigs would fatten on coals, and although I had observed them very fond of munching up the coals and cinders that came in their way, still I conceived they might relish them more as a condiment or medicine than as food, till I was assured by a worthy friend of mine, long in command of a ship, that he once knew of a pig's being lost for several weeks in a vessel he commanded, and it was at last found to have tumbled into the coal-

hole, and there lived all that period without a single morsel of any thing to feed on but coals: on being dragged out it was found as plump and fat as if it had been feasting on the most nutritious food. Another friend told me of a similar case, which came under his observation; and although these may be solitary instances, yet they serve at least to show the wonderful facility which the stomachs of certain animals possess of adapting their digestive powers to such an extraordinary species of food, and extracting wholesome nourishment therefrom. When we consider coal, however, to be a vegetable production, containing the constituent principles of fat, carbon, hydrogen and oxygen, our surprise ceases.

I always cause as many peas as I want for feeding my hogs, which are not a few in a year, to be regularly malted in the same manner, nearly, as my barley: this management has succeeded very well with me.

I have frequently given them to my horses, with which they agree very well, and are a heartening food.—*Museum Rusticum*, v. p. 110.

Young pigs require warm meat to make them grow. Corn and cold water will make them sleek and healthy; but warm beverage is considered requisite to a quick growth.—*Marshall's Inland Counties*.

Every sty should have a rubbing post. Having occasion to shift two hogs out of a sty without one, into another with a post, accidentally put up to support the roof, I had a full opportunity of observing its use. The animals when they went in were dirty, with broken ragged coats, and with dull heavy countenances. In a few days they cleared away their coats, cleaned their skins, and became sleeky haired; the enjoyment of the post was discernible even in their looks; in their liveliness and apparent contentment.—*Ibid*.

From experience I have found that swine prefer lucerne to clover. I have experienced that neither lucerne or clover of themselves are sufficient support for swine. A small quantity of corn, peas or beans, is certainly necessary to be given them.

I have applied potatoes in different modes for feeding swine; giving them whole or mashed in the water wherein they were boiled; or in the last mode, with barley meal scalded and mixed in the trough. But from various and repeated experiments I have found the following the most profitable method of applying potatoes, not only to the rearing, but likewise to the fattening of hogs; varying the quantity given according to the circumstances of rearing and fattening.

When rearing, a small quantity of food given once or twice a day, with lucerne, clover, grass and offals, is sufficient.

When fattening, a constant supply is essentially necessary, so as not to leave the troughs encumbered with stale food, which should be cleared out, and given to store swine.

An iron kettle is the most salutary for boiling potatoes. Should time or convenience not permit to have it emptied for several days, no bad consequence can ensue. Copper, or copper and lead, are extremely dangerous, as they generate poison; therefore they should be immediately emptied and cleaned.

The method I have always adopted and always shall pursue until a better is pointed out, is, to fill about three parts of a large kettle with potatoes: I scatter over them about a peck and a half of bar-

ley meal [or *Indian meal*], then fill the kettle with potatoes, adding just as much water as will cover them. Then the meal does not sink to the bottom of the kettle where it will encrust and burn, nor will it be liable to be wasted by boiling over. The nourishment of the meal is in a great degree extracted by the water. After the potatoes are well boiled, let the whole be mixed and bruised in tubs, with a clean spade, so as to form a pulp. By this method, all the nutritive powers of the meal and potatoes are incorporated, and thereby much easier digested, and the hogs require no water.

In cold weather it should be given blood warm. The swine while fattening should be kept as clean as possible, and well supplied with dry litter. Twice or thrice a week add about three table spoonfuls of salt to each half bushel of their food, which assists digestion and promotes appetite. When too much salt is given it acts as a purgative, which prevents the deriving of due nourishment from food.

About once a week I have mixed two table spoonfuls of madder, which prevents obstructions, acting as a diuretic and astringent. On some other day in the week, I give a spoonful or two of an equal quantity of flour of sulphur and saltpetre, well pounded and mixed, which purifies and cools the blood. These articles added to the food and given on separate days, entirely prevent measles, keep swine healthy, and cause them to fatten expeditiously.

Hogs from the age of twelve to eighteen months are the most advantageously fed for fattening, as they have then attained their full growth, will require less food, and fatten much more expeditiously than hogs which are younger.

Food which has been rendered acid by fermentation has been frequently recommended in preference to that which is sweet for feeding swine, and we have been told by farmers who have practised the method that it is very beneficial. In order to effect the desirable degree of fermentation the following process may be adopted.

Steam or boil potatoes, mash them, and mix with the liquor, while scalding hot, oats, Indian meal, pea meal, or the meal of any other kind of grain. Have ready several tubs or other vessels to receive this wash, and when it is fermented to the proper degree give it to the animals. It should not stand till it has become very sour; and if the putrid fermentation has commenced it is nearly ruined.

The following mode of procuring acidulated food for swine is pointed out by the celebrated Arthur Young. "Grind the grain to meal, and mix it with water in cisterns made for that purpose, in the proportion of five bushels of meal in a hundred gallons of water; the mass to be well stirred several times each day, till it has fermented and become slightly acid, when it will be ready for use. In this way two or three cisterns must be kept for fermentation in succession; and the profit will more than pay the expense."

ITEMS OF INTELLIGENCE.

The Harvest.—The New York Journal of Commerce says: "A gentleman who has returned from a tour through the western part of this State and Ohio, represents the crops as most abundant, and says that absolutely one canal is not sufficient to convey the overplus to market."

In Maine a very heavy crop of hay has been generally secured in excellent order; wheat and oats are un-

commonly good; potatoes very fine, and no doubt plenty of them. Indian corn is not ripe, and may be cut off in a great measure by frost. We understand there was a little frost in some places last week.—*Kennebec Journal*.

Dr. Elisha Bartlett of Lowell, has been appointed to deliver the Address at the annual exhibition at Concord, Middlesex County, in October next.

The annual meeting of the Strafford N. H. Agricultural Society and Cattle Show, will be holden at the Iron Works Corner, so called, in the town of Gilmanton in said County, on the 2d and 3d days of October next, commencing at 10 o'clock, A. M. on each of said days. On the first day will be the exhibition of stock and domestic articles, at 12 o'clock noon—2d day ploughing match and Address.

Wheat. Seldom have we had such a bountiful crop of wheat from the amount sown, as has been harvested this season. The only thing to regret is, that more had not been sown in the Spring, for the crop of Indian corn will be very light, and there will probably be a greater demand for wheat than can be supplied from our own harvest.—*Maine Farmer*.

The Fifth Annual Exhibition of the *Pennsylvania Horticultural Society* was to be holden at Philadelphia this day and tomorrow, the 11th and 12th inst.

Mr. Audubon, the celebrated naturalist, has recently returned from his Northeastern excursion to Labrador, &c. A narrative of his adventures, discoveries, and scientific acquisitions, has been published in the *Boston Daily Advertiser*.

PETRIFACTIONS. Petrified ears of corn impregnated with silver, copper and other metals, have been found on heights where they do not grow. The trunk of a petrified tree has been found upon Mount Stella, in the country of the Grisons, at 4000 feet above the height where the shrubs grow. In Spain, near the tower of Munda, at an elevation of 1500 feet above the sea, there exists entire beds of petrified wood. The impressions of plants found in Europe generally are those belonging to tropical climates of India and America. The strata in the environs of Paris have furnished sixty genera of fossil animals. At Rotewick, in Sweden, 3000 feet above the sea, entire beds of fossil shells are found; also upon the summit of Mount Perdu 10,578 feet high, and the tops of the Andes 13,200 feet high, are covered with petrified oyster shells. Such are some of the facts showing that our globe has undergone great revolutions."

BOSTON FANEUIL MARKET, Sept. 11, 1833.

Vegetables. Potatoes, 50 cts per bushel; Squashes, 2 cts. per lb.; White Portugal Onions, \$1 per bushel; Carrots, 75 cts pr bus.; Beets, 75 cts pr bus.; Cucumbers, 6 to 8 cts pr doz; Turnips, 6 cts pr bunch; large Lima Beans, 25 cts pr qt; Saba, or small Lima Beans, 20 cts. per qt.; Green Corn, 12½ cts pr doz; Tomatoes, \$1 per bus.; Pickles, 25 cts. per hundred.

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug 28

CLOVER SEED.

4000 lbs. Northern Clover Seed.—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

GRASS SEEDS.

(for fall sowing.)

FOR sale at the New England Seed Store, 51 and 52 North Market Street.

Clover, (Northern)—Herds Grass—Red Top—White Clover (fine imported)—Lucerne, &c. &c.—Wholesale and Retail.

VALUABLE FARM AT AUCTION OR PRIVATE SALE.

THE Subscriber offers for sale a Farm situated in the town of Marlboro', Mass. about half way between Howes' Tavern and the Lower Meeting-House. It consists of 140 acres of excellent land, with a large two-story Dwelling House, two Barns, Chaise and other Out-houses, with two fine Wells of Water. About 70 acres of the land is covered with a fine growth of the best quality of Wood; the remainder, consisting of Mowing Lands, Tillage and Orchard, is in a high state of cultivation. It now supports 20 head of horned cattle, horses, swine, &c.

For the last 25 years, this estate has been improved by Mr. William Wilson, deceased, and for 50 years previous thereto, it was known as "Munroe's Tavern." The excellent quality of its soil, the large and valuable quantity of wood, and its other numerous advantages, make it a most desirable situation for a farmer; while its situation (on the old road to Worcester, on which the travel is great, the distance from any other tavern and its former notoriety as one), makes it a no less desirable situation for a Tavern again.

The above estate, free from all incumbrances whatever, will be sold on Friday the first day of November, unless previously disposed of by private sale. As also, at the same time, all the cattle, a large quantity of hay and grain, farming utensils, &c. as are not previously disposed of.

Terms of purchase made known on the day of sale. Likewise, several other lots of land belonging to the same estate, will be sold at the same time.

JOSIAH WILSON, Administrator.

For further information, apply to WEBBER WILSON, on the premises, or to Messrs. LOT WHEELWRIGHT & SON, No. 46 Central Wharf. sep 11

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sep 11 eow6w

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Coehles, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. optf

PATENT GRATER CIDER MILL.

DANIEL LELAND having purchased the patent of the above named Mills, would call the attention of Farmers and others in this vicinity, to the undersigned certificates of their merits, and feels confident that they are superior to any other in use, for grinding apples.

These Mills are drawn by one horse. Six, eight, ten, and twelve feet wheels are used, some with one and some two drums. They may be placed in a building, and so fixed as to grind upon the press, or into a trough. The following certificates will probably give the public some proof of their value.

"This may certify that we the subscribers have made use of Joel Farnum's Patent Grater Cider Mill, for three years past. We grind a cheese of cider in one quarter of the time we did in the old mill; it grinds better, makes more and better cider; we grind upon the press, and save the shoveling of the pumice, and the juice may be extracted in less time.

JOHN CLARK, 2d.

Medway, August 8, 1833.

JAMES P. CLARK.

"This may certify that we the subscribers, have used the above named machine for three years last past, and approve of the plan of grinding apples. We save one third part of labour and time in grinding and laying up a cheese of cider. It grinds better than the old mills generally do, the cider is clearer and contains less sediment; the cider is pressed out in less time, and the mills are kept in repair at less expense than the old mills.

Sherburne, Aug. 9, 1833.

AARON LELAND.

JOSEPH P. LELAND.

"This may certify, that I have assisted in the making of cider in the above named mills, and consider it a valuable improvement in the making of cider. At one time we ground and laid up, apples sufficient for eight barrels of cider, in forty minutes, by the watch. We save one half of the time, in grinding and laying up the cheese.

Sherburne, Aug. 9, 1833.

JOTHAM W. ROGERS.

For further particulars apply to J. R. NEWELL, Agricultural Warehouse, where Mills, are on hand, or will be furnished at short notice, or to DANIEL LELAND, Sherburne.

Sherburne, Aug. 1833.

BRIGHTON MARKET.—MONDAY, SEPT. 9, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 780 Beef Cattle, 140 Stores, 3130 Sheep, and 290 Swine. About 75 Beef Cattle remain unsold, most of which are ordinary.

PRICES. *Beef Cattle.*—Last week's prices were not supported; a very few only brought the highest prices. We quote prime at \$5 a 5 75; good at 4 50 a 5; thin at 3 a 4 25.

Cows and Calves. We noticed sales at \$19, 20, 24, 28, and one, very fine, at \$45.

Sheep.—Sales quick; lots were taken at \$1 37, 1 50, 1 67, 1 71, 1 88, 2 00, 2 25, and 2 33.

Swine.—Several lots were taken at about 5 c. for Sows and Barrows selected; at retail 5c. for Sows and 6c. for Barrows.

TO SUBSCRIBERS.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half-bound and lettered, at 75 cents per volume, by leaving them at the Farmer Office. July 17

MISCELLANY.

For the New England Farmer.

TO — — —.

Oh, say not so—I would not take
A crown, if that must be
A reason why my heart should break
The vows it made to thee.

While virtue, with intent benign,
Makes human weal her care,
And in thy bosom finds a shrine,
My heart shall worship there.

Nor time, nor circumstance, nor aught
Of fate's unkind decree,
Shall bring "oblivion of a thought"—
One kindly thought of thee.

Oh! say not so—this world would be,
A waste—if that were true,
A wilderness—at least to me;
Not so, perhaps—to you;

For thousand sources of delight,
And other flowers as sweet,
Ope to your yet unwearied sight,
And spring beneath your feet.

Oh, say not so—not always dies
The stem, when fade the flowers.—
A brighter spring and sunnier skies,
Where never cloud was known to rise,
Shall wake to life this bud of ours.

The following elegant Impromptu was laid on the table of the Mass. Hor. Society, at a recent exhibition of Fruits Flowers, &c. We understand that it was written by Mr.—Williams of Cambridge, who, though an aged, is it seems not an unsuccessful suitor of the Muse.

WHEN Ceres with Pomona join
Their bounty with the cluster'd vine,
The velvet Peach and melting Pear
Contributes each a liberal share;
And all the minor fruits present
Their most delicious complement,
It may be ask'd, with such a store,
Can Epicureans wish for more?

THE JEW JEW'D.

It was observed that a certain covetous rich man never invited any person to dine with him. 'I will lay a wager,' said a wag, 'that I get an invitation from him.' The wager being accepted, he goes the next day to the rich man's house about the time he was known to sit down to dinner, and tells the servant that he must speak with his master immediately, for that he could save him a thousand pounds. 'Sir,' says the servant to his master, 'here is a man in a great hurry to speak with you, who says he can save you a thousand pounds.' Out comes the master, 'what is that you say sir, that you can save me a thousand pounds?' 'Yes sir, I can, but I see you are at dinner; I will go myself and dine, and call again.' 'O pray, sir, take dinner with me.' 'Sir, I shall be troublesome.' 'Not at all. Not at all.' The invitation was accepted. As soon as dinner was over, and the family retired, 'well sir,' says the man of the house, 'now to our business. Pray let me know how I am to save his thousand pounds?' 'Why sir,' said the other, 'I hear you have a daughter to dispose of in marriage.' 'I have.' 'And you intend to portion her with ten thousand pounds.' 'I do so.' 'Then sir, let me have her with nine thousand.' The master of the house rose in a passion and turned him out of doors.

It was a fine sentence of Cobbett, a pearl among pebbles, in which he asserts that he has never suffered any thing, although often disgraced in the eyes of the world, condemned by the tribunals of his country, fined by his king, imprisoned by his courts, and every way degraded in his relations with society—because he had felt no trouble at home, and in his family—because his wife loved, and assiduously cherished and comforted him, his children revered, his domestics respected and served him faithfully.—*Salem Gaz.*

Paternal Solicitude. A young man, to whom Corneille was to give his daughter in marriage, being unable, from the state of his affairs, to carry the match into effect, came one morning to her father's house to inform him of it. He penetrated as far as the poet's study, for the purpose of explaining the motives of his conduct. "Well sir," replied Corneille, "could you not have communicated all this to my wife without interrupting me? Ascend into her chamber, for I understand nothing about such affairs."

Lord Byron. It may not be generally known that the present Lord Chancellor Brougham is the real author of the famous article in the Edinburgh Review, on Byron's Juvenile production, "Hours of Idleness," for which Jeffrey was so severely taken to task in the satire, "English Bards and Scotch Reviewers." We have this fact from an authority on which we can place the utmost reliance.—*Edinburgh Observer.*

A Deacon corrected by a Drunkard. We have noticed in some of our exchange papers, an anecdote of which the following is the substance. Names are omitted, because we have not the copy at hand. An old toper who was sensible of the ill consequences to himself and others of too great facilities for obtaining rum, held out by those whose example ought to be good, called one evening on a rum merchant, Dea. B——, to get his bottle replenished. After the Deacon had drawn the liquor, and while he was pocketing the pay,—"Deacon,—(said the toper,) what do you suppose I saw in imagination while you were drawing the rum?"—"I don't know (said the other,) what was it?"—"Why, (said the toper,) I thought I saw the devil leaning over you, and as he grinned a ghastly smile, exclaimed, 'That's the Deacon for me!'"

The following is said to be the origin of nine tailors making a man:—A beggar stopped at a shop where nine tailors were at work, and craved charity of them; each contributed his mite, and presented the beggar with the sum total. The beggar, thanking them for their kindness, said they had made a man of him.

How often have I told you, that fools do more mischief in the world than villains. A villain is generally possessed of sense, and does not deal in defamation, unless he can thereby attain some end. But a fool is continually prating—I merely go out of a rascal's road, but I conceal myself from a blockhead.—*Kotzebue's Happy-Family.*

POPULAR FALLACIES.

THERE is a wonderful vigor in a popular fallacy. When the world has once got hold of a lie, it is astonishing how hard it is to get it out of the world. You beat it about the head till it seems

to have given up the ghost; and lo! the next day it is as healthy as ever again. The best example of the vitality of a fine saying which has the advantage of being a fallacy, is in the overhackneyed piece of nonsense attributed to Archimedes, viz: "that he could move the earth, if he had any place at a distance from it to fix a prop for his lever." Your excellency knows that this is one of the standard allusions, one of the necessary stock in trade, for all orators, poets and newspaper writers; and persons, whenever they meet with it, take Archimedes for an extraordinary great man, and cry, "Lord, how wonderful!" Now, if Archimedes had found his place, his prop and his lever, and if he could have moved with the swiftness of a cannon ball, 480 miles every hour, it would have taken him just 44,963,540,000,000 years to have raised the earth one inch! And yet people will go on quoting absurdity as gospel—wondering at the wisdom of Archimedes.—*England and the English.*

RUSSIA DIAPERS, at \$3 a Piece.

COMMUNICATIONS.

For the New England Farmer.

CULTURE OF WHEAT.....No. V.

WE have assumed the position that the soil of New England is not unfavorable to the growth of wheat; and though, as in other places, it is exposed to various accidents and diseases, yet there is no substantial ground for being discouraged in its cultivation. There is nothing in the soil or climate, as yet ascertained, that forbids its growth. We do not pretend that the old and worn out soils of New England are to be compared to the virgin soils of newly cleared countries, or to the rich alluvions of the western states. We do not pretend that our soil is peculiarly favorable to its growth; or that it can be raised at as little expense as in many parts of the country; though much of the land in Maine, we know from personal observation, is eminently propitious to its culture; but we believe that on most of our farms, some portion of land may be devoted to this cultivation with success and advantage; and as good flour has been made from wheat grown in New England as was ever produced in any part of the country. Rye is doubtless a more sure crop; Indian corn a much more sure, and under good cultivation, not a less valuable crop; but wheat should have a place in our husbandry; and every farmer who is not very unfavorably situated, should attempt to produce enough at least for his own consumption. The crops in Massachusetts, from facts already adduced, it is apparent, have averaged more than twenty bushels to the acre; and some have risen as high as fifty. Now the average crop throughout the world as stated by Armstrong, is not higher than seven or eight bushels. There seems then to be the strongest motives to make this valuable cultivation matter of particular inquiry, observation, and experiment, that it may be carried to that degree of improvement of which it is susceptible.

I have already extended my communications much beyond what I at first designed; and there remains now but one topic upon which I shall offer any farther remarks; that is, the selection of seed for sowing.

The earliest kind of wheat is to be chosen, and in this matter there is a great difference. The red chaffed wheat and the bearded, has been, from the best observation made, less liable to blast than the white flint and the thick chaffed varieties; and it is important in the next place to choose the fairest and healthiest seed. It is an opinion prevalent in many parts of the country, that blighted wheat is equally good for seed as the fair and perfect grain. Indeed, I have been informed that some farmers have actually changed their sound and full seed for that which was blighted, as the latter was cheaper, and from the greater number of grains to a bushel would go farther. This practice has been sanctioned and encouraged by as high an authority as that of Sir Joseph Banks; but both reason and experiment loudly condemn the practice. Who expects to get as good a product from small and half ripened potatoes as from those which are fair and fully grown? and so in respect to other seeds? Who would take his most diminutive, half grown, stunted, and deformed animals, for the

purpose of raising from them an improved stock; and who does not know that by such a choice the race must inevitably become deteriorated? Why does not the analogy apply equally to wheat? The matter, however, has been put beyond a question by a most valuable experiment on record.

"The late Benjamin Bell, Esq. in October 1783, sowed a field of twelve acres at Hunettrill, Roxburghshire, with 54 bushels of wheat, of which 12 bushels were the best that could be procured in the London market of crop 1783, 30 bushels were from East Lothian of crop 1783, 6 bushels the best wheat in the London market of crop 1782, and 6 bushels produced near Edinburgh in the year 1782. It must be remembered that 1782 was a season generally unfavorable to raising wheat in perfection; but that in 1783 the grain was sound and of good quality. The field on which these parcels of wheat were sown had been well fallowed, was equally manured with dung, and the whole of these seeds were sown in the beginning of October, all of them having been washed in strong brine, and afterwards dried with powdered quicklime. The English seed of crop 1783 was sown on one side of the field; three bushels of the Mid-Lothian seed of crop 1782 were sown in the next three ridges; to this succeeded the English seed crop of 1782; then the East Lothian wheat of crop 1783; and lastly, the remaining three bushels of Mid-Lothian seed crop 1782.

"The field being all in good condition, the wheat appeared early above ground; and the shoots were every where strong except on those ridges which were sown with the Mid-Lothian seed crop of 1782, on which the plants were weak and not very numerous; neither did they spread or tiller like the others; so that during the winter and spring months, the wheat on these ridges had a weak appearance; on harvesting, the straw was thin and short; and the ears were short and small, the grain likewise being not so large nor heavy as on the other parts of the field. On being threshed and measured, the produce of the 12 bushels of seed, crop 1782, both the London and Mid-Lothian taken together, was only 66 bushels, or $5\frac{1}{2}$ after one. The produce of the rest of the field was fully 15 bushels for every bushel of seed. The difference in value was also considerable, as the produce of the seed from 1782 sold almost a shilling the bushel lower than the other. On the whole, it seems the safest plan, to use none but good seed, and to avoid as much as possible the seed of wheat that has been infected with any disorder."*

H. C.

Meadowbanks, Deerfield, 26th Aug. 1833.

For the New England Farmer.

DROUGHT.

Extract from a Letter from Mr. J. Adlum to the Proprietor of the New England Farmer, dated—

"Vineyard near Georgetown, D. C. Sept. 6, 1833.

"My grapes in the Vineyard, this year, are nearly a total failure, and my neighbors' vineyards, with but one exception, have also suffered much by the grape cracking and drying up.

"We have had one of the greatest droughts this

year known by the oldest inhabitants. Our Indian corn crops are very short, and our pastures and all vegetation drying up. But it now appears as if we should have rain soon, as it is clouding over pretty generally."

For the New England Farmer.

FRUIT TREES.

THE following observations are prefatory to an abridged Descriptive Catalogue of the Fruit Trees in the Collection of J. B. Van Mons, a celebrated Cultivator of Fruit Trees in Belgium, Europe. We were favored with the manuscript by R. MANNING, Esq. of Salem, Mass. for whom it was translated from the French by Miss ELIZABETH C. HATHORNE, of that place. We think the remarks cannot but prove useful to all persons engaged in the raising of Fruits, and especially to those who wish to create or introduce new and improved varieties of Apples, Pears, &c.—

TRANSLATION.

Being unwilling to leave my correspondents in ignorance of the fruits which I have sent them, designated by numbers alone, I have caused the materials for this catalogue to be collected during a severe illness. There may be omissions in it, but there are no errors; and the repetitions refer to the parent stocks, and to their grafts, but are not unnecessarily employed.

In so vast an establishment, containing not less than 86,000 trees, it was impossible to inscribe at length on tickets the names of all the fruits of which we distributed grafts; and we found it at once more simple and more expeditious to mark on a slip of paper the No. attached to the tree, and to point out afterwards the variety to which the No. belonged.

We attached a No. in lead, suspended by a wire of the same metal, to every tree and graft in the garden, as well as to every Sauvageon (ungrafted tree, raised from seed,) from which we gathered fruit, and we noted in catalogues the names or the qualities of the fruits to which these Nos. referred. We have thought it expedient to have those Catalogues printed.

There are in the first series many Nos. to which no descriptions are annexed, because they are occupied by old varieties generally known. The vacant Nos. in the second and third series belong to new varieties which have not answered the expectations formed respecting them. Some vacancies are also left by duplicates and triplicates of the same variety, which we had received under the same names.

We have, as far as possible, given the names of the Authors of the Fruits. By its Patrons, signifies that it was found by the Cultivator whose name it bears. By ourselves, that it is the result of our endeavors. The articles designated by Nos. alone, are necessarily products of our culture.

I have added in my Catalogues the approximate forms of my new fruits, though nothing can be more uncertain than this characteristic, for the form of a pear varies during 12 or 15 years before it is definitively fixed; and there are some which never attain a fixed form, as the Bon Chretien d'hiver, the Beurre Rance, &c. I have compared them to known varieties. I might here compare

* Sinclair's General Report, Vol. I, p. 479.

them to the wild fruits of the same species (*sous especes des bois*), but in countries where the kind does not grow spontaneously, there would have been no point of comparison.

We admit into this Catalogue only the species which we have been able to send to our correspondents, under the form of Grafts, such as the Pear, Apple, Plum and Cherry Tree. We have, however, discovered a method of conveying under the same form the Peach and the Apricot Tree. It consists in grafting them on the summit, or on the bourgeons (bud's eyes) of the Plum Tree, and sending the grafted branch before or after the development of the eye, to be grafted *en fente* (or cleft or slit-grafting) on another Plum Tree. We have never yet found this method to fail.

There are many numbers which have not yet received names, because we thought it right to name only the varieties, which in our judgment merited the title of *tres a propager* (eminently worthy to be propagated), which expressed the highest excellence that a fruit can attain, and requires it to be superior to a St. Germain, a Beurre Gris, a Chaumontelle, a Colmar, a Cressane, &c. Respect to the persons to whom we offer the homage of our fortunate acquisitions by bestowing their names upon the fruits, exacts from us this extreme reserve.

This distinction between Fruits *a propager* (to be propagated) and those *tres a propager*, is solely for ourselves, who are so rich in this last quality of fruits, which unites elegance of form, and amplitude of size, to the utmost delicacy of flesh and of juice, while we are so poor in subjects for grafting. The words Excellent, Exquisite, Delicious, annexed to a great number of our new fruits, are equivalent to the declaration that they are as good as the best old varieties.

In another position than that in which we are placed, we might enlarge on the origin, the form, the qualities, I will say the defects, the epoch of maturity, and other particulars of the Fruits bearing names. In the next supplement, if it be ever published, we may, perhaps, revert to these details; but at present I can only cause to be transcribed the judgments pronounced upon each variety, and consigned to my notes.

It may be asked, how we have been able to obtain from our seed-plots so many Fruits, so extraordinary in all respects? We answer that our method has been to renew incessantly the old varieties, acknowledged as exquisite. By renewing we mean planting always the kernels and stones of the last produced, regenerating thus from father to son. We said to ourselves once for all, that the more a species, being propagated from seed, and at the same time by shoots or suckers, is removed by being repeatedly sown, from a state of nature, the more it must approach a state of art. We have since acted in conformity to this principle, and already at the third renewing, the fruit of the Peach and Apricot tree is no longer of ordinary merit, and, at its fourth sowing the apple is reproduced constantly exquisite. This has not been the case with the Pear tree, which still produces ordinary fruit, though no longer bad. But for this characteristic of the Pear, and especially that of the incessant variation of its form, pomological researches would be already without an object, and the study of fruits would consist only in a dry acquisition of names.

Our seed plots were differently treated according to the species. The Pear Trees were planted

in squares, and the Apple Trees were placed in one of the corners of the garden: these species were never planted together. The Peach and Apricot Trees, sown confusedly, were removed only to be placed where they were to remain. The growth of all was restrained by pruning till the moment of permanently placing them; and at transplantation the branches were slightly drawn together, and the roots forcibly so, in order to make the latter subdivide, which causes the tree to bear early. After the transplantation they were not touched. In the second year we examined the Pear Trees, leaving only those of good appearance, and choosing the others to graft upon. This grafting could not be performed without removal, because the growth of the sauvageons would immeasurably outstrip that of the grafted trees. We therefore raised the trees, just before the frosts, and placed them *en jauge* [in casks or barrels], in order to graft upon them by copulation, and out of the earth at the end of February; or we grafted them in this manner before the beginning of winter. These grafts have endured with perfect safety the severity of the past winter. This method is preferable to every other for the Pear tree and the Apple tree. The suffering, which in this case is common to the tree and the graft, secures its taking and determines an equal force of development. It might be called the *graft on one's knee*, or *the graft at the corner of the fire*. It is the only one which should be practised, except *en fente* (slit cleft) for the Paradise and the Quince tree, of which every piece of a trunk, branch or root only, 2 or 3 inches long and 2 or 3 lines thick, may be made useful as a subject.

This selection of subjects for grafting does not prevent our trees from being so near each other as to shoot into the air, like arrows, and to resemble Italian poplars rather than ordinary pear trees: they were not forced by the knife to take a direction contrary to nature; and these trees, so high, so straight, with branches so regular, and unapproached by any insect, were every year covered with fruit from the summit to the foot. The great art in giving to a tree *au vent* (not trained in any particular shape) a regular form in maintaining the equilibrium between its branches, is to make it take from its birth a right direction by attaching it to a proper support.

The new fruits have over the old the advantage of yielding a rich and constant crop, and of exemption from falling off and from alteration. They are less liable to any malady.

When a Peach tree is raised from the stone and *au vent*, it is as unnecessary to despoil it of its branches as to thin it of fruit; in the third year, it puts forth only short branches, which bear without intermission, and whatever be the number of the fruits, the smallest is not less savory than the largest; the flesh of the peaches of seed plots remaining long transparent and greenish. This is also the case with the Nectarine, whose fruit *au vent* may be preserved from insects.

I was at first in the habit of placing a graft of the most distinguished of my sauvageons on a lateral branch of a mature tree; but I have always observed that this branch and the parent-stock began to bear the same year, so that while the trees were mutilated nothing was gained in precocity of crop.

It will be perceived that in our last catalogues, the number of fruits inscribed *excellent* is much more considerable than in the first: this proceeds

in part, it is true, from our more extended cultivation, but also from the circumstance that in proportion as we advance in renewing the varieties, the number of distinguished fruits is multiplied.

We also remark, that the more the fruits are renewed, the fewer early varieties do we obtain; for example, in the last year few of our apples and pears of the first crop ripened before winter; and even at this moment (March), I have a great number which are not ripe, and which ripen successively as they advance in merit. It is true that in the selection of Sauvageons, we remove all the pear trees that are without thorns and with stout branches and large leaves, as these are signs of precocity, and all the apple trees whose appearance resembles too much that of the early varieties.

It will be observed, that we have principally directed our endeavors to the improvement of pears. This was natural, because the pear has not hitherto been reproduced identically, but under astonishing deviations, which have hardly permitted comparisons. We have, in our thousands of results, obtained forms which resembled each other as to the fruits, but the appearance of the tree, the wood, the foliage, were entirely different; and when two trees had some resemblance in appearance, wood and foliage, the fruit was totally distinct. The following was my mode of passing judgment upon the varieties. I invited to dinner a friend, whose taste in fruit was exquisite, and we tasted together; then I made my two gardeners taste; we discussed for a moment the merit of the fruit, and I consigned the judgments to my notes, with the very expressions which are found in the Catalogue. As fruit whose period of maturity is not yet known must be gathered at different times, and at intervals of ten days, we had never less than 200 sorts to taste. The No. attached to the tree was transcribed upon each fruit. Every variety judged very good, and of the highest quality, was afterwards gathered and distributed to connoisseurs, on condition of returning the stones and the kernels: we have never sent a good new fruit to the market; we chose to allow it to rot in order to preserve the seed, rather than to sell it at a high price.

I was obliged to quit Brussels when almost all my Sauvageons of the 4th and 5th renewing were about to bear: an object of public utility claimed the ground which my establishment occupied: I shall, perhaps, be compelled to leave my new gardens when nearly all my Sauvageons of the 6th and 7th renewing are covered with flower-buds. I see that the more the renewings are multiplied, the earlier the Sauvageons begin to bear: a great many of my pear trees of 3 and 4 years old will produce this year.

In the inevitable disorder attendant on the destruction of an immense cultivation, effected during the severity of winter, it was impossible not to lose some varieties, though we took grafts of all the most precious, and though of these grafts, placed double and in April and May on trees out of the earth and half dry, very few perished. To gather grafts and to abandon the trees was all that we could do at such a moment, and when we could ourselves be present only for a day and a half in the week. We are consequently obliged to request our correspondents to return us grafts of those lost varieties, which are in their possession.

MASS. HORTICULTURAL SOCIETY.

REPORT OF H. A. S. DEARBORN.

Proceedings of the Massachusetts Horticultural Society, at a Meeting held in the Hall of the Institution on the 14th day of September, 1833—The following report was made by H. A. S. Dearborn, the President.

No subject in vegetable physiology, has claimed greater attention, among horticulturists, than the inquiry, "whether the stock has an influence on the graft;" and it will be recollected, that a very interesting communication was received, last year, from Doct. Mease of Philadelphia, in which the affirmative was maintained. With a most laudable zeal to illustrate and confirm the theory he had assumed, and to render an important service to the cultivators of fruits, his scientific labors have been continued, and I have recently received the following letter, containing the results of his researches.

INFLUENCE OF THE STOCK ON THE GRAFT.

Philadelphia, Aug. 17, 1833.

Gentlemen, Although the subject of the influence of the stock on the graft, would seem to be settled, by the paper I formerly sent you, yet I have deemed it proper to add a few more facts in favor of the opinion I advanced, or rather supported,—from Loudon's Gardener's Magazine, vol. 8, p. 492.

Signor Luigi Manetti states, "that the lemon grafted on the bitter orange resists the cold better than in its natural state; like the medlar of Japan, (*Eriobotrya japonica*, Lindley,) which when grafted on the white thorn (*Cratogeomys oxycantha*, L.) acquires additional strength, and the true Pistachio (*Pistacia vera*) which when grafted on the Turpentine tree (*Pistacia Terebintha*, L.) resists the cold of 8 deg. Reaumur, below 0, (14 deg. of Fahrenheit,) while if grown from the root, it dies at 5 deg. (20 and 3-4ths of F.) See Sageret *Pemologia Physiologie*, p. 16. The constitution (so to speak) of the lemons being strengthened in this manner, the tree may be left standing in the open air, even in the depth of winter. The cultivators of Nerva, and of Monaco in the Geoness territory, understand this method of cultivating the lemon." A gentleman attached to the Russian legation, informed me at Washington in the year 1828, that he has resided several years at Madrid, and was surprised to find several orange trees left out all winter, in the garden of one of the European ministers at that court, without injury. It is probable that they owe their preservation to the process above mentioned.

JAMES MEASE.

The Horticultural Society of Massachusetts.

The following letter and the seeds therein named have been received, from the Hon. STEPHEN C. PHILLIPS.

Salem, August 21, 1833.

My dear Sir, You may recollect your interview with my brother-in-law Mr. J. W. Peele, at New York, in December 1831, when he was on the point of embarking for Manilla, and that you then requested him to furnish you with such specimens of the agricultural productions of the Philippine Islands as he could readily procure, for the use of the Massachusetts Horticultural Society. I received from him, some time since, two packages of Cotton and Tobacco seed, which I now send

with this letter. They will probably be esteemed curiosities, and may prove valuable.

Very sincerely your friend,

STEPHEN C. PHILLIPS.

Hon. H. A. S. Dearborn.

As our climate is not favorable to the cultivation of these seeds, it is desirable they should be placed in the hands of the planters in the southern states, to whom they may prove important acquisitions; and as there are Horticultural Societies at Baltimore in Maryland, and at Charleston, South Carolina, it is recommended that the Tobacco seed be sent to the former and the Cotton seed to the latter. Respectfully submitted, by

H. A. S. DEARBORN, Pres. Mass. Hor. Soc.

Brinley Place, Roxbury, Sept. 14, 1833.

RESOLVED, That the thanks of the Society be presented to J. W. PEELE, Esq. for the valuable seeds which he has sent from Manilla.

Dr. John H. Richards of Paris, was elected a corresponding member; and the following gentlemen as subscription members—Dr. John Williams, Cambridgeport; Robert Wilson and John H. Eastburn, Boston.

EXHIBITION OF FLOWERS AT THE MASS HORT. SOC. ROOMS.

Saturday, Sept. 14, 1833.

S. Walker, Roxbury, Dahlias—*Gloria florum* superbum, Wells' royal Lilac, *Imperiosa*, Foster's incomparable, *Dennisi*, *Coccinia speciosissima*, *Romulus*, Squibb's pure yellow, Barrall's Susanna, Brilliant yellow, Colvill's perfecta, Hall's Mogul, Albina, Walker's Mary Louisa, together with a variety of flowers.

J. A. Kenrick, Newton, Dahlias, &c.

Thomas Mason, Charlestown Vineyard, fourteen varieties of Dahlias, and other flowers.

Messrs. Winship, assortment of flowers.

Also were presented by Mr. Winship, for exhibition only, some superior specimens of Dahlias and *Callistema anemone flore plena*, cultivated by Mr. Wm. Leathe, Cambridgeport, in his usual excellent manner.

By order of the Committee,

JONA. WINSHIP, Chairman.

EXHIBITION OF FRUITS.

Apples. By Dr. Noyes of Newburyport, 2 sorts of Seedling Apples, over ripe. By A. D. Williams, Sops of Vine, beautiful and good. By I. A. Kenrick, Governor apple and White pumpkin Sweet. By Charles Ellis, Newton, Pumpkin Sweet.

Pears. By John Heard, Jr. Esq. Johonnot Pears, a fine table fruit. Andrews Amory of Gibson, Autumn Catherine, a name unknown to the Committee. By B. V. French, Esq. a basket of new Pears raised from seed in Rhode Island called the Wilbur pear, good and worthy of cultivation. By Mr. Billings of Roxbury, the Chelmsford Tyngsborough or Mogul Summer, a foreign fruit which has received the above names, the true one being unknown; this pear is of very large size, very productive, but suitable only for baking. By Gen. Dearborn, Maria Louisa Pears, unripe. By R. Manning, the Ronville of the New Duhamel, prematurely ripe. By N. Davenport of Milton, a Native pear of large size; it may prove a good Baking sort, but not for the table. By Samuel Pond, Pears, name unknown. By S. Downer, Esq. Andrews, Capiamont, Knox, Fulton and Cushing; this last is a very superior fruit, and the Committee can give no higher praise than to borrow the

words of Van Mons, in describing his best fruits, "eminently worthy of cultivation."

Plums and Nectarines. By Samuel Pond, Coe's Golden Drop and Semiana. By John Heard, Jr. Esq. a variety of Plums, and one of Nectarines, unnamed. By Thomas Mason, Early Nectarine (*Brugnon Hatir*) Peaches. By Lieut. James Armstrong, U. S. navy, Seedling Peaches of large size, not at maturity. By Thomas Mason, English Swalch. By E. M. Richards, a good seedling variety. By Capt. Martin of Woburn, seedling Peaches, not at maturity. By E. Cowing, Lemon Freestone, and one variety, name unknown. By Miss E. Watson, Boston, a basket of beautiful seedling Peaches. By William Kenrick, Van Zant's Superb, a new variety from New York. By S. G. Perkins, Esq. two Peaches raised from the stone, called the "Pine Apple Clingstone."

Peaches and all stone Fruit, should ripen on the tree; if gathered before ripe, they never show the beautiful colors of the skin, or the high flavor of the flesh, which they otherwise would have done; the most delicious peaches are those which drop ripe from the tree; the Committee cannot judge of the correctness of the name, or the quantity of the fruit when sent in an immature state.

ROBERT MANNING.

PAWTUXET CATTLE SHOW & FAIR.

COMMITTEES.

THE Standing Committee of the Rhode Island Society for Encouragement of Domestic Industry, on the 11th of Sept. 1833, appointed the following Committees to officiate on the 24th and 25th insts.:

On Neat Stock, excepting Working Cattle—John Pitman, George Burton, Edmund Brownell, Lewis Dexter, Wilbur Kelley, Stephen T. Northam, Duttee Arnold.

On Sheep and Swine—Thomas Holden, Gorton Arnold, Samuel Low, Ira P. Evans, John Foster.

On Horses—Charles Eldridge, Truman Beck with, Stephen Harris, Bates Harris, Moses B. Ives, Thos. Buffum, Nathaniel Mowry.

On Working Cattle—Joel Aldrich, Thomas Stratford, Sterry Jenckes, Thos. Remington, [S. B.] Stephen Waterman, [Coventry], Caleb Congdon.

On Raw Silks and Mulberry Trees—Solomon Drown, Stephen H. Smith, Sylvester Knight, Wm. N. Rhodes, Amasa Manton.

On Agricultural Experiments, Vegetable Crops, Grain, &c.—Asa Messer, John Jenkes, Richard Anthony, Palemon Walcott, William E. Richmond, Christopher Knight.

On Shop Manufactures—James F. Simmons, John Farnum, Barney Merry, Samuel Pearson, John Allen, John Pettis, James Anthony.

On Ploughing Match—Jesse Tourtellott, Thos. W. Greene, Sion A. Rhodes, Smith Arnold, Jeremiah Whipple, Charles Collins, Isaac Field, William Lippitt.

On Butter and Cheese—William Anthony, Josiah Whitaker, Freeborn Sission, Matthew Watson, Geo. Smith, Christopher Spencer.

On Household Manufactures—Wm. E. Richmond, Joseph S. Cooke, Tully Dorrance, Joseph J. Tillinghast, Sylvanus G. Martin, C. S. Rhodes.

AUCTIONEERS.

For Premium Articles—Martin Stoddard.

For Stock—Nathaniel Mowry, 2d.

For REGULATIONS, &c.—see p. 79.

From the American Farmer.

ON THE USE OF LIME IN AGRICULTURE.

SIR—Agreeably to your request, I now communicate to you my experience in the use of lime in husbandry.

1st. While with my father in England, I assisted to set out large quantities of lime as a manure. It was applied to all soils upon his farm, viz: moss or turf, clay, black or yellow loam and sand loam. We put on from two to three hundred bushels the acre. I have seen land that before liming was so poor that it would bear nothing but bent and moss, after liming give the heaviest crops of oats and wheat for ten years, and I have no doubt it would have produced good crops for ten years longer, with suitable alteration of grasses.

2d. I have set out lime on my farm in this country, on stiff clay and on loams, in considerable quantities. It has been particularly beneficial on the clay. I had one field which would produce nothing of consequence until I lined it; after which I sowed it with rye and grass seeds. Both the grain and grass were good, and it is now covered with a fine rich sward. I have used lime for several years, and my confidence in its benefits have not at all been diminished.

3d. I am satisfied that lime is a preventive of smut in wheat, rye, oats and barley, if the seed, previous to sowing, is steeped in brine or lime water, and rolled in fresh-slacked lime. And I am equally satisfied it will destroy the insect, or Hessian fly, in the young grain, if sown in the morning when there is a heavy dew on the crop. Some years ago I sowed some spring wheat, and as I had no salt on my farm to make brine, I took stone lime, and slacked it in a tub of water; and when the water was as warm as I could bear my hand in, I put in the seed, skimmed off the light matters which floated, and continued stirring the grain for half an hour or more. The grain was then sown; and when it came into its third or fourth leaf, although it looked well, I sowed fresh-slacked lime over the field while the dew was upon it.—The crop was very good; while all my neighbors, except one, lost almost their entire crop of spring wheat. This one happened to be passing while I was sowing the lime on my young grain, and at my suggestion, went home and sowed it upon his own also, and I understand had a good crop.

4th. In the spring of 1823, I had about three acres of winter wheat, a portion of which looked very yellow when the snow went off. I directed this to be sown with lime; but on visiting my farm two weeks afterwards, I found it had not been done, and that the whole field assumed a like yellow appearance. I had the whole immediately sown with lime; the grain immediately improved in appearance, and I had a tolerable crop, though not so good, I think, as I should have had if the lime had been sown two weeks earlier.

Mr. Ebenezer Cady, of Duanesburgh, at my suggestion, adopted my method last spring, of steeping his seed, rolling it in lime, and sowing fresh-slacked lime upon his young grain. The experiment was so successful, that his wheat was considered the best in the country.

5th. I have applied lime successfully upon cucumbers, and other garden vines, to protect them from the yellow bug; taking care to repeat it as often as the wind or rain blew or washed off that which had been before applied. Half a bushel of

lime mixed with the earth of an ant hill, will effectually destroy a colony of these insects.

Your friend,

WILLIAM CHAPMAN.

From the Exeter News Letter.

Mr. Gerrish—Should you think the following is of any consequence to the farmers in Rockingham County, you will please give it an insertion.

TO FARMERS.

It has long been a practice of farmers to break up their ground and plant it for 2, 3, or 4 years before sowing it with wheat, believing that the ground must be very mellow before wheat would grow in any quantity to insure a crop.—I would inform them that I broke up an acre of hard clay and loam which was bound and killed out with barn, or, as some call it knot grass. On about $\frac{3}{4}$ of this acre I sowed one bushel of common Spring Wheat the 18th day of April—and on the 3d day of August I cut the same.—Having threshed it, I find I have 15 bushels of pure nice wheat—free from any smut or wild seeds.

Yours, NATH'L RUNDLET.

From the Temperance Recorder.

WATER OF LIME-STONE DISTRICTS.

THE following letter of Professor Stevens, of New York, will be read with interest by all who are exposed to the inconvenience he mentions. We are glad to have it in our power to give the opinion of one deservedly eminent in his profession, on a subject of such importance, especially as we know that the opinions of medical men, in cases of this kind, have great influence.

NEW YORK, 6th June, 1833.

DEAR SIR,—In an excursion, several years since, through the extensive range of limestone country, which forms a large portion of the northern and western parts of this state, I had to observe an almost universal recourse to brandy, as a corrective of the effects of limestone water.—Your philanthropic labors in the cause of temperance have undoubtedly produced a great change in the habits of travellers, as well as of others—still I apprehend that the belief in the propriety of taking brandy as a medicine to prevent or remove the effects of impure water, is too universal, and fraught with too many bad consequences not to deserve a special notice; and the subject acquires great importance, when we consider that disorder of the bowels affects a very large majority of all those who use, without being accustomed to it, impure, and particularly limestone water; and the occasional severity of this disorder, and the inconvenience to which, even in its mildest form, it subjects the traveller, are such as to lead him to seek a preventive or a remedy. Brandy is neither the one nor the other.

The habitual brandy drinker more rarely escapes a disorder of the bowels from the first use of impure water, than the temperate man. An increase of his usual potations seldom gives him immunity. As a means of cure after the disorder has begun, the use of ardent spirits often induces chronic affections of the viscera, usually an inflamed condition of the inner lining of the stomach, causing excessive burning, and inability to retain any thing that is swallowed.

The salts of lime held in solution are chiefly precipitated by boiling. In this city our tea-kettles soon become encrusted with a thick coat from the deposit of them, and by just so much is the water purer after having been boiled than it was before.

Boiling therefore being the grand corrective of hard water, it is much to be desired that the keepers of hotels in limestone districts should cause such water, instead of that which is, to be offered to their guests. Cold toast water made entirely with boiling water, could not fail to be acceptable to those who know its value. It is at once a preventive and a cure. Where this cannot be obtained, mint tea, prepared by adding a few drops of the essence, to hot water and sugar, which may be found at most bars, may be substituted, if before dinner. After the looseness has come on, it will be right to avoid watery fruits and vegetables. If it be slight, no other attentions will in general be required.

I am, &c.

ALEX. H. STEVENS.

This is no new invention, by some thousands of years. The Romans often boiled water for drinking, and then cooled it by setting the vessel containing it in snow, which they preserved as we do ice. The country about Rome is a "Limestone District."

PICKLES.

HAPPENING in at the house of a gentleman, a few months since, he remarked that he had adopted a new method of preserving cucumbers, or making pickles, and as proof of its excellence, produced some prepared according to his system.—As it was new to me, it may possibly be so to some of the readers of the Farmer. Take of common sour cider, such as cider drinkers usually denominate hard, a quantity sufficient to cover the cucumbers intended to pickle, and put it into a vessel proper for the purpose. Gather your cucumbers when of the right size, without scratching or bruising them—rub or wash them clean, and put them in the cider—stir them occasionally, and if a scum rises let it be taken off, and they will gradually become pickles of the first quality, green, hard, and of fine appearance. Peppers, and other condiments, may be added as required. I cannot vouch for the invariable success of this mode, but in the hands of my friend I know it operated admirably, and the expense and trouble are so small, compared with some other methods, that it is well worthy a trial.

W. G.

Otisco, 1833.

UNIVERSAL MILL.

In this mill, both the stones are made to revolve, but the upper one receives its motion from that of the lower, in a way to be presently described.—The lower stone is fixed firmly upon a vertical shaft, which is made to revolve by the application of any suitable power, and with any required speed. The upper stone is made smaller than the lower; say one fifth less in diameter, and it is placed so as not to be concentric with it; it may, for example, be so situated, that the peripheries of the two stones will coincide on one side, whilst on the opposite side one-fifth of the diameter of the lower stone will be exposed. The upper stone is kept in its place, and its pressure regulated by means of a screw passing through a beam above it, the point of which bears upon a bridge piece in the middle of the eye. It will be at once evident that the revolution of the lower stone will give a slower and peculiar revolution to the upper. A hopper is to rise above the eye of the upper stone, and other requisite appendages are employed. Metal may, in some cases, be employed instead of the stones for grinding.—*New Monthly.*

PURE WATER.

A WRITER who dates Cincinnati, has published in the Daily National Republican the following mode of procuring pure water, which he observed was the result of a series of experiments instituted at Paris a few years ago for the express purpose of ascertaining the best and most certain mode of procuring pure water.

"Into a wooden cask, set upright upon a stand, place two faucets, one near the bottom, the other about 6 inches. Fill the cask with water, and add powdered alum in the proportion of not less than half a drachm to the gallon, which is to be stirred into the water, and allowed 24 hours to settle. Should any acidity be perceived, an equal quantity of subcarbonate of soda [common soda of the shops] will neutralize it. For use, draw the water from the upper faucet; and always be careful to wash the barrel well before refilling it.

"If, as has been conjectured in Europe, the prevailing epidemic (Asiatic Cholera) is entirely telluric, and created by mephitic vapors communicated to the water (and the conjecture is certainly favored by the deranged condition of the digestive functions which most generally precedes the severe attack of cholera), you will see in this, a strong argument for the immediate and general adoption of the means here recommended for freeing the water used for drink at least, of the animal or vegetable poisons with which it may abound."

ITEMS OF ECONOMY, ARTS, &c.

Recipe for Croup. Dr. Godman has recommended the following as a certain as well as a simple remedy for a common and often fatal disease among children. He says, "whenever they are threatened with an attack of croup, I direct a plaster covered with dry Scotch snuff, varying in size according to the age of the patient, to be applied directly across the top of the thorax, and retained there till all the symptoms disappear. The remedy is found to be always effectual when applied in the first and second stages of the malady." The plaster is made by greasing a piece of linen, and covering it with snuff.

Prescription for a Cough. Take 2 table spoonful of molasses, 2 do. of vinegar, 2 tea spoonful antimonial wine, 40 drops of laudanum. Mix them together, and take six tea spoonful on going to bed; if a cure is not effected the first night, try it again the succeeding night.—*Southern Planter.*

Shade Trees. The *tilia*, known in Europe by the names of lime and linden, is much spoken of recently in the agricultural and other newspapers, as a superior ornamental tree. We were thinking of sending to Brighton for a few of these beautiful trees, when we found out by the Genesee Farmer that they were nothing more nor less than *basswood*. No doubt they make pretty trees when planted in open fields and gardens, for the leaves are large, round and thick, making in the forest where they fall a deep black vegetable mold.—*Ken. Jour.*

Horses and Cattle. An intelligent farmer of this town has communicated to us, what he says, is an effectual remedy against injury to horses and cattle, who may have eaten too much grain: It is simply to administer a pint of melted hog's lard as soon as the fact is discovered. He says he has tried the experiment a number of times, and always with success.—*Norridgewock Journal.*

 **The Newburyport Horticultural Society** will have an exhibition of fruits and flowers on Saturday next, at the rooms over store No. 6, State street, occupied by Mr. Jacob B. Morss. The rooms will be open for the reception of any articles which may be brought for exhibition, between the hours of 8 and 10 in the morning; and between the hours of 10 and 12 the doors will be opened for company. The ladies of Newburyport are invited to attend, and are particularly requested to send any flower either rare or beautiful. They will receive no injury, and at the close of the exhibition, be at the disposal of those who exhibit them. Gentlemen are requested to send specimens of fine fruit, of apples, pears, peaches, plums, grapes or melons, and indeed sending any thing excellent of their kind. At present, the exhibition is not confined to members of the Society, but ladies and gentlemen, who feel an interest in the Society, are requested to attend.—*Herald.*

Rye. The Haverhill Democratic Republican states, that Mr. Jacob Davis of Bradford, Vt. found the production of one kernel of rye in his field, to be 400 feet of straw, 75 heads and 3270 plump kernels.

Apple Peru. The Portsmouth Gazette states, two instances have lately happened of children having eaten the seeds of this plant, to one of whom the poison proved fatal.

Longevity. A Scotch paper notices an old woman living near Glosslough, who is 130 years of age. She never took a doctor's drug in all her life, nor was a lancet ever applied to her frame; she is perfectly free of affections of the chest, and during the last century of her life she had been a perfect stranger to pain, and her pulse does not exceed seventy. Her grandfather died at the age of 129, and her father died in the 120th year of his age.

Corn Soup. Cut the corn from the cob, and boil it in water until it is sufficiently done: then pour in new milk, with salt, pepper and one or two eggs; continue the boiling, and stir in flour in order to thicken it a little. This will be superior to the best turtle soup.—*Winchester Rep.*

Pruning the Vine. Well, neighbor, how does your Isabella promise this season? Not a single grape. Ah! how is that? We sent for Mr. M. last fall, and he pruned it so closely that the two branches looked like naked sticks, and now we shall not have a grape to gratify our palate.

Close pruning is too common in this country. In summer only the unproductive shoots should be taken out, and not these unless they produce too much shade.—*New York Farmer.*

New Invention. A gum elastic cloak, lined with silk, has been invented in Baltimore. It is intended to be thrown over the shoulders in wet weather, and will effectually shield the person and clothes of the wearer. When not wanted, it can be folded up into a very small bulk, and on this account must be found very useful and convenient. We mean to have one ordered on for our own use, so as to be ready for the next fall elections.—*Cin. Rep.*

Rule in planting Corn.—A correspondent was pleased the other day with the reply of a farmer to the question how many kernels he put in a hill:

One for the black-bird,
One for the crow,
One for the cut-worm,
And two to grow.

We have been presented with a singular ear of Corn, brought originally from the Rocky Mountains, and raised in a garden in this town. Each grain of corn is enclosed in a shock, so as to be capable of standing considerable severity of weather without injury. The grains are fine and large.—*Alexandria Gaz.*

Men of the Revolution. We last week saw in this town six brothers, the youngest over 60 years old. They had not been all together before since the Revolutionary war. Four of them were out in the American service in that war. Four of them live in this county, and are well known here; the others in Massachusetts. They are all worthy and respected, hale and vigorous, enjoying a 'green old age,' the fruit of a temperate life and a clear conscience. Their names are Craig,—Moses, Elias, Elijah, Jesse, Enoch, and David, and they have a sister in this town, widow of the late Lewis Hamlen, also over 60.

These men of the Revolution are an iron race, unlike the pale dyspeptics and chicken-fisted dandies of the present day.—*Ken. Jour.*

Patent Tinned Lead Pipes. An article under this name is mentioned in the London papers, which seems likely to supersede the use of all other metals which hitherto have been employed for conduits. To lead alone, in pipes, cisterns, &c. it is well known that the most serious objections exist. For instance, the action of air on lead produces oxide, which water dissolves, and thus water becomes poisonous. Similar deleterious effects are caused by leaden pipes in beer engines. It was to remedy these evils that the new process of tinning lead pipes was brought to perfection, and Messrs. J. & R. Warner, the patentees, affirm that the additional cost for the improved article is very trifling.

Best method of destroying Couch or Quitch-grass. I have a small piece of land where it grew in great abundance. Last season I ploughed it no deeper than the roots penetrate; let it lay about three days to dry; then harrowed it thoroughly; then with a fork and rake gathered the sods and piled them in the form of cones, where I let them remain till the commencement of the present season; when I found they had rotted completely, and no roots remained in the ground. At the usual time of ploughing this season I performed a like operation, and now find the grass so much decreased that I think another year will totally destroy it. I planted corn on the ground both years.

The grass will spring from the piles the first part of the season, but they should be made not more than three or four feet in diameter at the base, so that for want of proper moisture what springs out will shortly die and become rotten.—*Kennebec Jour.*

Indian Cure for Fever and Ague. David Ford, a respectable citizen of Ogdensburg, New York, where this disease prevails to a considerable extent, recommends the following as a certain cure: Take equal quantities of inside bark of Fir Balsam and Yellow Birch—boil them down to a very strong decoction or tea. Give to a grown person two spoonfuls in the same quantity of wine, just before eating, three times a day; young persons in proportion—say to a child five years old, 3-4ths of a table spoonful, with as much wine. It will probably at first produce sickness at the stomach and vomiting. Such are its effects sometimes, but it will cure.—*Ohio Repository.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 18, 1833.

A NEW KIND OF WHEAT.

MR. JOSEPH TRACY, of Windsor, Vt. Editor of the *Vermont Chronicle*, has sent us a bushel of Wheat, which he recommends as a valuable variety. It was originally brought from Virginia to New Haven, Conn. and afterwards cultivated in Hartford, Vt. Mr. Tracy states, that "it yields less straw, less chaff, and less bran than any other kind known among us. When perfect a bushel will weigh 63 pounds, and will afford from 42 to 44 pounds of flour of the first quality. This flour commands a higher price than that of ordinary 'good merchantable wheat.' The common crop on good wheat land is from 15 to 20 bushels per acre; on new land from 18 to 22. I have seen it yield at the rate of forty. One man, in West Fairlee, raised more than 170 bushels from four acres of new land. Much is raised on land that yields from 12 to 15 bushels. It is ready for the sickle a few days earlier than other wheat, and generally escapes injury from the Hessian fly, by being a little too old for that insect at the time when its ravages commence. The roots spread to an uncommon degree in the spring, so that the growth is much heavier than its early appearance promises. I recollect one half acre, which the owner had resolved to plough up in the spring, because it was *winter killed*, but it finally yielded him 13 bushels.

"In these last remarks, I have in view the region where this wheat came into notice; viz. the hills on the north of White River. These, with smaller tracts in the vicinity, having a southern or eastern exposure, are the best wheat lands in this region. They are large, steep, yet arable hills, of mica slate, with a little blue, primitive limestone. The natural growth is hemlock, white pine, very large maple, beech, birch, white and red oak, poplar, &c. And after the first growth is removed, sweet fern is apt to spring up, abundant and rank. Perhaps the best way of preparing this land for wheat is to pasture sheep upon it for a few years; after which it may be broken up, and summer fallowed, or, which is commonly quite as well, a crop of peas may be taken from it, or a crop of Indian corn, with a good dressing of manure from the barn yard. The bushel I send you is less perfect than I could wish. Some of the kernels have been injured by the yellow worm, which is doing much mischief among us. It contains also a few kernels of chess. This with cockle, rye and oats, had been utterly extirpated from the farm. It was introduced again, two or three years since by using seed from another farm, but is now nearly extinct."

We are under great obligations to Mr. Tracy for his communication, and the wheat with which it was accompanied; and agreeably to his advice shall offer it in small portions to such farmers as may be disposed to make experiments to ascertain its value for cultivation. When small parcels are sown, it will be easy to cull out the chess, cockle, rye, &c. which otherwise might contaminate the crop.

APPLES FOOD FOR FARM STOCK.

THE crop of apples the present season has been abundant, and we are told that farmers, in some

parts of the country, would be benefitted by any information, which would enable them profitably to dispose of their surplus produce of this kind. We will, with this view, republish the substance of an article which was originally printed for the *Brattleborough Messenger*, from whence it was extracted, and given in the *New England Farmer*, vol. v, p. 82.

Apples have been so exclusively devoted to making cider, that many believe them to be good for nothing else, and look upon it as a kind of sacrilege to appropriate them to any other use. Some good old women predicted that the curse of God would follow me because I let my hogs run in the orchard and eat my apples. Instead of making meat out of my apples, they would have me convert them into cider, and my cider into that most wholesome and cheering of all drinks, *cider brandy*. Many suppose, that as food for animals they are useless, and worse than useless. Their cattle have at times broken into their orchards, and they have always found that their cows have been dried up, and their cattle otherwise injured.—But would not their cattle have been as much injured by breaking into their cornfields; and will they thence conclude that corn is hurtful food? The very fact that cattle are hurt by them, when eaten to excess, proves them to be a wholesome and nutritious food; for I believe that cattle will eat nothing to excess (when not driven to it by excessive hunger), except what is healthful and nourishing.

That apples are nutritive is evident from the fact, that when eaten freely they abate the appetite for other food; and persons have, in many instances, been known to live wholly upon them for a length of time. Mr. D— of W. in a state of mental derangement, would eat no food but apples for fear of being poisoned, and he lived upon them forty days without injury to his health or flesh.—The spirit which the juice of apples yields is another proof of their nutritive qualities. Most animals are very fond of them. When apples and potatoes are thrown together to hogs, the apples will be eaten first.

I have tested by ten years experience the value of apples, as a food for animals. I keep five or six hogs in my orchard upon nothing but apples and a little swill; and have uniformly found them to grow faster than hogs fed upon any thing else, excepting grain. On the first of November they are very decent pork; after which I feed them about six weeks on grain, before I kill them; and I believe I have as fat hogs, and as good pork as my neighbors, who give to their hogs double the quantity of grain that I do to mine.

Having proved by experiment the utility of apples as food for hogs, I next turned my horse into a small orchard, which would yield about as many as he would eat. A neighbor of mine, a very judicious farmer, seeing my horse in my apples, informed me that I should spoil my horse—that he would get poor, and that I could not fatten him in the whole winter. Though somewhat alarmed by this information, I determined to persist in the experiment I had begun, and I found the result exactly the reverse of the prediction.—My horse never gained flesh faster, and I experienced no injury whatever.

The two past years, I kept fattening cows and oxen in an orchard where they could be full fed with apples, and with obviously good effects. I

have never known cattle fat faster on grass and pumpkins, or raw potatoes, than mine have on apples. Care must be taken not to turn them in hungry at first, as they will certainly eat to excess and injure themselves; and if they have not a full supply, there may be danger, when there is abundance of apples beaten off by storms; but a little care will prevent such injuries.

I have never had a creature choked by them, and I believe there is very little danger, when the creatures have liberty, and are accustomed to feed upon them.

Apples are worth nothing at all to make into cider, unless it be worth over fifty cents per barrel, and if you have to hire your labor, you may as well let them rot under the trees, as make them into cider. I consider my apples under the tree worth more for my creatures, than the cider would sell for, if made up for me for nothing. I make an estimate in this way; I call potatoes worth for cattle 12½ cents per bushel, and apples half price. Nine bushels of apples, the average quantity for a barrel, at 6½ cents will be 58 cents, or eight cents more than your cider will sell for. And I believe apples are worth more than half the price of potatoes, and am confident that when cattle are full fed on each, they will fat faster on apples than on potatoes.

I know of several farmers who fed their hogs on apples through the fore part of last winter, and are fully satisfied of the utility of the practice. As our fodder this winter will be deficient, I think it important, that those who have orchards, instead of wasting their time in making a useless quantity of cider, and cider brandy, should lay up their late apples to feed their hogs and other stock in winter.

I should also recommend to farmers to save their *pumice*. A load of pumice is worth as much as a load of pumpkins. I have given it to young cattle and to sheep in the fall, and in one instance I saved a load for my sheep in winter, which they ate with greediness and good effect.

A gentleman informed me that he first discovered the worth of pumice, as a food for neat cattle by the following fact. He owned a cider mill, immediately upon the road side, and the pumice was thrown into the street. When he began to make cider early in autumn, there were a number of lean half starved cattle running in the road, that came daily and ate his pumice, and though there was, at that season, very little grass in the road, yet these cattle, only by eating pumice, became before winter very good beef.

I am too well acquainted with the fixed prejudice of mankind to suppose that many will believe what I have written. If only one farmer in a hundred should be induced to make the experiment my expectations would be fully answered.

AGRICOLA.

By the Editor. BENJAMIN WHEELER, Esq. of Framingham, a gentleman favorably known to our readers, for his improvements in agriculture, informed us that he has for some years been in the habit of turning his cattle into his orchard, after the apples begin to fall off. He gives them the run of the orchard, in the forenoon, after the dew is off, for about an hour, and then turns them out, lest they should injure the trees, or hurt themselves by eating too much fruit.

REGULATIONS OF THE PAWTUCKET CATTLE SHOW AND FAIR, FOR 1833.

At a meeting of the Standing Committee of the R. I. Society for the Encouragement of Domestic Industry, holden at Pawtucket, on the 11th of Sept. 1833, the following regulations for the Cattle Show and Fair, to be holden on the 25th day of Sept. instant, were adopted by the Committee.

The Society will meet at their Hall on *Wednesday*, the 25th inst. at 8 o'clock, A. M. and proceed to the election of officers and the transaction of other business.

The Committee on Shop Manufactures, Household Manufactures, Butter, Cheese, and Agricultural Crops, will meet on *Tuesday*, the 24th inst. (the day previous to the Show) at 8 P. M. and adjudge the premiums of that day.

The Committee on Neat Stock, Working Cattle, Horses, Sheep and Swine, will meet on *Wednesday*, (the day of the Show) at $\frac{1}{2}$ past 9 A. M. and proceed immediately to adjudge the premiums.

The Committee on the Ploughing Match will meet on *Wednesday*, at 11 A. M. and at 2 P. M. and the Ploughing Match will commence at $\frac{1}{2}$ past 2 P. M.

The Standing Committee will meet on *Wednesday*, at 3 P. M. for the purpose of receiving the reports of the viewing Committees.

The Premiums will be declared at 4 o'clock.

Auction Sales of Premium Articles, at 4 P. M. *Wednesday*.

Auction Sales of Live Stock, Trees, Shrubbery, Plants, and others, will be under the direction of the Committee of Arrangements.

The Hall will be thrown open to visitors, only, on *Wednesday*, from 11 A. M. to 4 P. M.

The Premiums will be paid at 5 P. M. in the order they stand on the Show bill.

All articles of Shop and Household manufacture, Butter, Cheese, Cider, and Agricultural Crops to be exhibited, must be entered and delivered at the Society's Hall by 9 o'clock, on Tuesday morning, or they will not be noticed.

All Stock must be entered by 8 o'clock on Tuesday evening, and placed in the pens, by 8 o'clock on Wednesday morning, and can be removed by 4 o'clock in the afternoon. Those who withdraw their stock before that time, will forfeit their premiums.

The Assistant Secretaries will attend at the Hall from 9 o'clock on *Monday*, the 23d, until 9 o'clock of the evening of the 25th.

Dinner, on Wednesday, will be ready at 1 o'clock, P. M. precisely, at the Mechanics' Hall, and members will call on the Secretaries for tickets, being free, before half past 11 o'clock in the forenoon.

The following gentlemen were appointed a Committee to report at the annual meeting, in relation to the progress of the Classical, Agricultural and Mechanical school, under the patronage of the Society.

John Pitman, Asa Messer, Zachariah Allen, John Jenckes, Solomon Drown, Jesse Tourtellot, Thomas Holden, (S. R.) Richard W. Greene.

The examination of the School, by the Standing Committee of the Society, will take place on *Monday*, the 23d inst. at 8 o'clock, A. M.

RICHARD WARD GREENE, *Secretary*.

Pawtucket, September 11th, 1833.

For COMMITTEES, &c.—see p. 75.

GREEN HOUSE GLASS.

LORING, & KUPFER, No. 10 Merchants Row, have on hand a very large supply of thick Glass suitable for Green Houses and Factories. Also Plate Glass of a superior quality and thickness, with other descriptions of Window Glass, all Sizes, in large or small quantities, at the lowest prices.

NOTICE.

The Committee on Farms, Fruit, Mulberry and Forest Trees, and Shrubs, will meet at the Middlesex Hotel, in Concord, on Monday, the 23d of September, inst., at 9 o'clock, A. M. and proceed to view such Farms, &c. as may be formally entered for premiums.

Per order, JAMES BROWN, *Chairman*,
Concord, Sept 14, 1833. sept18

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. Merino, a very superior article, and all the most desirable colors, imported expressly for the subscriber—4 cases 3-4 Eng. do. of various colors and qualities—4 cases Circassians, very superior qualities and various colors—1 case superior Goats Hair Camblet—4 bales 4-4 5-4 and 6-4 Bocking, green and mixed—12 bales splendid Tarrifville Hearth rugs—5 bales Eng. low priced do. do.—54 bales Domets, white, yellow, red, &c.—10 bales Flannels, Eng. Welsh, and American—10 bales Cotton Carpeting, striped and blocked—6 bales Russia Diaper—1 bale Canton Flannel, lower than the cost of importation—3 bales American Cotton Flannels, bleached and unbleached—1 bale White Counterpanes, all sizes—10 bales superior London Row Blankets from 10-4 to 14-4—7 bales real Indigo Checks from 3-4 to 5-4—3 bales American Gingham—2 cases Eng. Gingham—29 bales cotton Bating—25 bales Pillisse Wadding, 12 bales black Wadding—5 cases Embossed Furniture Dimety—2 cases Embossed Cambric, for stage lining—20 cases Prints, all patterns and prices, Eng. French, and American—35 cases Bleached Cottons—50 bales unbleached cotton—10 bales Ticking 3-4, 7-8 and 4-4, some very superior quality—2 cases Sinchaws—2 cases Sarsnets—2 cases Satin Levantines, superior quality—3 cases Levantines, low priced—7 cases Crape Dresses, all colors—5 cases Linens, Lawns, and Shirtings 4-4 to 10-4 with a very extensive assortment of Cambrics and Cambric Muslins, Bobbinette and Grecian lace, 4-4 and 6-4 Swiss nonsook, Book Jaconett plain and figured muslins—Hosiery and every variety of seasonable Dry Goods.

Country merchants will do well to call and examine for themselves. sept18.

VALUABLE FARM AT AUCTION OR PRIVATE SALE.

THE Subscriber offers for sale a Farm situated in the town of Marlboro', Mass. about half way between Howes' Tavern and the Lower Meeting-House. It consists of 140 acres of excellent land, with a large two-story Dwelling House, two Barns, Chaise and other Out-houses, with two fine Wells of Water. About 70 acres of the land is covered with a fine growth of the best quality of Wood; the remainder, consisting of Mowing Lands, Tillage and Orchard, is in a high state of cultivation. It now supports 20 head of horned cattle, horses, swine, &c.

For the last 25 years, this estate has been improved by Mr. William Wilson, deceased, and for 50 years previous thereto, it was known as "Munroe's Tavern." The excellent quality of its soil, the large and valuable quantity of wood, and its other numerous advantages, make it a most desirable situation for a farmer; while its situation (on the old road to Worcester, on which the travel is great, the distance from any other tavern and its former notoriety as one,) makes it a no less desirable situation for a Tavern again.

The above estate, free from all incumbrances whatever, will be sold on Friday the first day of November, unless previously disposed of by private sale. As also, at the same time, all the cattle, a large quantity of hay and grain, farming utensils, &c. as are not previously disposed of.

Terms of purchase made known on the day of sale. Likewise, several other lots of land belonging to the same estate, will be sold at the same time.

JOSIAH WILSON, Administrator.

For further information, apply to WEBBER WILSON, on the premises, or to Messrs. LOT WHEELWRIGHT & SON, No. 46 Central Wharf. sept 11

BRIGHTON MARKET.—MONDAY, SEPT. 9, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 836 Beef Cattle, (including about 30 unsold last week,) 140 Stores, 2600 Sheep, and 740 Swine.

PRICES. Beef Cattle.—No particular variation from last week. We quote prime at \$5 a 5 75; good at 4 50 a 5; thin, and Steers and Cows at 3 a 4 25.

About 100 Beef Cattle were taken by the Barreliers.

Cows and Calves. We noticed sales at \$22, 23, 27, and 30. Sheep.—In good demand and sales quick; we noticed sales at \$1 42, 1 62, 1 67, 1 75, 1 84, 2 00, 2 17, and 3 33.

Swine.—We noticed one lot of about 100 taken at 4 1/2. A lot of 20 Sows and Barrows selected at 5c; and a lot of 15 at the same. A small lot of large Sows at 4c; at retail 5c. for Sows and 6c. for Barrows.

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug 28

MISCELLANY.

From *Blackwood's Magazine* for August.
THE WATER-LILY.

BY MRS. HEMANS.

The Water-Lilies, that are serene in the calm,
clear water, but no less serene and black among the scowling
waves.—*Lights and Shadows of Scottish Life.*

Oh! beautiful thou art,
Thou sculpture like and stately River-Queen!
Crowning the depths, as with the light serene
Of a pure heart.

Bright Lily of the wave!
Rising in fearless grace with every swell,
Thou seem'st as if a spirit meekly brave
Dwelt in thy cell;

Lifting alike thy head
Of placid beauty, feminine yet free,
Whether with foam or pictured azure spread
The waters be.

What is like thee, fair flower,
The gentle and the firm? thus bearing up
To the blue sky that alabaster cup,
As to the shower?

Oh! Love is most like thee,
The Love of Woman; quivering to the blast
Through every nerve, yet rooted deep and fast,
'Midst Life's dark sea.

And Faith—oh! is not Faith
Like thee, too, Lily? springing into light,
Still buoyantly above the billows' might,
Through the storm's breath?

Yes, link'd with such high thoughts,
Flower, let thine image in my bosom lie!
Till something there of its own purity
And peace be wrought:

Something yet more divine
Than the clear, pearly, virgin lustre shed,
Forth from thy breast upon the river's bed,
As a pure shrine.

IRRITABILITY, &c. OF LITERARY MEN ACCOUNTED FOR.

MR. MADDEN, in his book, the *Infirmities of Genius Illustrated*, sets out with a very acute examination of the causes why it is that literary men should have been so generally distinguished as an irritable race, subject to numerous infirmities of mind as well as body, and seldom blessed with the advantages of prosperity and happiness as the result of their labors. He says, that in general the knowledge of the world found in the minds of literary men is very limited indeed, because more of their time has been spent in the closet than in mixing with the business of life. Hence they bring with them, on their occasional visits to society, a spirit of uncompromising independence; a sense of self-superiority, which must necessarily influence their behavior in such a way as to offend the pride and excite the aversion of those with whom they associate. But even this misfortune is trifling, compared with those calamities which more particularly affect the physical and moral faculties of the literary man, and which are to be attributed entirely to excessive mental application. These effects too often consist of waywardness of temper, testiness of humor, and capriciousness of conduct, which operate in rendering the man of genius obnoxious to strangers, and at last very fatiguing to his friends. But the misfortunes to which the studious man is liable do not end here; his enthusiasm in some particular pursuit will induce him,

sooner or later, to lessen the interval appointed for his repose; this he does by degrees, until at last the whole night is habitually sacrificed. The necessary consequence of the repeated privation of sleep is great exhaustion of the vital powers, which, in too many instances, are sought to be restored to their natural tone by stimulants; and thus between the depression on the one hand, and the artificial excitement on the other, life degenerates into an eccentric principle as it were—a comet, whose movements are governed by no certain laws. The process whereby excessive mental labor produces a considerable derangement of the regular physical state of the body may be shortly explained in the language of Tissot: the brain is in action when the mind is thinking; the prolongation of the employment of the mind tends to fatigue it, and as no organ which is weakened, by whatever cause, can perform its functions with the same success as it did in the healthy state, so is there a derangement of the conditions of all those parts over which the brain has an influence. But the brain is the centre from which the nerves of the body proceed, and, therefore, a disturbance of the function of the brain is followed by a corresponding change throughout the whole extent of the living system.

EMINENCE ATTAINED BY MEN OF OBSCURE ORIGIN.

MANY of the most eminent men in literature, science and art, have sprung up in obscurity.—Some will instantly occur to the mind from among the living as well as the dead who have laid society under the deepest obligation; but there are others whose claims are not so commonly remembered. It is calculated, for instance, that above a million and a half chaldrons of coals are annually consumed in London; and the amazing extension of the coal trade to meet such demands is to be traced to men called "viewers," who have generally raised themselves from lower situations. Machinery was absolutely necessary to obtain so many millions of tons of the first necessities of life, and that at a rate exceedingly low, and this provided by Newcomen, the plumber, and Smea and Watt the watchmakers. The cheap and elegant garments, which give bread to about two millions of people, instead of fifty thousand, which raised the importation of cotton wool from less than 2,000,000, to 200,000,000 pounds per annum, and which increased the annual produce of the manufacture from 200,000*l.* to 36,000,000*l.*, are to be traced through subsequent improvements to Arkwright and Crompton the barbers. A rude and inconsiderable manufacture was changed into an elegant art, and an important branch of national commerce, by Wedgwood the potter. Inland navigation, which enabled manufactures to import the raw materials and export the finished goods, was devised and executed by Brindley the millwright; and it would be easy to accumulate a great number of instances in which persons of humble birth have greatly promoted the general good.—*Wilder's Early Discipline.*

A gentleman who married a lackadaisical young lady, was visited by an old friend. The lady, after enlarging in an animated strain upon the pleasures of London, had retired for the night, and the friend exclaimed—"Why, Jack, your wife is not so pensive as she used to be"—to which the other replied with a shrug, "No, she has left that off; she is now *ex-pensive*."

FRUIT TREES.
ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection from 300 to 400 hard and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks.—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Coelebs, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. optf

BROOKS' PATENT SILK SPINNER.

THE public attention is invited to this machine. It is adapted to domestic use, is simple in its construction, occupies a small space, and may be used to advantage by women and children. This machine may be obtained by applying to T. R. NEWELL, at the Agricultural Warehouse, No. 52 North Market street, Boston; or to the Patentee, ADAM BROOKS. SITUATE, July 22, 1833.

TO SUBSCRIBERS.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half-bound and lettered, at 75 cents per volume, by leaving them at the Farmer Office. july 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

CANADA COTTON.

IN the New England Farmer, No. 17, vol. 10, page 131, it is mentioned in an article under the above head, that the lads of Dr. Stewart Chisholm of Glengary, in Upper Canada, had spun a large quantity of this wild Cotton, and had it woven into cloth. The discovery of the capability of this article's being converted into cloth is attributed to the above lads, and it is very probable that they had not known of the experiments being made before. But I find, by reference to the Domestic Encyclopædia, article Swallow Wort, (another name for the plant,) that the American Editor of that work, Dr. Mease, mentions, on the authority of Dr. Guthrie, (Manchester Memoirs, vol. v.) that "the plant is cultivated extensively in Germany, and that stuffs have been made of it, which vied in lustre with the animal silk."

The botanical name of the plant is *Asclepias Syriaca*. It abounds throughout N. America, but especially in N. York, and further north, near rivers and streams; and I have often wondered that it has not been applied for the purpose of filling bed-spreads, as a substitute for the expensive article, eider-down, for which it would answer admirably; probably it might require quilting. This might be ascertained by experiment: the ingenuity of our women would doubtless find out the best way of using it.

I should suppose that the addition of some cotton to the silk of the plant would facilitate the spinning of it into thread. ECONOMICUS.

For the New England Farmer.

NEW MANUFACTURE OF FLOWER POTS.

Extract from a letter from Mr. John Thornton, of New Bedford, Mass. to the Editor of the New England Farmer.

THOS. G. FESSENDEN, Esq.—Sir, "I take the liberty to send you, by the sloop Pomona, Capt. Stackhouse, four Flower Pots, of different sizes, as a specimen recently manufactured in this town; which you will please accept as a token of friendship, from an ex-editorial brother."

"The clay of which the pots are made was brought from Europe, 2000 miles up the river Rhine; and the superior excellence of them, compared with those in common use, especially the glazed kind, consists principally in their porosity, a quality in Flower pots, indispensable to the vigorous and continued growth of plants."

"A Pottery has recently been established in this town, under the superintendence of two brothers, by the name of Dixon, who have manufactured a large lot of these Pots, which I have purchased; and one object in sending you a specimen, is, to ask your opinion whether they would probably meet with a ready sale in the Boston market.—The retail prices of the sizes I send you, in this town, are 5s. 6d., 5s. and 4s. 6d. a pair. But if I could have an order for 50 or 100 pairs, I should put them considerably lower. I could furnish 500 of them if wanted."

We think the Flower Pots above described are very neat, handsome, as well as useful articles; and would recommend them to the attention of florists, and others fond of fine plants, as elegant receptacles for the fairest products of ornamental culture.

EDITOR.

For the New England Farmer.

PICKLED CUCUMBERS.

MR. EDITOR, I have always thought that opposition and competition on all subjects is for the benefit of the community. Now as every one thinks his opinion best, his horse or his boat the fastest, his wife or his sweetheart the handsomest, so I intend upon the strength of my opinion to differ from a correspondent in your last paper, on the subject of making Pickles. I learned when quite a boy, from an old sea captain, a method of pickling which he obtained in the West Indies, by which I think as good or better pickles can be procured in less time, and with much less trouble, than by the process proposed by your correspondent. Beside, by the method which I propose I have the advantage of him, inasmuch as he is not sure of the success of his plan, while from six years practice in making them, and from the plaudits of epicures for the same length of time, I can safely vouch for the superiority of pickles cured in my way. Another advantage is, that they are neither affected by age, season or climate. But here is the recipe, simple enough that every one can judge of it for themselves.—To each hundred of cucumbers put a pint of salt, and pour in boiling water sufficient to cover the whole. Cover them tight to prevent the steam from escaping, and in this condition let them stand for 24 hours. They are then to be taken out, and after being wiped perfectly dry, care being taken that the skin is not broken, placed in the jar in which they are to be kept. Boiling vinegar (if spice is to be used it should be boiled with the vinegar) is then to be put to them, the jar closed tight, and in a fortnight delicious hard pickles are produced, as green as the day they were upon the vines.

WORCESTER CATTLE SHOW.

THE Committee of Arrangements for the approaching Cattle Show and Exhibition of Manufactures by the Worcester County Agricultural Society, on WEDNESDAY, the 9th day of October next, have been engaged in the discharge of the duty assigned them, and have made the necessary preparation for the occasion, in the fullest confidence that no less interest would be evinced on that day by their agricultural brethren, than has been witnessed on any former year. They have the pleasure of informing their fellow citizens that the Address will be delivered by the Hon. JUDGE SKRONE. The Premiums are so liberal as to invite strong competition for the honors of the Society. The last year, in consequence of the very great number of entries for the Ploughing Match, the Committee were obliged to go to an inconvenient distance for a lot of land sufficiently large to accommodate the number whom they had reason to expect would be competitors in this part of the exhibition, when they might have been better accommodated, could they have known what would

be the number of teams that actually would compete for those premiums. This year the Committee will expect that all those who enter for the Ploughing Match, will be on the ground at the time appointed, with their teams and tools, ready for the work assigned them. They are reminded that such entries must be made before the 30th inst., with WILLIAM D. WHEELER, the Recording Secretary.

The Committee are authorized to offer a gratuity of \$25 for a Team of Working Oxen, to consist of not less than 50 yokes, belonging to the same town, and such as shall be approved by the Committee on Working Oxen. They would respectfully solicit the attention of the patriotic farmers of the neighboring towns, to an object which will add so much to the interest of the exhibition, and it is requested that the intention of exhibiting such a team may be seasonably communicated to the Recording Secretary.

They trust that they shall not be disappointed in the expectation that their manufacturing friends will aid in the importance of the show, by exhibiting specimens of their skill. To their fair friends, they have heretofore been greatly indebted for the interest they have evinced for the welfare of the Society—they are requested to continue their favor by sending to the Hall the evidence of the excellence of their handy work. It is important that all articles of Manufactures should be received at the Society's Hall before 11 A. M. of the day preceding the Show, that the several Committees may have proper time for their examination. A suitable person will be at the Hall on the Monday previous, to take charge of any articles which may be committed to his care, and the Committee will use every precaution in their power to prevent all injury to the goods exhibited.

Mr. Jones Estabrook, at the Central Hotel, will provide a Dinner for the Society, and it is requested that those who may at that time have good Fruit, would have the goodness to send a portion of it to Mr. Estabrook, to be exhibited on the Dinner Table.

From the Albany Gazette.

CULTURE OF WHEAT.

ON an acre and three quarters of land, I have raised sixty-two bushels and a half of WHEAT—the which the bearer now carries to market. The land has been pastured for several years—I put no manure of any kind on it—ploughed and harrowed it at different times till it was mellow and fine—sowed it about the middle of September, and have reaped it as above stated, nearly 36 bushels an acre.

There were two things, which I presume caused this more than common crop, (more than common

in this part of the state,)—my people not judging rightly of the quantity of land, or having a heavy hand, as we say, sowed $2\frac{1}{2}$ bushels to the acre—and after it was sowed, I took pains in cutting and clearing out ditches, or drains, through the piece, leaving the lands about 12 feet wide. The thick sowing and draining gave the superiority to my crop, above those of my neighbors. Some of the wheat froze out, but enough remained—had the water not been carried off, the greater part (for it was low land) would have been frozen out.

If you choose to publish, and any person chooses to try what can be gained by getting their land in good order—sowing thick, and draining where necessary—I wish you and they may reap abundantly.

A FARMER.

TEMPERANCE CONVENTION.

This Convention assembled in Worcester, on Wednesday last, and consisted of about five hundred delegates, of whom thirty-four were from Suffolk county, and forty from Essex county. It was called to order by Dr. J. C. Warren, when a committee, of which Gen. Sullivan was chairman, was appointed to nominate a list of officers.—Their report was unanimously accepted; and the Convention was organized by the election of Governor Lincoln as President; Samuel Lathrop, of West Springfield, Dr. John C. Warren, of Boston, and William Reed, of Marblehead, as Vice Presidents; and Emery Washburn, of Worcester, J. W. Yeomans, of Pittsfield, T. A. Greene, of New Bedford, and Luther S. Cushing, of Cambridge, as Secretaries. Prayers were offered by Rev. Mr. Perry, of Bradford. A committee consisting of Justin Edwards, William Sullivan, Hosea Hildreth, John Read, Stephen C. Phillips and Abijah Bigelow, was appointed to prepare rules for the government of the Convention. Another committee, appointed to devise measures for a more complete Temperance organization throughout the State, consisted of Messrs. J. Tappan of Boston, G. P. Perry of Bradford, Jackson of Newton, Foster of Worcester, Doolittle and Newcomb of Belchertown, Yeomans of Pittsfield, Alden of Bradford, Arnold of New Bedford, Bassett of Barnstable, and Sprague of Duxbury. On the evening of Wednesday, several eloquent addresses were made, among which that of Rev. Mr. Taylor of Boston, is mentioned as very striking and impressive.

The Convention, after an active and exceedingly interesting session of two days, broke up on Thursday afternoon at 6 o'clock. An address to the People of the State was adopted, which with the other proceedings, will be published soon.—The thanks of the Convention were voted to its officers; and the President, in their behalf, expressed his own lively gratification in the happiest terms. It is but justice to this gentleman to say, that his promptness and plainness in the despatch of business, and his dignified and gentlemanly address, were equally the subject of universal admiration. The morning session was opened with prayer by the Rev. Mr. Blagden of Boston, and the Convention closed with similar services by the Rev. Mr. Walker of Charlestown. The most gratifying spirit of mingled energy and mildness strongly characterized the proceedings throughout. It has never been our fortune to witness the earnest deliberations of a body of five hundred men, on some of the most interesting topics of the day, conducted with such perfect harmony and good humor.

We did not pass the evening in Worcester, but understand that addresses were made, at a fully attended public meeting, by Mr. Phillips of Salem and other gentlemen.—*Mercantile Journal*.

MASS. HORTICULTURAL SOCIETY.

For Horticultural Festival, see page 85.

OFFICERS OF THE MASSACHUSETTS HORTICULTURAL SOCIETY,

Elected Sept. 21, 1833.

PRESIDENT—Henry A. S. Dearborn, *Roxbury*.

VICE PRESIDENTS—Zebedee Cook, Jr. *Boston*; Elijah Vose, *Dorchester*; Enoch Bartlett, *Roxbury*; S. A. Shurtleff, *Boston*.

TREASURER—William Worthington.

CORRESPONDING SECRETARY—Jacob Bigelow, *M. D. Boston*.

RECORDING SECRETARY—Robert Treat Paine, *Boston*.

COUNSELLORS—Augustus Aspinwall, *Brooklyn*; Thomas Brewer, *Roxbury*; Henry A. Breed, *Lynn*; Benj. W. Crowninshield, *Boston*; J. G. Cogswell, *Northampton*; Nathaniel Davenport, *Milton*; E. Hersey Derby, *Salem*; Samuel Downer, *Dorchester*; Oliver Fiske, *Worcester*; B. V. French, *Boston*; J. M. Gourgas, *Weston*; T. W. Harris, *M. D. Cambridge*; Samuel Jaques, Jr. *Charlestown*; Jos. G. Joy, *Boston*; William Kenrick, *Newton*; John Lemist, *Roxbury*; S. A. Shurtleff, *Boston*; E. M. Richards, *Dedham*; Benjamin Rodman, *New Bedford*; John B. Russell, *Boston*; Charles Senior, *Roxbury*; William H. Sumner, *Dorchester*; Charles Tappan, *Boston*; Jacob Tidd, *Roxbury*; Jona. Winship, *Brighton*; William Worthington, *Dorchester*; Aaron D. Williams, *Roxbury*; J. W. Webster, *Cambridge*; Geo. W. Pratt, *Geo. W. Brimmer, Boston*; David Haggerston, *Charlestown*; Charles Lawrence, *Salem*.

PROFESSOR OF BOTANY AND VEGETABLE PHYSIOLOGY—John L. Russell.

PROFESSOR OF ENTOMOLOGY—T. W. Harris, *M. D.*

PROFESSOR OF HORTICULTURAL CHEMISTRY—J. W. Webster, *M. D.*

STANDING COMMITTEES—On Fruit Trees, Fruit, &c. Robert Manning, *Chairman*—Samuel Downer, Oliver Fiske, Charles Senior, William Kenrick, E. M. Richards, B. V. French, Samuel Pond, Thos. Mason.

On the Culture and Products of the Kitchen Garden. Daniel Chandler, *Chairman*—Jacob Tidd, Aaron D. Williams, John B. Russell, Nathaniel Davenport, Leonard Stone.

On Ornamental Trees, Shrubs, Flowers, and Green Houses. Jonathan Winship, *Chairman*—Joseph G. Joy, David Haggerston, George W. Pratt, Samuel Walker.

On the Library. H. A. S. Dearborn, *Chairman*—Jacob Bigelow, T. W. Harris, E. M. Derby Z. Cook, Jr., Geo. W. Pratt.

On the Synonymes of Fruits. John Lovell, *Chairman*—Robert Manning, Samuel Downer.

On the Garden and Cemetery. Hon. Judge Story, *Chairman*—H. A. S. Dearborn, Jacob Bigelow, M. D. George Bond, Z. Cook, Jr. C. A. Gould, Charles Brown, Joseph P. Bradlee, C. P. Curtis.

Executive Committee of the Council. Z. Cook, Jr. *Chairman*—G. W. Pratt, Cheever Nevhall, Charles Tappan, Joseph P. Bradlee.

ITEMS.

A good sized Pear. A Pear, which grew on a tree belonging to Mr. Richard K. Brickett of Hampstead, N. H. measured thirteen inches and three quarters in circumference, and weighing one pound five and a half ounces. Quite a subject for a meal!

Large Fruit. We saw the other day, an Apple from the farm of Joseph Houghton of Berlin, in this county, which measured $4\frac{1}{2}$ inches in diameter and 14 in circumference, and weighed $16\frac{1}{2}$ ounces.—*Worcester Spy*.

The Colonization Society of the city of New-York, are about fitting out a vessel from Liberia, to convey to that country a number of manumitted slaves. Between twenty and thirty of the blacks were the property of a gentleman in Virginia, who released them from slavery on condition of their immediately leaving the country. The Society solicit aid from their fellow citizens, to defray the expenses of this enterprise.

The number of spindles stopped in Fall River, for want of water, is stated in the Monitor of Saturday, to be 15,000. The whole number of spindles is over 31,000. The Mills will be stopped on Thursday next for the purpose of digging out the canal or river that leads from the pond to the Mills. It will probably require a week to complete the work.

Wheat. The Farmers in the vicinity of Syracuse, N. Y. have been very prosperous in harvesting their wheat the present season, and some of them have got in near 3000 bushels, and others 1500, 1800, &c.

Oats. The Springfield Republican says, Mr. James Kent of West Springfield, has raised this season, upon an acre of land, a good one hundred bushels of oats.

The Shakers near Lexington, Ky. have commenced the raising of silk-worms, and the preparing and manufacture of silk. Samples received in Philadelphia are highly extolled.

Machine for Spinning Hemp. Mr. Joseph Westerman, of New York, says the N. Y. Courier and Enquirer, has invented a machine, by which rope yarn is spun from hemp, without the process of hatchelling, and, in consequence, without the usual loss of eight or ten per ct. from that cause.—The machine is simple, and its utility has been tested. It produces a yarn far superior in smoothness and strength to that produced by hand spinning; and the saving, it is said, would be fifty per cent.

MAILS TO CANADA.

It would appear by the following paragraph, which comes marked for our notice in the St. Catharine's "Colonial Argus," that the recent directions of the U. S. P. O. department, on the subject of Canadian postage, originated in erroneous information with respect to the regulations of the British post-office.

We are authorized in saying that no such instructions as alluded to [in the circular of Mr. Melson,] have been received by the Postmasters in Upper Canada—but the very reverse. Subscribers for American newspapers, as well as publishers, have uniformly paid United States postage on newspapers and letters at the Canada offices, and which has been regularly accounted for by our Postmasters, and no instructions received to the contrary.—*Albany Argus*.

MILCH COWS.

THE American Farmer, in the course of a long article on the treatment of Cows, mentions the following circumstance. It strikes us as being worthy of the consideration of farmers, and those who keep Cows. "And, let us remark, good water is as essential to good milch-yielding as good pasture. We had a cow last summer that yielded five gallons of rich milk a day. She ran in a tolerable pasture, but there was a stream of pure spring water running through it. We also kept salt constantly within her reach. The same cow, this summer, in a much better pasture, does not yield three gallons of milk. The reason of this falling off is, that she is supplied with water from a pump, occasionally, when her attendants conceive she wants it—not when she thinks she wants it, which is the great point. She also gets salt 'as it happens.'"—*Bost. Centinel*.

BROOM CORN.

BROOM CORN is cultivated in the Hadley Meadows and about that town extensively this year.—Last season but little of it was raised, in consequence of the reduction of prices occasioned by an excess of it being planted the preceding year. The stock of brush now on hand is light and the market not glutted, scarcely supplied, and the crop this year will yield well and good prices be sustained. Mr. Shipman, of Hadley, is one of the most extensive, if not the largest Broom-manufacturers in New England. His Factory is spacious, and not less than Fifty thousand corn Brooms, we suspect, are annually made and sold by him.—Making Brooms is a striking illustration of the value of a suitable systematic division of labor. The handles are made by one set of men. The brush prepared by another. Tied on by a third, the trimming performed by a fourth, and painting or staining the handle and putting on the *finishing touch* administered by a fifth. In this manner a Broom, which if all the component parts successively were made by one man, would cost from seventy-five cents to a dollar, is now afforded, in consequence of the proper subdivision of labor, at less than one sixth part of that sum.—*Northampton Courier*.

FENCES.

No man possessing a particle of the pride which should be felt by every farmer in the excellence and utility of his profession, can travel through any section of our country without feeling that pride deeply mortified at the miserable manner in which too many of our farms are fenced, and the total neglect of providing means to repair those so rapidly rotting away. It is a fact, and one which should be known and felt, that scarcely any part of the United States is more deficient in good fencing stuffs after the land has once been cleared than west New-York. We have few of those inexhaustible quarries of stone found in the eastern mountains—our fields furnish after repeated ploughings but very inadequate quantities of loose stones for fencing—and the axe is used almost as unsparingly in our few remaining forests, as it was when thirty years ago they overshadowed the whole land. The consequence of this state of things is easily foretold—in fact, it is already seen and felt. The worn fences of the first settlers have mouldered away, and the fields at first small have gradually enlarged their bounds, until on many farms the outside fence is all that deserves

the name. Boys and girls that ought to be at school, pokes and clogs, and fetters of all varieties, are employed as substitutes for fences; and dogs are multiplied to prey on the flocks of the thrifty and provident farmer. This state of things ought not to exist—there is no necessity for it—plant nurseries of trees suitable for fencing stuffs, and in a few years your farms will advance in price fifty per cent. The chesnut, the locust, &c. are easily raised and are of rapid growth—impervious hedges are readily formed, and no man should allow a stone as large as a four pound shot to lie on a field devoted to mowing or tillage; all should be worked up into fences. The man whose farm is divided into fields larger than ten acres, may depend that he does not understand his true interest.—*Auburn Journal*.

AUGUST, 1833.

THIS month, it appears, has been the coolest August within our recollection. It is two degrees cooler than August of last year, and one degree cooler than August 1829, the coolest in the last sixteen years. The mean average of August for the last twelve years, was about four degrees warmer than this. The three summer months this year have averaged very low, being nearly the same as last year, and nearly six degrees below the general average of twelve or fifteen years.

The weather during the month has been pleasant and delightful, and though so very low an average heat was exhibited, there was no appearance of frost. The crops that have been reaped, have proved very abundant, and the important one of Indian Corn bids fair to be more than an average.

But little rain has fallen during the month. The most abundant shower was on the 4th, which fell in torrents, accompanied with the most terrific thunder and vivid flashes of lightning, ever remembered by our oldest inhabitants.—*Newport Mercury*.

SPOTS IN THE SUN.

A SPOT on the Sun was seen in this town, yesterday, for the first time since the Spring. It probably entered on the Sun on Wednesday, and will occupy about a fortnight in crossing his disc. It is quite small and cannot be seen without a telescope.

Perhaps it may be remembered, that the summer of 1816 was one of the coldest ever experienced in New England; a severe frost having occurred in every month, proving destructive to the hopes of the agriculturist and "causing as much loss as the embargo and war." This remarkable coldness was generally ascribed to the immense spots visible the whole summer on the Sun, which were sufficiently large to be seen through a piece of blackened glass, and were ascertained to cover about one third of his surface. But how shall we account for the almost equal coldness of the Summer of 1833. It cannot be ascribed to the same cause as that of 1816, as during the last four or five months we have not been able to perceive any spot, and the whole surface of the Sun has appeared, even when viewed through a powerful telescope, clear and serene.—*New Bedford Mercury*.

CHLORIDE OF SODA.

A SINGULAR case of a severe burn cured by the use of a solution of the chloride of soda, is recorded in the London Lancet. An attorney, in attempt-

ing to put out the flames that had attacked the curtains of his bed, had got his hands burned—blistered, but not broken. He sent for a couple of quarts of the lotion, (4 oz. of the solution to a pint of water,) had it poured into soup plates, wrapped his hands in lint, as no skin was broken, and so kept them for some time. Next morning he was so perfectly well that only one small dried patch of burn remained; yet an hour and a half had elapsed before the application. The same solution has been equally effectual in scalds and bruises. It never fails almost immediately to heal a 'black eye.' When the chloride is used for scalds, it is necessary to use with it in the after applications some spermaceti oil.—*Philadelphia Sen*.

HINTS ON INDIGESTION.

To lay down general rules for dietetics, to predict or threaten the same terrific catastrophe to every sinning gourmand; to explain by the same universal cause, "indigestion," every *malada* to which flesh is heir to, is absurd, even when such generalizations are confined to a large class of society in this country, without wandering abroad. One can no more find two stomachs than two noses alike. The whole secret lies in learning how the stomach of our patient has been *educated*, and according to that education to deal with it. This involves an individuality in the attention to be given in cases of "stomach complaints," which physicians would find too troublesome; yet without it justice cannot be done to the patients. It is sheer nonsense to talk of classing *human* stomachs and *civilized* stomachs; stomachs of drunkards and stomachs of abstemious people; stomachs of aldermen and stomachs of Pythagoreans; stomachs of literary men, lawyers, physicians, and parsons, and stomachs of young collegians, sportsmen, and dandies, under one and the same rule. Each has had its physical education as peculiarly different from that of the rest as that which the possessor has received at the nursery or college; and each must be dealt with accordingly. A friend of mine, who had occasion to see a physician write several directions for invalids laboring under what are called "stomach complaints," wondered that he did not give a printed circular to each, in imitation of a great authority, who had always the same printed page to refer to, and thus save himself the trouble. Had he followed such a plan, he would have done his patients injustice; for, as far as my own experience goes, I am confident he never met with *two stomachs* alike.—*Dr. Granville*.

THE COTTAGE.

If men did but know what felicity dwells in the cottage of a virtuous man—how sound he sleeps, how quiet his breast, how composed his mind, how free from care, how easy his provision, how healthy his morning, how sober his night, how moist his mouth, how joyful his heart—they would never admire the noises, the diseases, the throng of passions, and the violence of unnatural appetites, that fill the houses of the luxurious, and the hearts of the ambitious.—*Jeremy Taylor*.

ARDENT SPIRITS.

No "proper place" for it.—A law of Virginia allows the retailing of spirituous liquors at "proper places," in the different counties. In one of the counties, the Magistrates have decided that there are no "proper places" within their jurisdiction for such a purpose.

From the American Farmer.

BARNITZ'S BREED OF HOGS.

In one of your late papers, you noticed in terms of commendation, the breed of hogs which I have kept upon my farm; and I now offer to you a brief account of their origin and peculiar properties of value. In the valleys of Pennsylvania, the farmers generally have distilleries, and their stock of hogs is obtained from the western drovers, who collect them as they can get them. The distillery affords abundance of food, and the good and bad, when moderately fat, are sold in a mixed lot for the city markets, without much regard to quality, or any discrimination as to the separate values of the animals.

Chester county seems to form an exception; there are few distilleries there; and the farmers, to turn their means to the greatest advantage, have shown a laudable attention to their farm stocks. The breed of hogs, especially, which is preserved with great care, has a celebrity throughout the State. I have not been able to learn their origin; but incline to the opinion that they are a cross from the Chinese, with the English white Suffolk breed, of which some were imported to Philadelphia county many years since. They are white in color, of fine form, easily fattened, and of early maturity: at one year, without extra keep, they often weigh 300.

I obtained several females of the Chester breed, and found on the farm of an intelligent man in this county, a peculiar kind which I thought valuable—they were in shape like the Chinese, but larger in growth, of a red color, with occasional black spots. The owner told me he had first obtained them from the neighborhood of Westminster, Maryland, and that they were said to be of the Parkinson breed. I procured a boar of this kind, and adopting the recommendation of the celebrated Cline, crossed with the larger Chester breed.—This is the stock I have had, and they are much esteemed by all who have seen them. They fatten easy, at any age, and when fat will weigh at nine months 200, and at a year 300 and more. I had one which was kept until twenty-seven months old, the last three months being put up to fatten; he weighed 494 nett weight. I thought this cross an improvement in some respects, but the clear white of the Chester breed was more pleasing to the eye, and the breeders I now have, are chiefly of this kind.—Those I sent to you last season and this spring, embraced both varieties—the white being of the full Chester breed, or with a very small portion of the other blood.

I have seven or eight breeders, producing from eighty to one hundred pigs in the year, about one half I dispose of currently at five dollars the pair, and this pays the expense of keeping and fattening the whole. The common stock of this neighborhood does not command more than three dollars for the best pairs, and the demand for those I have would enable me to sell, at the above rate, many more than I can spare.

I have no distillery; my mode of feeding is, the first winter feed on boiled potatoes and pumpkins, with linseed oil meal occasionally; in the summer, keep them on the clover field, say from May to November; those intended for fattening, are then put up for four or five weeks, and fed upon corn; five bushels to each in the ear (but better if ground) will bring them to full condition for killing.

I have a cheap and useful boiling apparatus, the whole cost being not more than eight dollars; it is

simply a cast iron kettle, containing a barrel, put up like a hatter's kettle, with a small fire place below, and flues running up behind; a sheet iron lid covers the top, and a rough board shed is fixed about it to keep off the wind and rain. A boy in two hours may thus boil several barrels of pumpkins, and refuse potatoes or turnips, and the slop keeps moderately warm during two or three days, even in winter; a sprinkling of salt is necessary, and a few handfuls of corn meal will richly improve the mass. A piece of rotten wood, or a shovel of coals from the bake oven-pit, occasionally thrown into the pens, is necessary as a luxury, and I suppose a useful absorbent.

The praises of the *poor man's cow* we often hear, but the poor man's pig I deem of really greater value. The cow, it is true, yields his family a luxury during nine months in the year, but at an expence not less than twenty-five dollars. A pair of pigs, of a good breed, the cost of which with keep and fattening will not exceed fifteen dollars, furnishes his family with five hundred pounds of meat, sufficient for his year's consumption.

Among the agricultural improvements of the day, some attention has been excited to the breed of hogs, and the mischievous notion long prevailing, that *feed makes the breed*, is going by. A valuable article was published some time ago in your paper on this subject, from the pen of your late lamented correspondent, Mr. Meade, containing many excellent hints. The loss of this useful citizen to the agricultural community, would seem to make it incumbent upon others, to contribute occasional suggestions, which their practice or information may furnish, to further our common cause; and in the hope that the example may draw upon the leisure hours of some to follow me, I have extended my sketch to a more tedious detail than I at first intended. C. A. BARNITZ.

Springdale, York, Pa. Aug. 31, 1833.

MOWING WHEAT.

A WRITER for the Maine Farmer, with the signature "*A young Farmer*," assigns several reasons in favor of mowing wheat with a scythe in the same manner that grass is mown, and gathering it with a rake. "In reaping," he says, "there are many heads cut off so short, that they are never bound; and there is some waste in binding. Where I have mowed it one way and raked the other, there is hardly a straw to be seen."

Cradling grain he likewise condemns as wasteful. Mowing, he says, saves three fourths of the time in a busy season—gives a greater quantity of straw—prevents the scythe being dulled the succeeding year by stubble, and furnishes more straw for fodder and manure.

With regard to threshing the writer says, "I know full well that I cannot thrash as much grain when mowed as when reaped. As near as I can judge from what experience I have had, the difference is about one quarter; i. e. to thrash the mowed grain costs a quarter more labor. Now let us strike the balance, in order to find how the account stands. By mowing, according to my estimate, we save three fourths of our time; by thrashing we lose one fourth of it. But still we have half left, i. e. 2 days in 4. Is this of any consequence in this busy season? Now how does the account stand?"

"As our cattle demand so much of our time at the barn in the winter, what can we do better, while we are thus enjoying the pleasure of feeding

and seeing them eat, than to be getting out our grain, and having the straw ready for its various uses: furthermore, what is a day's work at that time of the year compared with one in harvest? In making these observations it is expected I shall be understood to have a suitable bottom to mow; and grain that is extremely stout, so as to lodge, may be expected. The difference of the value of labor between the two seasons (grain harvest and winter) alone, is almost a turning key to the question. I can procure three days' work easier at the last mentioned season than one at the first. In giving these views to the public, I am conscious that I shall find very little support, perhaps be contradicted: if I should be, I shall not be wounded in my feelings, but hope to learn something that shall be of use to me in husbandry hereafter."

BEES.

THE method of keeping bees in rooms or garrets prepared for them is a great improvement. These rooms should be so tight that rats, mice, and other vermin cannot get to them; and they should be dark, for if there is a window the bees fly to that instead of going to the apertures made for them to pass in and out. Bees managed in this manner never swarm, and you may take from them such quantities of honey as you like.—*Maine Farmer*.

BEE HOUSE.

WE have seen a bee house, the method of constructing which was introduced into our country by Mr. Eber Wilcox of Salem, and which is said to be a very valuable improvement. Several individuals have tried it with entire success. It consists of a house of brick or wood, (if wood standing on stakes,) say of the size of a common smoke-house, with a door to admit of the entrance of a man. The inside is merely furnished with shelves like an ordinary pantry. The bees pass in and out through several apertures resembling spouts, arranged in rows on each side. These spouts project six inches, and the hole is perhaps two or three inches wide by from one eighth to one half an inch in height. The benefits of the method are said to be these: the bees never swarm, but continue filling up the house; the honey may be easily taken out, when the bees retire to the bottom of the combs in cold weather; and it is said to be an infallible preventive to the worms, and the light fingers of the night gentry.—*Cortland Advocate*.

SICKLE PEARS.

WE had occasion on Saturday to visit the farms belonging to the Girard estate on the Neck, and on one, now in the occupancy of Mr. Ash, and be it said, well cultivated, we found a pear tree loaded with that delicious fruit, known in our market as the "Sickle Pear." This tree is the *parent stock*, as we learn, from which all the Sickle Pear trees in the country have come. We could not learn the origin of the tree, and indeed so many vague stories are told, that it would be difficult to find out whence it came.—*U. S. Gazette*.

RHUBARB.

DR. STEBBINS, the queerest genius in all our town for gathering up the odds and ends of vegetable and animal curiosities, has at his office in the Court House, a leaf of the Rhubarb plant which measures thirty inches long and is twenty eight inches wide.—*Northampton Courier*.

From the *Detroit Journal*.
FRUIT.

THE great celebrity which our territory sustains for excellence in the quality of its cider, has not resulted so much from any superior skill or care in its manufacture, as from the quality of our apples. It is evident that the ancestors of the present race of French inhabitants, when they emigrated from France, took unusual care to select the best kinds of apples. Normandy has been celebrated for apples, and those of this country are said to have been imported from that province. It is evident, that, whatever may have been the improvement in agriculture since the original settlement of this country, it has not been manifested by any increased care and attention to the culture of fruit trees. Though the orchards in this neighborhood have been in existence, near a century, and have had little attention paid to their pruning and dressing, they still maintain their superiority for cider. This is conclusive evidence of the adaptation of our climate to fruit; but with the exception of apples, we have very few varieties. With respect to cherries, we have none but the common small, red kind, and they are nearly run out; and there are very few good varieties of peaches, plums, or pears. In the interior the early settlers have not generally been so provident as to plant our orchards, though the approach to the country having been by water, was calculated to facilitate the introduction of fruit. As so desirable a luxury is so easily attained, we think it almost inexcusable to neglect it. In the whole scope of farming operations, there is nothing which better repays the care and culture bestowed upon it than fruit. And those who addict themselves to it, and acquire any tolerable degree of skill in the management of fruit, find sufficient delight in it to repay their trouble, even if the profit were not sufficient. The mode of training trees in the *espalier* form, or on walls, we believe, has not been practised here. As a substitute for walls, a strong board fence will answer to train to. The superior quality and flavor of fruit cultivated in this way, will well repay the trouble; and beside this, by attention to pruning, a crop of fruit may be insured every year, whereas without that attention, trees rarely bear oftener than every other year. Trees in this way may be trained to any form; in gardens, dwarf trees may be planted along walks, and are preferable to standards from occupying less space, and can be trained so that the fruit can be picked off with ease by hand. The common wild crab affords an excellent stock to graft dwarf trees on, both on account of the smallness of its size, and its hardness; but it is not material, for the tree is trained to the dwarf form by cutting or heading down, and any kind will answer. In training on a wall or board fence, the tree, after one year's growth from setting out, is cut down to three or four eyes, say a foot or eighteen inches from the ground, as the shoots put out those that are foreright or front as well as rear, are pinched off with the fingers, while those shoots which grow in a position suitable for training are nailed with strips of cloth to the wall or fence, in this way they are usually trained, in the form of a fan; but the form may be varied to suit the place where they are to grow. Trees should be pruned every year, in order that the useless or superabundant wood may not draw off the sap which is necessary to supply those shoots that produce fruit. The fruit is borne on shoots of a for-

mer year, and those which will bear fruit may be distinguished by their buds. After bearing three or four years, they become exhausted, when they should be cut down to two eyes, in order to produce new wood. This mode of cutting out the useless wood and producing an alternate growth of new wood, preserves the tree in a constantly healthy and bearing state, and the fruit is, consequently, fairer and finer.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 25, 1833.

HORTICULTURAL FESTIVAL.

THE fifth Anniversary of the Massachusetts Horticultural Society was celebrated on the 13th inst. At 11 o'clock, an excellent Address was delivered at the Masonic Temple, by Hon. ALEXANDER EVERETT. This contained brief but comprehensive historical sketches of Horticulture, and notices of existing improvements in gardening, as displayed in various parts of Europe, and noted by the personal observations of the Orator. A portion of the Address had reference to Cemeteries, in different portions of the globe, and particularly that at Mt. Auburn, which was originated and established under the auspices of the M. H. Society. This part of the performance was particularly interesting, eloquent and impressive. From half past 12 to 2 o'clock, the Dinner hall was open to public inspection, and notwithstanding the rain, which fell profusely, a large concourse of spectators proved that the public felt an interest in the exhibition.

At three o'clock the Members of the Society, together with numbers of respectable guests, sat down to a dinner provided by Mr. Eaton, which consisted of all the substantial and delicacies the Epicure could wish for, or the Temperate Man enjoy. The following are some of the donations of Fruits and Flowers, which were presented for the festival.

A fine basket of Isabella grapes, &c. from E. P. Hartshorn, of Boston,—also a basket of Black Hamburg and Sweet Water grapes, from the same—open culture, fine for the season. A basket of apples, and a basket of Seedling pears, from Joseph Morton, Esq. of Milton. Freestone Rare-ripe peaches, a very handsome specimen, from E. Cowing, of Roxbury. From John Prince, Esq. of Roxbury, a basket of Ruckman's Pearmain, a basket of Gilliflower apples, a basket of Bourasseau apples, a basket of Pomme Nieve apples, a basket of Summer Queen apples, a basket of Ribstone pippin, Fall Queening apple, Golden Pippin, French apple, French Bon Chretien pear, all very beautiful. From E. M. Richards, of Dedham, two baskets of natural peaches, superior, two baskets of Benoni apples, large, one basket of Red Juniating. From Madam Dix, Boston, a basket of Dix pears, very fine. From Dr. S. A. Shurtleff, Boston, a basket of St Michael pears, and 4 baskets of White Chasselas grapes, open culture, very beautiful. From Luther Allen, of Sterling, 3 baskets of monstrous Red apples, for baking.—From J. Tidd, Esq. of Roxbury, 4 clusters of very fine Black Hamburg grapes, also a large Muskmelon. From Charles Oakley, Esq. of the City of New York, a basket of Heath Clingstone peaches, a basket of plums, name unknown, a basket of Orange Nectarin Clingstone seedlings, a basket of Orange Clingstone seedlings, a basket of seedling pears, a basket of pears, called Vergalieu in New

York, the St Michael in New England, a basket of peaches, name unknown, all beautiful and some splendid specimens. From Enoch Bartlett, Esq. Roxbury, a basket of Bartlett pears, a basket of Andrews pears, a basket of Capiaumont pears, all very superior. From John Wilson, of Roxbury, 2 baskets of Melacaton peaches. From E. Vose, Esq. of Dorchester, a basket of Capiaumont pears, a basket of Bartlett pears, very superior. From John Breed, Esq. of Belle Isle, 2 baskets of wall fruit peaches, one basket of Bartlett pears, one basket of pears, name unknown, a basket of long green pears, a basket of pears, name unknown, all very fine fruit. From Howland Cowing, Roxbury, a basket of large sweet apples, name unknown, and one do. of sour. From Dr. Webster, of Cambridge, a variety of Flowers, also a vegetable called Glascol Rabbi, a basket of almonds, open culture, a basket of white Chasselas and red Chasselas grapes, a Persian and one other variety of melon, very fine. From P. B. Hovey, and Charles M. Hovey, of Cambridgeport, one highly decorated basket, containing Bartlett, Johonnot and Andrews pears, and several varieties of peaches, grapes, and Flowers, also another basket of Bartlett and Johonnot pears, and a basket of Porter apples, very fine specimens. From Messrs. Winship, of Brighton, 2 baskets of Semiana plums, very superior. From E. P. Hartshorn, eight baskets containing Isabella, black Hamburg, and white Chasselas grapes. From Messrs Willet and Wilson, of Boston, one large basket of Autumn Bergamot, also a large basket of Gansels or Brocas Bergamot pears, also a large basket of white sweet water grapes. From Professor Farrar, of Cambridge, a fine basket of Porter apples. From E. Breed, Esq. of Charlestown, two large decorated baskets, consisting of the white Muscat of Alexandria, the St Peters and black Hamburg grapes, Bartlett and Roussellet de Rheims pears, and a variety of peaches, very beautiful specimens. From Lawson Buckminster, Esq. of Framingham, one large basket of Porter apples, very superb. From Mr. Mason, of Charlestown, a basket of green Citron melons, 3 baskets, containing Malta peaches and Nectarines, 4 baskets of black Hamburg grapes, and one of Miller's Burgundy grapes, also yellow Muskmelons, very fine specimens. From Joshua Childs, Boston, a basket of Manilla grapes, a beautiful specimen. From the garden of the late Redford Webster, Boston, a basket of St Michael's pears, a basket of sweet water grapes, and one of sweet lemons. From David Fosdick, Charlestown, a very beautiful ornamented pyramid basket of white Muscadine and Isabella grapes, and a variety of apples and peaches. From Enoch Bartlett, Esq. Roxbury, two baskets of beautiful peaches, and a splendid specimen of Porter apples. From Zebedee Cook, jr. Esq. of Boston, 1st Vice President of the Society, a basket of most beautiful Bartlett pears. From Dr. Fisk, of Worcester, a basket containing very large varieties of apples. From Wm. B. Roberts, Gardener to Samuel G. Perkins, Esq. of Brookline, a large and highly ornamented basket, containing black Hamburg, Cape, St Peters, Linfendal, white Muscat of Alexander, Golden Chasselas, common do. grapes, Admirable, Jaune, Bolle Chevereuse, Morris's white early Admirable, Pine apple, Clingstones. From Hon. H. A. S. Dearborn, President of the Mass. Hor. Soc., Roxbury, two baskets of red Roman Nectarines, one do. containing Drap d'Or, and late blue French plums, one do. Cantaloupe

Melons, Trowbridge apples, Maria Louisa pears, Beurre Angletterre do., Sickle do., some of them very beautiful. From Jairus Lincoln, Hingham, a basket of Seek-no-further apples. From Elisha Edwards, Springfield, a basket of Freestone and Clingstone peaches, very fine, one do. of St Michael's and brown Beurre pears, large and fair. From Wm. Lawrence, Bulfinch street, Boston, Seedling penches, very beautiful. From T. B. Coolidge, Esq. Bowdoin Square, Boston, a basket of beautiful yellow plums. From the garden of the Hon. T. H. Perkins, by W. H. Cowing, white Hambro-Muscat of Lunel Frankendale, Royal Muscat of Alexandria, flame colored Tokay, black Frontignac, Melacaton (native), white peaches from the wall, Bromfield Nectarine, American, all remarkably fine specimens, and some uncommonly splendid.

The Floral Decorations of the Hall, (which did great credit to the taste of the Committee, who performed that service), were furnished from the Society's Garden at Mount Auburn by Mr. D. Haggerston, by Messrs. Winship, Mr. Mason, Mr. Walker, Mr. P. B. Hovey, jr., Mr. C. M. Hovey, Messrs. Kenrick, Dr. Webster, Henry Sheafe, Esq. and others. Gen. Sumner, furnished some fine purple Egg Plants for the Dinner.

Eleven varieties, consisting of Apples, Pears, Peaches, Plums, and Lemons of Artificial Fruits, very nearly resembling natural ones, were exhibited by Mr. Nelson D. Jones, No. 21 Joy's Buildings, where the Society and others can see artificial specimens of the finest fruits.

A large Orange Tree, in full bearing, exhibited by Messrs. Willot and Wilson, attracted much attention. By order of the Committee on Fruits, &c.

EDWARD M. RICHARDS.

Nicholas Longworth, Esq. of Cincinnati, Ohio, an Honorary Member of the Society, sent two bottles of native wine, the pure juice of the native grape, which was very much admired, and was of excellent quality.

After dinner the following regular Toasts were drank.

Cultivators and Conquerors. The former would make the whole world a Garden, the latter would convert the "Great Globe" to a Golgotha.

Let the Trumpet of Fame
Resound with the name
And deeds of the Tiller,
But blast the Mankiller.

Manual Labor Schools. Success to those literary and scientific establishments, which, by mixing corporeal with intellectual exertions, set the seal on that true greatness, which consists of a union of the most estimable qualities of Body and Mind.

Nullification. A Passion flower, planted in a hot house, propagated by artificial heat, and matured by fermenting substances. Let us hope that the process of division may not change it into a "Tremella noster," or the "fallen Star."

Office seekers for Office sake. Parasitic plants, Creepers into party, Climbers into popularity, and Twiners into power; a Tribe, sometimes very ornamental to the people, always useful—TO THEMSELVES.

The Veterans of '76. A few slips of the Elder, grafted on the tree of Liberty. Their upright shoots, did not need much training, to produce a collection of SCARLET RUNNERS.

Ireland, the land of the Potato. The Root is finely formed by Nature, but does not thrive by being forced. If an Irishman is not allowed to eat his Potatoes in peace at home, is it a wonder if he is not mealy mouthed abroad?

The Promotion of Patriotism. If we wish our citizens to love their country, we must make our country lovely by manual, mental and moral cultivation.

The Michael and Imperial Pear of Portugal. Both called Royal, but as Good Christians, we declare that they are neither of them worth half a crown.

The Gardener. His wealth will be found to lie in his bed, provided he does not lie there too long himself.

Gold Mines. With a spade, a hoe, and active industry, every cultivator will find one in his kitchen garden.

The Tree of American Liberty. An union of twenty-four branches, supported by one trunk. It is more than half a century old—and each succeeding year extends its foliage and deepens its roots.

Public Education. A tree of knowledge; its opening and expanding blossoms are budding beneath the genial sunshine of popular patronage. Its supporters will reap the Fruits of an approving conscience, that 'blesses the giver more than the receiver.'

Women, sweet herbs. In the summer of our existence, aromatic as the Rosemary; in the autumn, grateful as the Lavender; in the winter, balsamic as the Sage—May the seasoning of domestic life never be mixed with the sauce.

VOLUNTEERS.

By H. A. S. Dearborn, Pres. of the Mass. Hort. Society. The Orator of the Day—May we cultivate the fruits and flowers of our gardens with as much zeal and success, as he has those of literature and eloquence.

By the Hon. A. H. Everett, Orator of the Day. The Horticultural Societies of Massachusetts and her sister states. We cannot wish them better fortune, than that their success should be equal to the excellencies of their desserts.

By Judge Story. The Massachusetts Horticultural Society: Its native stock excellent, its foreign grafts full of rich fruits, and its set-off of flowers beautiful.

By the Hon. Ebenezer Mosely, President of the Newburyport Horticultural Society; present by invitation of the Massachusetts Horticultural Society. **Education:** That moral culture which eradicates the weeds of bad principles, swells the bud, unfolds the blossom, and ripens the fruit of science and good morals.

Sent by the Hon. T. H. Perkins, with a contribution of beautiful fruit. May our Domestic, as well as our Horticultural Nurseries, produce fruit which well deserves cultivation.

By E. Bailey. "Office-seekers for the sake of office,"—borers who would destroy the tree of Liberty.

By Grant Thorburn, of New York. Bachelors: Those sleepy Adams in the American gardens—May they awake like their grandfather—see Genesis 2d chap. from the 21st to the 25 verse.

The Original Laurie Todd. The Veteran Horticulturist and Seedsman, that commenced his career, with two Geraniums, in green painted pots.

By Charles Oakley, Esq. of New York, sent with a box of valuable Fruits. The Friends of Horticulture and the Practical Gardeners of the East. May they ever be prospered, not forgetting their associates in other Climes.

By Elisha Edwards, Esq. of Springfield, sent with a large contribution of valuable Fruits.

Agriculture, Horticulture and Floriculture, subject to the improving taste and industry of man—May their march be onward till the whole earth shall become fruitful fields and gardens, and man shall return to his native innocence.

By H. J. Finn. Miss Fanny Kemble—A rare and splendid specimen of the Star Apple. Can we wonder at the splendid success of such a scion, springing from such a talented Stock.

By the Hon. Mr. Gouldsbrough, of Maryland. The refined and hospitable Inhabitants of Boston—May they long, very long, enjoy their beautiful and various Flowers, and their repast of delicious fruits in the lap of peace, and under the protection of the Federal Union.

By Mr. G. H. Andrews. Fruits and Flowers. Grateful to the taste and to the sight—May their buds and blossoms never be blighted by the chill of ingratitude towards the giver of them.

By B. V. French. The New England Farmer and Horticultural Journal. May its influence continue with the Agricultural and Horticultural community of New England, till we can boast of a Sinclair, a Davy, a Knight, and a Loudon of our own.

By T. G. Fessenden. The best antidotes to Intemperance: Domestic endearments, a taste for good Fruit, and a fondness for fine Flowers.

By David Haggerston. America and Great Britain: In the interchange of productions between the two countries, may the Olive Branch ever be the article most highly estimated.

By George C. Barrett. The Fruits of this day's Exhibition. If the forbidden Fruit was equal to this, Madam Eve would scarcely need an apology for yielding to the temptation which it presented.

By a Guest from Nantucket. The Sea and the Land. Their products equally benefitted by emulation, and alike augmented by encouragement: May those, who plough—either, reap a rich harvest, and their stores abound in "Corn, wine and oil."

By E. M. Richards. The 9th Congressional District. May it be represented with as much integrity, ability, and eloquence in the next Congress as in the last.

By a Guest. Good Taste, the result of cultivation both in mind and matter. We here taste the good fruits produced by good taste.

By B. V. French. Judge Buel, of Albany. The Patron and Pattern of Agriculture and Horticulture. His Practice is Scientific, and his Science is Practical.

By G. C. Barrett. Hon. J. Lowell. The Promoter and Benefactor of the great interests of Agriculture and Horticulture.

The President having retired, Zebedee Cook, Jr. Esq. the 1st Vice President, after remarking on the services rendered to the Society by Gen. Dearborn, concluded with a sentiment, expressive of the high and grateful sense he entertained of the President's talents, untiring zeal and devotion to the interests of the association, which met with a cordial response from all present.

Many other nuts of wit and wisdom were cracked with as much glee as if Comus himself had presided at the feast, and every guest had been inspired by the Genius of Hilarity, Quips, quirks, smiles, plain and wreathed, and other manifestations of mirth from the delicate inaudible simper to the loud horselaugh, indicated that all believed, "a merry heart doth good like a medicine." A Song written and sung by H. J. FINN, Esq. [see the last page of this day's paper] added much to enjoyments of the feast of intellect and the flow of festivity.

We are happy to learn that an Address will be delivered before the Massachusetts Agricultural Society at their Exhibition at BRIGHTON on the 16th Oct. by Hon. EDWARD EVERETT.

ERRATA.

MR. EDITOR, A few errata in my communications, either of the copy or of the printer, require correction.

In No. III. Mr. Pomroy is represented as having sowed about one bushel of wheat to an acre; it should be one and a half bushel. His rule is to sow one bushel of rye and one and a half of wheat.

In No. IV. p. 66, line 30, for Mr. Arms read Mr. A. Wells.

Lines 50, 52, for store read Stow.

Sept. 16.

H. C.

WANTED.

IN the vicinity of Boston, an experienced Gardener, thoroughly acquainted with the propagation and care of Green House Plants, and the management of Vineries, to whom the highest wages will be paid—satisfactory information, as to capacity and character, will be required. Apply at this office. sept25

GREEN HOUSE GLASS.

LORING, & KUPFER, No. 10 Merchants Row, have on hand a very large supply of thick Glass suitable for Green Houses and Factories. Also Plate Glass of a superior quality and thickness, with other descriptions of Window Glass, all Sizes, in large or small quantities, at the lowest prices. 1m sept18

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. Merino, a very superior article, and all the most desirable colors, imported expressly for the subscriber—4 cases 3-4 Eng. do. of various colors and qualities—4 cases Circassians, very superior qualities and various colors—1 case superior Goats Hair Camblet—4 bales 4-4 5-4 and 6-4 Bocking, green and mixed—12 bales splendid Tarriffville Hearth rugs—5 bales Eng. low priced do. do.—54 bales Domets, white, yellow, red, &c.—10 bales Flannels, Eng. Welsh, and American—10 bales Cotton Carpeting, striped and blocked—6 bales Russia Diaper—1 bale Canton Flannel, lower than the cost of importation—3 bales American Cotton Flannels, bleached and unbleached—1 bale White Counterpanes, all sizes—10 bales superior London Row Blankets from 10-4 to 14-4—7 bales real Indigo Checks from 3-4 to 5-4—3 bales American Gingham—2 cases Eng. Gingham—29 bales cotton Batting—25 bales Pillisse Wadding, 12 bales black Wadding—5 cases Embossed Furniture Dimety—2 cases Embossed Cambric, for stage lining—20 cases Prints, all patterns and prices, Eng. MASSACHUSETTS HORTICULTURAL SOCIETY.

AN Adjourned Meeting of this Society will be held at their hall, on SATURDAY next, at 11 o'clock.

R. T. PAINE, SECRETARY.

REAL ESTATE FOR SALE.

THE subscriber offers for sale his valuable Real Estate in the town of Palmelia, on the Black River, opposite the village of Watertown, in the county of Jefferson, state of New-York, consisting of a Saw Mill, Flouring Mill, with four run of Burr Stones in good orders, Machine Shop and Distillery, and is one of the best hydraulic privileges in the State.

Also, six small Dwelling Houses, with suitable out-houses.

Also, one large two story DWELLING HOUSE, with a barn and all other out-houses attached to it that are necessary, with a garden extending to the banks of the river.

Also, about three hundred acres of first rate Land, lying over one mile on the river and road leading from Watertown to Brownville; about one half is under cultivation, and the remainder is good wood land.

The above property will be sold at auction, on the first day of October next, (unless sooner sold at private sale,) in such parts as may suit purchasers. Two-thirds of the purchase money may remain two or three years on bonds and mortgages. Those who wish to make good bargains would do well to call and examine the premises. Any information that may be wanted can be had by applying to the subscriber, in Watertown. J. FOSTER. Jy 24

VALUABLE FARM AT AUCTION OR PRIVATE SALE.

THE Subscriber offers for sale a Farm situated in the town of Marlboro', Mass. about half way between Howes' Tavern and the Lower Meeting-House. It consists of 140 acres of excellent land, with a large two-story Dwelling House, two Barns, Chaise and other Out-houses, with two fine Wells of Water. About 70 acres of the land is covered with a fine growth of the best quality of Wood; the remainder, consisting of Mowing Lands, Tillage and Orchard, is in a high state of cultivation. It now supports 20 head of horned cattle, horses, swine, &c.

For the last 25 years, this estate has been improved by Mr. William Wilson, deceased, and for 50 years previous thereto, it was known as "Munroe's Tavern." The excellent quality of its soil, the large and valuable quantity of wood, and its other numerous advantages, make it a most desirable situation for a farmer; while its situation (on the old road to Worcester, on which the travel is great, the distance from any other tavern and its former notoriety as one), makes it a no less desirable situation for a Tavern again.

The above estate, free from all incumbrances whatever, will be sold on Friday the first day of November, unless previously disposed of by private sale. As also, at the same time, all the cattle, a large quantity of hay and grain, farming utensils, &c. as are not previously disposed of.

Terms of purchase made known on the day of sale. Likewise, several other lots of land belonging to the same estate, will be sold at the same time.

JOSIAH WILSON, Administrator.

For further information, apply to WEBBER WILSON, on the premises, or to Messrs. LOT WHEELWRIGHT & SON, No. 46 Central Wharf. sep 11

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sept 11 eow6w

CLOVER SEED.

4000 lbs. Northern Clover Seed, 500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

GRASS SEEDS, (for fall sowing.)

FOR sale at the New England Seed Store, 51 and 52 North Market Street.

Clover, (Northern)—Herds Grass—Red Top—White Clover (fine imported)—Lucerne, &c. &c.—Wholesale and Retail.

Cows and Calves. We noticed sales at \$20, 23, 25, and \$27 50.

Sheep.—We noticed a lot taken at \$1 42, 1 50, 1 62, 1 67, 1 88, 2 00, and 2 25. Wethers at \$2 25, 2 50, and 2 75.

Swine.—One lot of about 100 taken at 4c. and a lot of 70 at the same. A lot of 60 at 4 1/2c. and two lots of 50 at 4 1/2c. An entire lot of 200 at 3 1/2c. and a small premium; at retail, 4 1/2 a 5c. for Sows, and 5 1/2 a 6c. for Barrows.

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug 23

MISCELLANY.

The following Festive Effusion was written and sung by H. J. FINE, Esq. at the Horticultural Exhibition.

LOVES OF BETSEY BUCKWHEAT AND SIMON SPARROWGRASS.

WHEN Dr. Darwin ruled the taste of folks with rod despotic,
He sung the loves of all the plants, both native and exotic;
I mean to say he thought he did, but he forgot, alas!
The loves of Betsey Buckwheat, and one Simon Sparrowgrass.

A culinary maid was she, and he a man herbaceous.
"Oh! lauk a daisy" he exclaimed, and she "my goody gracious."

He took his bread and cheese with her, also a little shrub,
And after killing *Caterpillars*, swallowed down his *Grub*.

This Simon he was very thin, though thick with Bet, by gosh,
For he was like a Parsnip long, and she a Summer Squash;
He called her his sweet sugar *Pea*—dwarf marrowfat I ween—
For love had in his head and heart—his *poll* and *kidney-been*.

His jacket sowed in patches, wasn't worth a single shilling,
His pantaloons were full of holes—of course were made of drilling;

She thought he looked like *scurvy grass*, and it was most distressing,
Said she "you know I think a *Goose*, is nothing without dressing."

His love was deeply rooted—so he thought he'd stir his *stumps*,
And as his mouth did water, why, he bought a pair of *pumps*:
A reddish coat he got cut out, with *turn-up* collar juttings,
And so love apples he did mean to propagate by cuttings.

Her peepers were *Black Hamburgs*, and she sharpened all his *rights*;

When Cupid plants his round and *grape*, they're shoots from female eyes.

While Simon was a *raking*, little Cupid often laughed,
To think how Betty Buckwheat soon, would *rake* him fore and aft.

He vowed to pop the question, and one Sunday night they met,
And there they shared the loaves and fish—a *kitchen cabinet*.
He thought he'd like a stock of Simons, from a little *tallow tree*,
And raise some little *suckers*, from a little *nursery*.

"Oh! Betty Buckwheat," then said he, "if you and I don't wed;
"I shall return from whence I came—that's to a *parsley bed*;
"Them 'ere horse pistols what you see, shall visit these 'ere lugs."

Then slow as any *snail* he went, to choose a brace of *slugs*.

"Oh Sparrowgrass! O Sparrowgrass!! O Sparrowgrass!!!"
said she,

"I can't resist—I'm all your own—it's my *fat-ality*."
But Simon thought, the fingers of her fist were so immense,
'Twould take ten dollars to enclose one, in a *gold-ring fence*.

As calms succeed a storm sometimes, so storms succeed a calm;
And weeks of *wormwood*, followed Simon's honey-moon of balm;

For brandy blossoms, soon were seen, upon her bottle-nose;
And *bulbs* they budded on his head, for there she planted *blows*.

The forcing system she pursued, was, from the house to scold him;

It proved a *hot house*, for she made his house too hot to hold him.

For Betsey planted lots of *Box* around his cranium's ledge,
And though he did dislike the *Bet*, it was too late to *hedge*.

His Waspish Bee he then found out, was but a mere *humbug*,
For daily to her jugular, she joined another jug.

Her hands would gather in his *crop*—for she would tear his hair;

And the nature of the *Crab*, was grafted, on this kitchen pair.

To make an end of Sparrowgrass, she swore, from the beginning;

She starved him, though his long lean limbs, did never need much *thinning*;

One day she knocked him down, and ran, in spite of all his prayer;

She was an *Offset* out of doors—he on the ground a *layer*.

So he fell sick, to think no junior Sparrowgrass should be;
A little *heir* he thought to feel—a *Son-flower* to see.
The Faculty could not restore his faculties to try 'em;
It is not strange that soon he died—he physic took per diem.

His plaguy Toad in our Frog pond, then drowned herself one night;

But as all liquors from the Common, now are banished quite—
Each 'lection day her ghost appears, and laughs to think—of rot her—

That she's the only *Spirit* there, allowed to mix with *Water*.

MEDICINES.

Why is it that men are so ready to leave the plain paths of science and philosophy, and wander in the mazes of mystery and uncertainty in a matter so important as health? The difficulty lies in a vain attempt to search out something by which they can obviate the evils arising from the improper gratification of their appetites and passions,—and there is a goodly number of the latter class who never stagger,—after having been in the indulgence of a depraved appetite for five, ten, twenty, and perhaps forty years, by which the digestive organs are deranged, and the constitution impaired, expect that a box of Hygean Pills, or some other medicine taken off hand, will build up, in a few days, what they have for years been pulling down, and thus refit them for the renewed acts of drunkenness and surfeiting. Here lies the mistake;—for what can be done for that man whose own acts of intemperance in eating and drinking have destroyed and worn out his powers of life, which, when medical art and knowledge has left them free to act, refuse to do their office? Will any of the popular medicines, or Hygean Pills do this? No. Then it is there is no redemption, and death closes the scene. Let not then, that man who rises early to visit the dram shop, or he who more modestly waits till eleven o'clock before he begins to stimulate his system with ardent spirit or wine; neither let that man—however temperate he may be in relation to ardent spirit—who can compromise with his vitiated appetite with nothing less than *hot bread* and *butter*, *beef steak* with its usual condiments, pickles, &c. for his dinner; all kinds of what is generally denominated *good cake* and *pie* for his supper; with *nuts*, *almonds*, *figs*, *raisins* and *apples* during the evening,—and this last dose he is almost sure to get into him with the rest if he goes into a *fashionable party*;—neither let that female who takes her full portion of such *good things* in connexion with often and repeated draughts of those weakening and diluting liquors, tea and coffee, and whose only exercise is running up and down stairs a few times a day, with a little drumming upon the piano-forte, while the lungs have not more than three-fourths of their natural room for the purpose of respiration, when restless nights come on, and disturbed sleep, palpitation of the heart, with all that long train of female complaints which are connected with a debilitated state of the body. In a word, let no one who commits any acts of excess or intemperance think, that for all ill health arising from such causes, Hygean Pills will prove an immediate and sovereign remedy. The cause is intemperance, the cure must be in temperance!—By the former they lost their health, by the latter they must regain it, if they have not gone too far, and are doomed to suffer the consequences of their own folly and wickedness.—*Newburyport Herald*.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus MULTICAULIS* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Peonies*, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

IMPROVED DURHAM SHORT HORNED CATTLE.

BOSTON, WEDNESDAY EVENING, OCTOBER 2, 1833.

NO. 12.

MASS. HORTICULTURAL SOCIETY.

THE Annual meeting of the Massachusetts Horticultural Society was held on Saturday, Sept. 2, 1833.

Letters from J. C. Gray, Esq. and R. L. Emmons, declining to be considered as candidates for office, were read. The Garden and Cemetery Committee made the following report, which was read and accepted.

The Garden and Cemetery Committee of the Massachusetts Horticultural Society have the satisfaction of reporting, that in pursuance of the authority granted them by the Society, at their former meeting, they have made several purchases of land adjoining Mount Auburn, and making the whole quantity in the Garden and Cemetery one hundred and ten acres.

The Committee have designated as and for the Cemetery, all the land lying south of the northern junction of Maple and Elm Avenues, of Garden Ponds, and of the junction of Primrose Path with Central Avenue, lying west of Central Avenue, which they hope will meet the approbation of the Society; the residue of the land is appropriated to an experimental Garden.

They have laid out about four hundred cemetery lots, and have sold two hundred and fifty-nine lots of different dimensions, which with the premiums paid for choice, amount to the sum of

The loan that the Committee were authorized to make, was subscribed by individuals who are Proprietors of Lots and amounts to

Total funds, available,
The Committee have paid for the land, in cash,
For house for the Gardener and for implements and expenses relative to the Garden,
For fence, gate, avenues, tombs, and other expenses of various kinds,

For Gardener's salary, 3 months,
Horse and cart for garden

There is due to Mr. Cutter, David Stone, and the heirs of C. Stone, for land purchased of them, payable at future periods,
And sundry bills outstanding, for work, for the payment of which, however, funds are provided, as appears by the Treasurer's statement herewith submitted.

The Committee have caused the whole estate to be surrounded by a fence, as substantial as the present means at their disposal would permit, but they hope it may be replaced hereafter with one of more permanent materials—and have erected a gate of classical form, with lodges for a porter and other purposes. They have erected a cottage for the gardener, have made about four miles of avenues and paths, and have constructed a receiving tomb at Mount Auburn, and purchased another

under Park-street Church, and have done considerable work in and about the garden and ponds.

The present situation and prospects of this interesting institution are highly flattering.

For eighteen months and upwards, free access was given to all who wished to visit the Garden and Cemetery, either on foot, or horseback, or in carriages—but it was found that great abuses were practised there, and the Committee deemed it essential to the prosperity of the institution that some check should be put to them, for many persons who had purchased lots, complained that the Cemetery was used in a manner very different from what they had expected, destroying the solemnity and quiet which ought to prevail in a place of repose for the dead; and others stated that they had intended to purchase lots, but should not do so, if such indiscriminate admission were given to visitors,—by some of whom trees were mutilated, fences round the lots broken, and the lots themselves trampled on. The Committee then adopted the regulation of denying admission to persons on horseback altogether,—of admitting the proprietors of lots in carriages, and of opening the gate to persons on foot freely, as before. With but few exceptions, this regulation has met with approbation, and the effects have been very salutary; in a pecuniary view it has been useful also, (though this was no part of the design of the Committee in establishing it,) for many persons have become purchasers of lots, and others are known to be ready to purchase, for the sake of enjoying the privilege of entering the grounds with a vehicle; the committee are of opinion that from \$1200 to \$1500 worth of lots have been disposed of in this way; and as the Committee have no interest other than (in common with all other members of the Society) the desire of beautifying and improving the Garden and Cemetery, they hope that the regulation they have adopted will meet the approbation of the Society.

The number of interments is forty.

There are many objects of improvement for which the Committee hope that funds may be obtained—and among the first, for the erection of a small edifice, in which religious services at funerals may be performed. This is very much wanted, and it is to be hoped that such a building may soon be erected there. All which is respectfully submitted.

JOSEPH STORY, Chairman.

The Treasurer of the Cemetery made the following report, which was read and accepted.

The Treasurer begs leave to report the following statement to the Committee, from his Books, to wit:

Amount of sales of lots, including \$1314 02 rec'd for premium for right of selection, \$17291 72
Amount of loan made 1 Jan. and subject to interest, - - - 4400 00
Rent of Meadow, - - - 3 00
Notes Payable, signed by the Pres't of the Hor. Soc. and payable to Stone and others, for land, and subject to interest, 2600 00
Balance due to D. Stone, guardian, for land, - - - 103 44

\$24398 16

Payments made by, and debts due to the Committee.

For Land, in cash 7413 44, notes 2600, \$10013 44
For House for Gardener, and expenses pertaining exclusively to the Garden, 2420 09
For Improvements in Garden and Cemetery, - - - 8218 12
For Tomb under Park-street Church, 200 00
For Horse and Cart, - - - 120 00
For amount due from sundry persons, and payable in labor, plants, &c. 300 00
For amount due from the Hor. Soc. paid 21271 65
D. Haggerston's salary to 1 June, 150 00
For amount due from sundry persons for lots, - - - 1330 00
For Cash on hand, - - - 1646 51

\$24398 16

There are some bills for labor on the grounds not yet presented, which are payable in part in lots, by agreement.

Errors Excepted. GEO. BOND.
Boston, 12 Sept. 1833.

On motion of Z. Cook, Jr. Esq. resolved, That the thanks of the Society be given to ALEXANDER H. EVERETT, Esq. for his valuable and instructive Discourse, and that he be requested to furnish a copy for publication, and that the Committee who waited on him be requested to carry the same into effect.

Voted, That the thanks of the Society be presented to Cheever Newhall and R. L. Emmons for their past services as Treasurer and Secretary of this Society.

It was then voted, To proceed to ballot for officers for the ensuing year, when the following gentlemen were elected.

[See List in last week's N. E. Farmer, p. 82.]

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

Saturday, Sept. 21.

Thomas Mason, Charlestown Vineyard, Dahlias and other flowers. John A. Kenrick, Newton, Dahlias. Messrs. Winship, variety of flowers.

Per order of the Committee,
JONA. WINSHIP, Chairman.

EXHIBITION OF FRUITS.

Saturday, Sept. 21.

By James Read, Esq. Roxbury, Red Colville apples, and two varieties of Seedling peaches, one of them, partaking of the nature of the peach and nectarine, the Committee have named Read's Hybrid Peach. By Dr. Joel Burnet, Southboro', Chelmsford or Great Mogul pear, (local names of a French pear the name of which is unknown.) By Dr. O. Fisk, Worcester, the Green pear of Yair, not considered a very fine fruit. By James Lincoln, Hingham, Seek-no-further apples. By B. V. French, Green Catharine, Red Cheek Melocoton, Pavre Admirable, Lemon Clingstone and President peaches. By S. Badlam, Endicott's Seedling from Canton, of medium quality. By John Mackay, West or Stephens' Genesee pear, brought from Rochester, N. Y. by Mr. M., a large fruit of fine appearance, but past eating. By C. Newhall, Dor-

From the Troy Press.

A STEAMBOAT ON A NEW PLAN.

MR. BURDEN of this city, already favorably known to the public as a most ingenious mechanic, and the author of an important invention, whereby he has secured a fortune to himself, and conferred a great benefit upon the country—we mean his patent *wrought spike machine*—has undertaken no less a task than that of effecting an entire overturn in the construction of steamboats and steam navigation. He is now constructing a steamboat, on a plan peculiarly his own, to run twenty-five miles the hour, and to make a trip from Albany to New York and back by day-light.

Twenty-five miles an hour! a trip to New York and back by day-light!! "six hours out, and six hours in," sounds incredible, visionary, Quixotic! But for all that, the inventor reckons upon such a result with the confidence of mathematical demonstration. And Mr. Burden is a man whose character for sound judgment and mechanical skill has been triumphantly and practically established both in this country and in Britain. If, independent of the proof afforded by actual and successful experiment, the designs of any man are entitled to respect, certainly Mr. Burden's are.

It is not, however, in respect to *speed* only, which is to constitute the chief excellence of Mr. Burden's boat, but in regard to materials, weight, cheapness of construction, and the power necessary to propel it, it is designed to effect a saving of 50 per cent. over the most approved models now in use.

The plan is this: Mr. Burden has constructed two trunks, which, for want of a better similitude, we shall compare to two huge sea-serpents. They are constructed of staves, except instead of hoops on the outside, they are drawn together from the inside by iron rods, having a head at one end and screws cut at the other. These at regular intervals pass from the outside of the trunk through each stave, and through a stout iron in the centre, and are then drawn up and secured fast by a nut. The staves are of pine timber, four inches thick, and from 30 to 80 feet in length. These two trunks are to be placed side by side, sixteen feet apart at the centre, and suitably and efficiently connected together by transverse timbers, upon which the deck is to be laid and the machinery placed. It is designed to propel the boat with one wheel only, which is to be placed *between* the trunks at the centre. The buckets will be sixteen feet long, and the diameter of the wheel considerably greater than in common boats. The engine will be horizontal, like that of the *Novelty*; and is designed ordinarily to exert a seventy-five horse power, but is so constructed that greater may be had if necessary. Mr. Burden, however, does not calculate that more will be required.

The trunks were constructed at Merritt's Mills, below the city, and were launched, or rather *rolled* into the Hudson yesterday. We had the pleasure of seeing one of them deposited in the watery element. The other was launched before we arrived. It is designed immediately to frame them together and lay the deck. This done, the machinery will be applied, and the invention tested by actual experiment. It is proper, however, to say that an experiment has already been made with a boat of smaller dimensions, and trunks *eighty* feet long, the success of which, in the opinion of Mr. Burden, justifies the present undertaking, and is the basis of his entire confidence in its success.

It is difficult to convey, through the medium of a newspaper merely, a distinct idea of such a novel design as this—not only with regard to the form and fashion of the boat, but to explain intelligibly the principles of the science of mechanics and hydrostatics which it is designed to take advantage of in order to obtain success. The reader who is conscious of this difficulty will bear it in mind, in justice to Mr. Burden.

It must be evident that trunks constructed of pine plank or staves, four inches thick, having no timbers, and fastened and drawn together by the power of the screw from within, must be exceedingly light and buoyant; and it is considered, that acting upon the *principle of the arch*, they possess adequate strength. The actual power of the trunks to overcome the resistance that will be presented can perhaps only be determined by experiment; but in regard to buoyancy, that point is ascertained. We apprehend they do not exceed in draught the number of inches anticipated.

Mr. Burden has undertaken a great enterprise—if he succeeds he will have his reward—but experiment alone can determine that point. His boat, *three hundred feet* in length, with an average width of about forty feet, will look more like a floating, perhaps we should say, *flying island*, than any thing that has yet been witnessed in the line of water craft.

From the Amherst Cabinet.

TO YOUNG HOP GROWERS.

THE most common fault with hops at the time of inspection, is their want of strength. In most cases, when hops are marked down by the inspector, the difficulty lies not so much in a bad flavor, as in the want of a sufficient quantity of that aromatic fragrance peculiar to this vegetable, and which is a sure sign of strength and excellence. Hops deficient in strength are, when rubbed in the hand, generally accompanied with a dry, chaffy appearance. The volatile oil, which appears to be the last thing that enters the ovary, [or fruit,] and which yields the fine flavor, and without which the hop is good for nothing, is not there in any considerable quantity. This deficiency in oil, and consequent deficiency in strength and smell, may arise from three causes. The first is *PICKING TOO EARLY*, and before the hop is matured or ripe. Hops picked as soon as they are grown are worth nothing. At that stage, instead of the fruit being saturated with its own volatile oil, as the first sort of hops must be, that oil is only beginning to be elaborated from the sap. The second cause of want of strength arises from *OVER DRYING*. Hops that are perfectly dry and mature, and when picked from the poles are of the first quality, are sometimes dried to seconds or refuse. I am satisfied of this, for I have seen the operation performed in my own hophouse more than once. I have seen good hops dried until the oil was chiefly expelled, and they would rub into chaff and yield but little fragrance. This may be done without burning them, or a change of color. The third cause of weak hops may sometimes, though I think rarely, arise from *NATURE*. I saw a few bales last year grown by some of our most judicious and experienced planters, which were feeble; yet, in all probability, were picked at the right time and cured in the best style. If in some few cases the deficiency of strength arises from causes beyond the control of man, yet generally the planter need not look beyond himself for the groundwork of

seconds and refuse. If hops be killed scantily, care should be taken to shovel over the heap once a day for a few days, and occasionally to examine them down at the bottom. In 1832, hops picked the second week, i. e. after the 10th of September, were better than those of the first week. Hops may be bad, also, from dirty picking, and various other causes. In brief, take care not to pick too early nor dry too much. STEPHEN PEABODY.
Milford, August 15, 1833.

USES OF DOGS.

AT London, within these few years, the use of dogs in dragging light vehicles has become very general; and though their strength is rarely employed in combination, as is the case with the Esquimaux sledge-dogs, their energy makes them capable of moving very considerable weights. There is scarcely a baker, in the more populous parts of London, who has not his travelling shop upon wheels drawn by one or two stout mastiffs or bull-dogs. But the venders of cats' meat appear to have derived the largest benefit from this application of animal powers. The passenger through the narrow streets and lanes of London is often amused by the scenes between the consumer of the commodity and those who bring it to the houses. At the well known cry of the dealer, the cats of a whole district are in activity, anxiously peeping out of the doors for the expected meal, and sometimes fearlessly approaching the cart, without apprehension of their supposed enemy who draws it.

The dogs attached to these carts appear to have no disposition to molest the impatient groups of cats who gather around them. The habit of considering cats and dogs as natural enemies has tended to the production of a great deal of cruelty. It is true that dogs will, by instinct, pursue any thing which flies from them; and puppies will thus run after, and frequently kill chickens. But dogs, by chastisement, may be made to comprehend that nothing domestic must be molested. Beckford, a writer on hunting, alludes to the circumstance of buck hounds playing with a deer on a lawn, within an hour or two after a chase from the same species. There is at present a tame doe, in the streets of London, belonging to some person near St. Clement's Churchyard, which the passing dogs never affront; and we have seen some years ago, at Goodwood, the seat of the Duke of Richmond, a pack of fox hounds on their way to cover, go close to a fox chained at the outer gate of their kennel, without taking the slightest notice of him.

This at any rate, shows that dogs have their instincts under subjection to the commands of their friend and master, man.

CANADA THISTLE.

NOTWITHSTANDING the patriotic and praiseworthy efforts of some of our agriculturists, this detestable weed is increasing, in some sections of the country at least, with alarming rapidity. It need not be so; if not exterminated itself, it need not be allowed thus to exterminate every other vegetable. Its progress at least may be arrested. It spreads entirely from the seeds, and continual cutting will of course prevent those from reaching maturity; the same operation will also in time destroy the plant from the root.—*Detroit Courier*.

CONSUMPTION.

COMPLETELY to eradicate this disease, says a correspondent of the U. S. Gazette, I will not positively say the following remedy is capable of doing; but I will venture to affirm, that a temperate mode of living—avoiding spirituous liquors wholly—wearing flannel next the skin, and taking every morning, half a pint of new milk, mixed with a wine glass full of the compressed juice of horehound, the complaint will not only be relieved, but the individual shall procure to himself a length of days beyond what its mildest form could give room to hope for.

I am myself a living witness of the beneficial effects of this agreeable, and though innocent yet powerful application. Four weeks use of the horehound and milk relieved the pains in my breast, gave me to breathe deep, long and free, strengthened and harmonized my voice, and restored me to a better state of health than I had enjoyed for years.

BEAUTIFUL WHEAT AND BARLEY.

DR. HOSACK sent us a few days ago, a sample of wheat grown on his farm at Hyde Park, the present season, which all who have seen it pronounce the finest they have seen. It is of the variety known as the *white flint wheat*, and it is said to reach the extraordinary weight of sixty-six pounds to the bushel. We understand the yield was thirty bushels per acre. We have frequently during the season heard Dr. Hosack's field of barley spoken of as uncommonly beautiful, affording promise of a most bountiful crop. The field is said to have contained fifty acres—and we have heard more than one gentleman, accustomed in former years to observe the barley fields of old England, and for some years to notice such as are usually grown in this country, speak of Dr. H.'s as decidedly the best field of barley they had ever seen in America.—*Poughkeepsie Journal*.

PRESENCE OF MIND.

WHEN danger befalls us, we generally lose our self possession; but here is an instance to the contrary, from a Paris paper:—"A serious accident recently happened to Mme. Cesar Moreau, which but for her own presence of mind, and promptitude of her husband, might have been attended with dangerous results. Mme. Moreau was sealing a letter, when her dress caught fire, and before she observed it, the flame had made such progress, that she had only time to throw herself on the floor and roll part of the carpet round her, by this means to endeavor to extinguish the fire. M. Moreau, hearing her cries for assistance, was instantly on the spot; and though the flame was happily subdued, he found his lady seriously injured. Recollecting the virtues attributed to cotton in similar cases, he without a moment's loss of time applied this material to the injured parts, and the effect was really remarkable; notwithstanding that her back and one of her arms were very much burnt, such was its efficacy that the sufferer was enabled herself to receive her friends, and of course to reply most satisfactorily to their inquiries."

GAMA GRASS.

WE have observed in several papers, notices of this grass. The accounts of its wonderful prolific qualities, are such as to stagger belief. It is said to be indigenous in the Southern States, in the neighborhood of the sea, and in the western prairies.

The first notice of it appeared in the 13th volume of the American Farmer. Experiments upon it have been made by gentlemen of Missouri, Alabama, and North and S. Carolina. The united testimony of these persons is, that it produces on the light sandy pine lands of the South on an acre, at the rate of between twenty and thirty tons of cured hay per year—that stock of all kinds eat it greedily. That in that latitude it may be cut on the first of May, and every thirty days after till frost comes. The root is perennial, and grows in tufts of many branches from a common root which is tuberous in its form for about three inches, and terminates in many small but strong radicles. The leaves, which, previous to the period of flowering, all issue from the root, are of a deep green color, from two to three feet long, and from one to one and a half inches wide, are shaped like a blade of fodder, and rough or sawed at the edges. The mode recommended for its culture, is, to sow it in drills three feet apart, and two feet between each root in the drill. It is uncertain whether it would succeed in this latitude, but if it yields such astonishing burthens as has been represented, it would be well worth the experiment, even should it be attended with some trouble and cost.—*Detroit Journal*.

From the Genesee Farmer.

FALL PLOUGHING.

A GENTLEMAN called upon us a few days since, and gave us an account of an experiment he was making the present season, to prove whether spring or fall ploughing of sward land for corn was the most profitable.

He stated that he had a field in which the soil was very uniform; that he ploughed one half of it last fall, laying the furrows as flat as possible; the other half he ploughed this spring. In preparing that part which he ploughed in the fall for planting, he had cross-ploughed a part of it breaking up the sod, and a part of it he had prepared by harrowing without disturbing the sod. He had also managed that which was ploughed in the spring, in the same way.

He said, so far, the corn which was planted upon that part of the field which was ploughed in the fall, and prepared by dragging was more forward and of a better color, than that which was prepared by cross-ploughing; either part of the field ploughed looked better than that which was ploughed in the spring.

He gave his opinion decidedly in favor of fall ploughing, as being more economical with regard to team work—that it was more easily cultivated, and that the crops would undoubtedly be better.

NEW ENGLAND FIGS.

MR. John Tufts, has laid upon our table several full grown and well ripened figs, grown in the open air, in the yard of his hotel in West Cambridge. The tree is five years old and has produced fruit three years, though the figs did not until the present season reach maturity. There are at present two other crops of fruit on the tree in different stages of growth, numbering about eighty, from the size of a pea, to that of a full grown fig.—*Boston Traveller*.

QUICK LETTER DELIVERY.

THE late Duke of Queensberry, undertook, for a heavy bet, to convey a letter fifty miles within an hour. The letter was enclosed in a cricket ball, and thrown from one to the other of twenty four expert cricketers, and delivered within the time.—*Quarterly Review*.

APPLES FOR FARM STOCK.

WE copy from the N. E. Farmer, an article written by a man who has for years kept hogs, horses, oxen, &c. in his orchards. There are, we believe, some erroneous notions in the community on this subject. Twelve or fifteen years since, we kept at different times a horse, a cow, and a flock of sheep, in an orchard where there was an abundance of apples, and so far as we could judge, they all thrived and gained flesh. We have kept a milch cow where apples were all the time lying upon the ground, and experienced no injury. There is some danger at first in turning hungry cattle into an orchard full of apples; but after they are accustomed to feed upon them, they will seldom if ever eat too many. According to our recollection, the sheep were quite as much benefitted by the apples as any other animals, but they were somewhat fastidious after apples had fallen plentifully, and ate less than before, and would not eat any of some kinds.—*Hampshire Gazette*.

LARGE APPLES.

WE were shown yesterday eight apples, weighing 7 lbs. 1 oz. one of which weighed over 15 oz. They are of a splendid green color with a little tinge of red, and of the kind called the "Manning Apple." We were also shown a beautiful apple called the "Blue Permain." The above were raised in this town, in the garden of Mrs. S. W. Stearns.—*Obs.*

WEAVING.

ROXANNA LOVE, wove in the Williamsville Factory, Killingly, Conn. in the month of June last, on three looms, three weeks in succession, 806 yards per week, making in the whole 2418 yards of 37 inch Sheetings, averaging to each loom per day, 44 7-100 yards; yarn No. 18. She also wove in one week, on six looms, commencing August 19th, to Saturday the 24th, inclusive 1575 3-4 yards same kind of cloth as above named, averaging 43 3-4 yards to each loom per day; for which she received six mills per yard—\$9 45 cts. for one week.—*Prov. Jour.*

LARGE PEACH.

THE Portsmouth paper mentions, as a wonder, a Peach raised in a garden in that town, weighing 6 oz. and measuring 8½ inches in circuit, every way. Mr Daniel Millet, of this town, a few days since, exhibited a Peach which grew in his garden, weighing half a pound, and measuring 9½ inches one way, and 9 inches the other.—*Salem Register*.

A GOOD DAY'S WORK.

MRS. Deborah Perkins, of Brookfield, N. H., completed her eighty-ninth year on the 7th inst., and on the same day she spun six skeins of yarn, "doubled" four of them, walked half a mile, gathered hemlock for a broom, returned to her house and took tea an hour before sunset.

OATS.

Springfield, Sept. 14, 1833.

WE published in our last an article from the N. E. Farmer, stating that Mr. Smith, of Duxbury, had raised this season an "unprecedented crop" of 74 bushels and 3 pecks of Oats, from four-fifths of an acre, or 93 bushels to the acre. James Kent, Esq., of West Springfield, has this season raised upon an acre only, one hundred bushels.—*Republican*.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 2, 1833.

FARMER'S WORK FOR OCTOBER.

Gathering and Securing Potatoes. It was once the practice in harvesting potatoes to dry them in the sun, as you would grass, intended for hay. This was, formerly, and for aught we know may be still the practice in Great Britain. Loudon says, "Potatoes are stored and preserved in houses, cellars, pits, pies and camps. Whatever mode is adopted, it is essential that the tubers be perfectly dry, otherwise they are certain of rotting, and a few rotten potatoes will contaminate a whole mass."* Rees' Cyclopaedia also says [Art. Potato], "As soon as potatoes are gathered they should be allowed to remain some days to dry, before they are stored." This is precisely wrong. In our climate, an exposure of two or three days to a cloudless sun in September or October would cause potatoes to turn green, strong, and become in some degree poisonous. Judge Buel asserts that "the sun never should shine upon potatoes—they should be housed with all the dirt that adheres to them. It is even beneficial to add more dirt to potatoes in the bin or cask, to exclude external air as much as possible: their surface should be kept moist, and the atmosphere as little above the freezing point as possible." It is recommended, however, not to dig and house potatoes immediately after a soaking rain, but to let them remain a few days to throw off their redundant moisture.

A writer for the N. E. Farmer, whose communication was published, vol. 1, p. 354, gives the following method of securing potatoes: "When the potatoes are ripe in the fall, that is when the vines are dead, I dig them, and put them into a pit, dug on a knoll, with a trench two feet deep leading from the pit out, in which I place a common pump log, with the end to the edge of the hole. After placing boards over the hole, I cover the whole with a thickness of earth sufficient to prevent the frost from reaching them. In this way, any quantity can be put together without any danger of their heating. Care should be taken to prevent the mice from getting to the hole through the log, by nailing a piece of tin, with holes punched in it at the outer end." We believe there is an advantage in this mode of preserving potatoes or other roots, when a large quantity is buried in a heap, arising from the perforated pump log's answering as a ventilator, thus freeing the pit from stagnant air, which often causes roots to rot in the ground.

Arthur Young mentions a way of storing potatoes, in what is called potato pies. "A trench, one foot deep and six wide, is dug, and the earth clean shovelled out, and laid on one side, this has a bedding of straw, and the one horse carts shoot down the potatoes into the trench; women pile them up about three feet high, in the shape of a house roof; straw is then carefully laid on six or eight inches thick, and covered with earth a foot thick, neatly smoothed by flat strokes of the spade. In this mode he never lost any by the severest frosts, but in cases of its freezing with uncommon severity, another coat of straw over all gives absolute security."

Dr. Deane observed that "there is no difficulty in keeping potatoes through the winter in a cellar that is free from frost. Caves dug in a dry

soil, preserve them very well. They should be covered with two feet of earth over them. If they are in danger of frost in a cool cellar, they should be covered with a little salt hay. This any farmer may easily do, who has a maritime situation." Straw will answer where salt hay cannot be procured.

OWNERSHIP OF A NEWSPAPER-ARTICLE.

THE Northern Farmer of the 21st of September states that "the article on the *Wheat insect*, republished in the New England Farmer of the 4th of September ult. page 60, and there credited to the *Vermont Chronicle*, was originally published in the Northern Farmer, of the 10th of August last, page 298, excepting the two last paragraphs," &c.

The article in question, was, we believe, extracted verbatim from the *Vermont Chronicle*, but of what date we cannot recollect. Neither have we any evidence of its having been originally published in the *Vermont Chronicle*, excepting that we find it attributed to that paper on our files. We do not charge our memory with the origin of every article which we republish, but never wittingly (though we may carelessly) omit to note the source from whence we derive every item of consequence to our readers, or indicative of merit in its author. We were, however, about to suppose that the *Northern Farmer* was the *bona fide* owner of the estray, and to mark it as his property, when the *Genesee Farmer* brings forward a claim in the following declaration, to wit:

"The Northern Farmer, in an article on the *Wheat Insect*, has copied very liberally from an editorial article in the *Genesee Farmer*, without giving us credit," &c.—*Gen. Farmer*, Sep. 21, p. 298.

Now as we do not, and never did pretend to own the article, nor any part thereof, we shall leave the question of property to be debated by those who claim an interest in the premises.

ITEMS OF INTELLIGENCE.

The Cattle Show at Worcester, will be on the 9th of this month.

The Annual Exhibition of the Essex Agricultural Society, was at New Rowley on the 19th inst. Proceedings in our next.

The Merrimack Agricultural Society, will hold its Cattle Show and Fair at Concord, N. H. on the 16th and 17th inst.

The Cattle Show of the Rhode Island Society for the Encouragement of Domestic Industry was at Pawtuxet, on the 11th September.

The Berkshire Cattle Show, on the 2d and 3d Oct.

The Hampshire, Hampden, and Franklin Cattle Show at Greenfield, on the 23d Oct.

Large Oats. Mr. Jacob Nelson left at our office the other day a bunch of oats, consisting of one hundred and thirty-six stalks, all from one oat. The stalks were large, one of the joints measured an inch in circumference.—*Maine Farmer*.

Dr. Drake, an eminent physician of Cincinnati, advises that the bodies of persons supposed to have died of Cholera shall be kept as long as possible.—Instances are on record of persons being merely in a state of suspended animation who were thought to be dead. There is no danger of contagion, he says, either before or after death.

On the 13th ult. the bridge across the river Schuylkill at Flat Rock, fell, with two empty marble teams and thirteen horses, which were crossing at the time. Six of the horses were killed or drowned, and one of the drivers was so much injured that he is not expected to recover.

The South District Temperance Society, of Worcester County comprised in 1831, 1895 members; in 1832, 2693; while the present number is 7540. The number of stores within the district which still retail ardent spirits is 40, while the number that exclude it is 62. In 55 taverns ardent spirits are sold; in 285, none! In 9 townships 30 factories are conducted without ardent spirits; and in an equal number of townships, 59 mechanic's shops. Many individuals who were formerly drunkards, have become temperate.—*N. Y. Jour. Com.*

Accident. The wife of Mr. Solomon Crane, of South Middleton, N. Y. died lately from the effects of arsenic. She was somewhat indisposed, and having some cream of tartar in the house, searched for it, and found when too late that she had taken a dose of arsenic.—*Every medicine for family use should be carefully labelled.* A neglect of this has cost many lives.—*Greenfield Gaz.*

Horrid Death. We understand an old lady, the wife of Mr. Levi Kelly of this town, was burnt to death on Monday last. She had been left alone in the house, and it is supposed her clothes caught while at work over the fire. Her dead body was soon after found horribly burnt upon the bed, which was likewise nearly consumed. She had probably sought this place to smother the flames.—*Barnstable Jour.*

Great Turnip. Capt. J. Robertson, has shown us a Turnip, now hanging in his well stored cupboard, which weighed 12 pounds, and measured three feet in diameter. It grew on the farm of Timothy Lovell, of Rockingham.—*Bellows' Falls Int.*

The Regimental Musters in Brentwood, Hampton Falls, and Hawke, were well attended. A number of gentlemen from abroad honored the fields with their presence, and were inclined to enliven the dullness of the scene with the *wheel-of-fortune* and other apparatus of gaming. A modest hint, that their absence would be more acceptable than their company, not being kindly taken, we understand that some accidents happened to their wheels and dice boards, and that a few kicks being vigorously applied to their rear ranks, they "took the idea," and marched off in high dudgeon—very much shocked at the lack of hospitality in New Hampshire.—*Exeter News Letter.*

Caution to Apprentices. A young man was yesterday committed to prison for refusing to remain with his master. He had already served him seven years, and considered he had now a right to leave him. He was, however, bound to remain with him until he attained the age of twenty-one, of which he yet wants 18 months. The law allows a Magistrate to confine him two days in prison for every day he refuses to remain with his master until the expiration of that period.—*N. Y. Jour. Com.*

The Horticultural Exhibition was brilliantly attended yesterday afternoon. The crowd in the evening was immense, consisting chiefly of females—among them many of the most beautiful and fashionable of our city. We learn that there is a great desire on the part of the bachelors who are members of the Horticultural Society, to be placed on the next committee of arrangement.—*Philad. Inquirer.*

The late Dr. Aylett Hawes of Virginia, bequeathed freedom to about 100 slaves, and \$20 for each to assist the Colonization Society to convey them to Liberia.

Out of season. There is in a garden in Bernardston, a cherry tree which has on it at this time, both blossoms and half grown unripe cherries. The tree has produced one bountiful crop of fruit this season, and seems to be dancing defiance to nature and preparing to scatter a continuous supply of its crimson treasures. Gruff old winter, however, will pay it a visit ere long, to strip it of its finery and freeze up the sluices of its generosity.—*Greenfield Gaz.*

* Encyc. of Agr. p. 783.

Journal of Health. This publication has been discontinued, owing, as the Editor says in his valedictory, to "failure of so large a number of the subscribers to pay their arrearages."

In the House of Commons, Aug. 8th, Mr. Briscoe presented a petition from a Mr. Williams, of Reading, relating to the case of Joseph Lancaster (celebrated as the founder of the system of education which bears his name,) now languishing in a jail in America for debt, praying for assistance.

LINNEAN BOTANIC GARDEN AND NURSERIES.

Flushing, near New York.

WILLIAM PRINCE & SONS announce to the public that, from the immense extent of their establishment, they are enabled to furnish such trees of the various kinds, as cannot fail to give satisfaction, by their superior size, vigor, &c.,—and their Nurseries at present contain more than a million of trees and plants in the most thrifty state. Among these are above 50,000 pear trees, of 3 and 4 years' growth from the graft, comprising the most choice new Flemish and other varieties of modern origin. Their new catalogues with the reduced prices, will be forwarded to every applicant, and are as follow:—

- No. 1. Fruit and hardy Ornamental Trees, Shrubs and Plants. pp. 93.
2. Bulbous and Tuberous rooted Plants and Dahlias, &c. pp. 24.
3. Greenhouse Trees, Shrubs and Plants. pp. 44.
4. American Indigenous Trees, Shrubs and Plants. pp. 50.
5. A catalogue of Vegetable, Field, and Flower seeds.

To the Proprietors of Nurseries, and to those who may wish to establish new Nurseries, they will furnish all articles desired, at a liberal discount and a convenient credit; and in all other cases where large quantities are wanted, a reasonable abatement will be made. They will also supply all vendors of seeds, and those who wish to engage in that business, with every variety of Vegetable, Field and Flower seeds, at very low rates. These seeds possess the advantage of being raised under their own observation, or when imported, of being tested to their satisfaction, and their accuracy and vitality are expressly guaranteed. Many new and choice kinds will be found in the catalogue, which have never before been offered to the public. The collection of Bulbous flower roots and Dahlias is particularly rich and extensive, and of the latter, they have a specimen bed covering an acre of ground, and comprising 600 varieties now in full splendor. Bulbous roots and Dahlias are easily transported, and can be vended in a dry state, in seed Stores, &c. and an establishment for the sale of these articles ought to exist in every town in the Union. It will be readily perceived, that the great number of trees, &c. always in the Nurseries, enables the proprietors to make superior selections, and secure to all applicants this particular advantage.

As it is deemed unnecessary to continue any Agency at Boston, it is requested that all orders be sent *direct per Mail*, and the utmost attention will be paid to forwarding them agreeably to order. oct12

TREES, SEEDS, PLANTS, &c.

THE Subscriber having been regularly bred to the business of Horticulture, &c. in England, and having resided in, and visited different parts of the U. States—considers himself fully qualified to select any thing in the line—as he has business that will call him to England, the first of November, he will undertake to select and see personally to packing and shipping to any part of the U. States any thing that may be requested in his line for a small commission. The most respectable references given as to character and capacity. Please address communications to the care of Messrs. G. THORBURN & SONS previous to Nov. 1. JOSEPH LODGE. oct 2

GREEN HOUSE GLASS.

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, **THE NEW AMERICAN ORCHARDIST**, or a treatise on the cultivation and management of *Fruits, Grapes, Ornamental Shrubs, and Flowers*, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

VALUABLE FARM AT AUCTION OR PRIVATE SALE.

THE Subscriber offers for sale a Farm situated in the town of Marlboro', Mass. about half way between Howes' Tavern and the Lower Meeting-House. It consists of 140 acres of excellent land, with a large two-story Dwelling House, two Barns, Chaise and other Out-houses, with two fine Wells of Water. About 70 acres of the land is covered with a fine growth of the best quality of Wood; the remainder, consisting of Mowing Lands, Tillage and Orchard, is in a high state of cultivation. It now supports 20 head of horned cattle, horses, swine, &c.

For the last 25 years, this estate has been improved by Mr. William Wilson, deceased, and for 50 years previous thereto, it was known as "Munroe's Tavern." The excellent quality of its soil, the large and valuable quantity of wood, and its other numerous advantages, make it a most desirable situation for a farmer; while its situation (on the old road to Worcester, on which the travel is great, the distance from any other tavern and its former notoriety as one,) makes it a no less desirable situation for a Tavern again.

The above estate, free from all incumbrances whatever, will be sold on Friday the first day of November, unless previously disposed of by private sale. As also, at the same time, all the cattle, a large quantity of hay and grain, farming utensils, &c. as are not previously disposed of.

Terms of purchase made known on the day of sale. Likewise, several other lots of land belonging to the same estate, will be sold at the same time.

JOSIAH WILSON, Administrator.

For further information, apply to **WEBBER WILSON**, on the premises, or to Messrs. **LOT WHEELWRIGHT & SON**, No. 46 Central Wharf. sep 11

CLOVER SEED.

4000 lbs. Northern Clover Seed.—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by **E. WIGHT**, Druggist, 46 Milk st. opposite Federal st. sept 11 eow6w

GRASS SEEDS, (for full sowing.)

FOR sale at the New England Seed Store, 51 and 52 North Market Street.

Clover, (Northern)—Herds Grass—Red Top—White Clover (fine imported)—Lucerne, &c. &c.—Wholesale and Retail.

PEMBROKE BUTTER AND TABLE SALT.

Just received by Schr. Boston Packet—301 barrels and 360 sacks Butter Salt. 6600 loaves Table Salt.

Abundant evidence is before the public of the quality of this Salt being superior to any hitherto manufactured in any part of the world. As such we warrant it and offer it for sale. June 5 **CHAS I. CAZENOVE & CO.**

BOOKS.

Books upon Agriculture, Horticulture, and Rural Economy, Published and for sale by Geo. C. Barrett, N. E. Farmer Office, 52 North Market st. Wholesale and Retail Booksellers supplied on very liberal terms, and their orders solicited. aug 14

BRIGHTON MARKET.—MONDAY, OCT. 2, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 870 Beef Cattle, 238 Stores, 4450 Sheep, and 630 Swine—about 1500 Sheep remain unsold.

PRICES. Beef Cattle.—Sales were quite unequal, but will average about the same as last week, for the same quality. We shall quote the same, viz. prime at \$5 a 5 50; good at 4 50 a 5; thin, and Steers and Cows at 3 25 a 4 25.

Barrelling Cattle.—A few were taken, but we are unable to give prices.

Cows and Calves. Sales at 20, 23, and \$27.

Stores.—Yearlings \$7 75 a 11; two year old 11 a 15;—a large number of buyers, but not many sales.

Sheep.—Lots were taken at \$1 50, 1 62, 1 67, 1 75, 1 88, 2 00, 2 17 and 2 25.

Swine.—A lot of 200 were taken, price not known; a small lot of large Sows and Barrows at 4c.; two lots of large, selected Barrows at about 4 1/2c.; a lot of Shoats to close at 3 1/2 for Sows, and 4 1/2 for Barrows. At retail, small Shoats at 5 for Sows and 6 for Barrows; large, 4 1/2 for Sows, 5 1-2 for Barrows.

MISCELLANY.

IMPRISONMENT FOR DEBT.

Why do ye tear
 Yon lingering tenant from his humble home?—
 His children cling about him, and his wife
 Regardless of the wintry blast doth stand
 Watching his last, far footsteps with the gaze
 Of speechless misery.—What hath he done?—
 In passion's madness did he raise the steel
 Against his neighbor's breast,—or in the stealth
 Of deep, deliberate malice, touch his roof
 With widely desolating flame?—No.—No.—
 His CRIME IS POVERTY.—He had no hoard
 Of hidden wealth from whence to satisfy
 His creditor's demand.—Sickness perchance
 Did stay his arm,—or adverse skies deny
 The promis'd harvest,—or the thousand ills
 That throng the hard lot of the sons of toil
 Drink up his spirits.—Ye indeed may hold
 His form incarcerated,—but will this repair
 The trespass on your purse?—To take away
 The MEANS of labor, yet require its FRUITS
 In strict amount, methinks doth savor more
 Of ancient Egypt's policy, than Christ's.—
 Themis, perchance, may sanction what the code
 Of Him who came to teach the law of love,
 Condemns.—“HOW READEST THOU?”

There are who deem
 The smallest portion of their drossy gold
 Full counterpoise for liberty and health,—
 And God's free air, and home's sweet charities,
 'Mid the gay circle round their evening fire
 They sit in luxury,—the warbled song,
 The guest,—the wine-cup speed the flying hours,
 Eagerful how the captive's head doth droop
 Within his close-barr'd cell,—or how the storm
 Doth hoarsely round his distant dwelling sweep
 Where *she* who in their lowly bed hath wrapp'd
 Her famish'd babes, kneels shiv'ring by their side,
 And weeping mingles with her lonely prayer.—
 —Revenge may draw upon these prison-grievs
 To pay her subsidy,—and sternly wring
 An usury from helpless woman's woe,
 And infancy's distress,—but is it well
 For souls that hasten to a dread account
 Of motive and of deed, at Heaven's high bar,
 To BREAK THEIR SAVIOUR'S LAW?—

—Up—cleanse yourselves
 For this dark vestige of a barbarous age,—
 Sons of the gospel's everlasting light!—
 Nor let a brother of your own blest clime
 Rear'd in your very gates, participant
 Of freedom's and salvation's birthright, find
 Less favor than the heathen.—It would seem
 That *MAN*, who for the fleeting breath he draws,
 Is still a debtor, and hath nought to pay,—
 He who to cancel countless sins expects
 Unbounded clemency,—'twould seem that he
 Might to his fellow-man be pitiful,
 And show that mercy which himself implores.

LOAN TO A HIGHWAYMAN.

A QUAKER was stopped between Brentford and London by a highwayman, who demanded his money—the Quaker answered, “Well, friend, if thou art in want of money I will lend thee some.” The same demand and answer were repeated several times, till the highwayman became impatient, and the Quaker reluctantly gave up all his cash, which was very considerable. The highwayman then perceiving the Quaker to have a better horse than his own, insisted on his exchanging. The Quaker answered, “Well, friend, if thou thinkest my horse will be of more service to thee than thine own, thou shalt have him”—and accordingly

they exchanged. On the Quaker's arrival in London, he slackened the reins of the highwayman's horse, and let the animal take his own course—the horse stopped at a livery stable in Holborn, the Quaker alighted, and when the hostler came, inquired if he knew the horse? The hostler answered in the affirmative, and that he belonged to Mr. —, who lived in — square. The Quaker took no further notice, but left the horse and his address. The next day the highwayman brought the Quaker's horse, and told the hostler he had sold his own horse, and purchased another—when, to his great surprise, the hostler informed him of his horse being brought home, and what passed at the time. The highwayman went to the Quaker's house, who accosted him with, “Well, friend, hast thou brought the money I lent thee?” The highwayman said he had, and falling on his knees, implored mercy and secrecy. “I lent thee the money,” said the Quaker, “because my principles allow me not to swear even to a robber; I will conceal thy name, in hopes of thy amendment; beware how thou spendest thy money in future, and thou wilt have the less occasion to borrow.”

A PROUD MAN

—Is a fool in a fermentation, that swells and boils over like a porridge pot. He sets out his feathers like an owl, to swell and seem larger than he is. He is troubled with a tumor and inflammation of self conceit that renders every part of him stiff and uneasy.—Butler.

GRATUITOUS SERVICES: A NEW DEFINITION.

By “gratuitous services” we have hitherto been accustomed to understand services performed without fee or reward of any kind. But from certain circumstances which have recently transpired, it appears that this expression is susceptible of another meaning, and that, by “gratuitous services,” we are to understand “services performed for a gratuity.”

DESCENDANTS OF THE MAY-FLOWER'S COMPANY.

DEACON John Cook, of Kingston, son of Sylvanus Cook, who was son of John Cook, who was son of Jacob Cook, (the man who stood with the Indian who shot King Philip) who was son of Jacob Cook sen'r, who was son of Francis Cook who came to Plymouth in the May Flower in 1620, picked from a tree, the present season, an apple which measured 14 1-8 inches in circumference?—*Transcript.*

ENORMOUS TREE.

A SYCAMORE TREE of most singular and extraordinary size has been brought to this city from the western part of the State. The interior is hollowed out, and will comfortably accommodate some forty or fifty persons. It is splendidly furnished as a sitting room, and contains every article of elegance or usefulness. It has a handsome piano, sofas, glasses and mirrors, of a fit and becoming style; is decorated with pictures and fancy articles, and will be open this evening to the inspection of a selected and invited party. On Monday evening it will be thrown open to the public view in the Saloon of the American Museum, when several Ladies Schools will pour forth their pretty little tenants of the play ground to witness this huge tenant of the woods.—*N. Y. Trav.*

THE NEW COPPER MINE

—RECENTLY discovered in Luzerne county, Penn. has been opened about twenty yards in length, and four feet thick; the ore is imbedded in grawacke, and in appearance very extensive. A specimen of the ore, and also of the copper made from it, was a few days since shown to the Wycoming Herald, who was assured that the yield was fifty per cent. If so, it is of itself ‘a mine of wealth,’ and will add much to the universal resources of the county, already rich in minerals, and all it wants to convert it into the solid metal is ‘capital.’

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. From the Boston Daily Advertiser.

BRIGHTON CATTLE SHOW.

EXHIBITION OF MANUFACTURES, PLOUGHING MATCH, &c.

THIS interesting exhibition, as has been before stated, takes place at Brighton on the 16th inst. under the charge of the Trustees of the Massachusetts Society for the Promotion of Agriculture. As it is truly a Festival to the Yeomanry of the State, we publish below, in an abridged form, a list of the liberal premiums offered by the Society, comprising, in addition to the sum generously granted by the State, the whole income of their own funds. This fair, as for some years past, will occupy but one day. Animals may be offered for premium at Brighton, although they have obtained premiums at the County Shows. All entries of animals for the Pens or as Working Oxen, must be made before the evening of the 15th. The Ploughing Match will commence at 9½, A. M. and the trial of Working Oxen at 11, precisely: the public sale of Manufactures and Animals at 12. Other regulations of the Show, will be found in the placards of the Society, which were forwarded to the several towns by the Members of the Legislature, at the close of the last session.

For Stock.—For the two best Bulls above one year old, \$20 and \$10; two best Bull Calves from 5 to 12 months, 10 and 5; two best Cows, not less than 3 years, 25 and 15; next best Cow, 10; three best Heifers, not exceeding 3 years, whether they have had calves or not, 15, 12 and 8. The Bulls, Cows and Heifers, for which premiums are awarded, to be kept at least one year thereafter within the State. The owner of each Bull, Bull-Calf, Cow and Heifer offered for premiums, must produce an affidavit of the origin and character of the animal, and of the quantity and quality of the milk yielded by the cows, together with the manner in which they are fed and kept.

For the three best Oxen, fitted for slaughter, regard to be had to, and a particular statement to be given of, the mode and expense of fattening, \$25, 20 and 10; five best pair of Working Oxen, \$25, 20, 15, 12 and 8. No oxen to be admitted to trial as working oxen under four years old.

For the best Dishley Ram and Ewe, \$20 each; best South Down Ram and Ewe, \$20 each. The above premiums will be awarded on Sheep either imported or raised in the State; but the persons receiving the premiums are to enter into obligation to keep the same within the State for breeding.

For the two best Boars, not exceeding 2 years old, \$10 and 8; two best Sows, \$10 and 8. (To be kept one year thereafter for breeding, by the persons receiving the premiums.) Best Pigs, not less than two in number, not less than four months old, nor more than eight, \$10; next best lot, \$5.

None of the above animals, except Sheep, as above specified, will be entitled to premiums, unless they are wholly bred in the State of Massachusetts.

Butter and Cheese.—For the two best lots of Butter, not less than fifty pounds, \$20 and 15; two best lots of Cheese, not less than one year

old, and not less than 100 lbs. \$20 and 15; best Cheese, less than one year old, and not less than 100 lbs. \$10; for the greatest quantity of Butter and Cheese made between the 15th of May and the 1st of October, from and not less than four Cows, the quantity of Butter and Cheese, and the number of Cows, to be taken into consideration, and specimens to be exhibited at the show, of not less than 20 lbs. of each, and the mode of feeding, if any thing besides pasture is used, 20. Besides the above premiums for Butter and Cheese, the trustees will award the following in the month of December: for the two best lots of Butter in tubs, pots, or firkins, not less than 300 lbs. 50 and 30; best lot not less than 100 lbs. 30; best lot of Cheese; not less than one year old and not less than 300 lbs. 30; best lot of Cheese, less than one year old, and not less than 300 lbs. 25.

The claimant for the several premiums on Butter to be exhibited in the months of October and December next, must state in writing the following particulars, viz.: the number of cows kept on his farm; his mode of keeping; the treatment of the milk and cream before churning; the mode of churning, winter and summer; measures adopted to express the butter-milk; the quantity and sort of salt employed; whether saltpetre, or any other substances have been used in the process; the best time for churning, and keeping Butter in, hot weather, and the best mode of preserving it, in and through the summer and winter, and in what vessels.

The claimants for the several premiums on Cheese, must state the mode of making the same, and the following particulars, viz. the number of cows kept; whether the Cheese is made from the proceeds of one, two or more milkings; whether any addition is made of cream; the quantity and sort of salt used, and the quantity of rennet; the mode of pressure, and the treatment of the Cheese afterwards.

Farmers in the several States are invited to compete for these premiums, at the exhibition in December.

Claims for the premiums on Butter and Cheese, last above mentioned, must be made in writing, addressed to Benjamin Guild, Esq. Boston, post paid, on or before the 2d of December next; and the parcels deposited before Tuesday the 3d, at a place to be designated hereafter by the Trustees, on which day, at 10 o'clock, A. M. the Committee will examine the lots, and none will be admitted after that hour. The premiums will be awarded on the 4th. Each lot must be marked with the initials of the owner's name, and the place of manufacture. It is particularly recommended to the competitors, that the Butter be put up in the nicest manner. There will be a public auction after the examination by the Committee, and those who desire to sell will have an opportunity without any charge for auctioneer's fees; but the government duty must be paid by the owners of the butter and cheese. The Committee will be at liberty to withhold from the auction sale, any parcels either of butter or cheese, which they may have reason to suppose, from the ordinary quality of the same, or other circumstances, may have been sent merely for sale.

Vegetable and Grain Crops.—For the greatest quantity of Carrots on half an acre, not less than 300 bushels, \$15; greatest quantity of Potatoes on an acre, not less than 500 bu. 20; greatest quantity of Mangel Wurtzel, or Scarcity root, on an acre, not less than 600 bu. 20; greatest quantity of Parsnips on half an acre, not less than 200 bu. 10; greatest quantity of Ruta Baga on an acre, not less than 600 bu. 20; greatest quantity of common Turnips on an acre, not less than 600 bu. 20; greatest quantity of Onions on half an acre, not less than 300 bu. 15; greatest quantity of vegetables, grain, peas, and beans excepted, for home consumption, and not for sale, raised for the keeping of stock, regard being had to the size of the farm in proportion to the crop, and to the number of the stock kept; and also to the respective value of the vegetables as food, and the expense of raising the same, 30; greatest quantity of Indian Corn on an acre, not less than 80 bu. 20; next greatest do. 15; next greatest do. 10; greatest quantity of Winter Wheat on an acre, not less than 30 bu. 20; greatest quantity of Barley on an acre, not less than 40 bu. 20; greatest quantity of Rye on an acre, not less than 30 bu. 20; greatest quantity of Millet on an acre, and cut and cured for hay, not less than three tons, the claimant giving evidence of the time of sowing, the quantity of seed sown, and the quantity of hay produced, 20; greatest quantity of Mustard Seed, not less than 15 bu. 20; greatest quantity of dressed Flax, not less than 500 lbs. from an acre, 20; greatest quantity and best quality of Hemp on an acre, 40.

It is to be understood, that the quantity of land specified above is, in each case, to be in one piece. And the claimant of any of the above premiums shall, with one other person, make oath to the following particulars, before some Justice of the Peace, and with a certificate of the same, shall obtain a certificate of the measurement of the land by some Surveyor. The particulars are—

1. The condition of the land in the Spring of 1833.
2. The product and general state of cultivation, and quality of manure used upon it the preceding year.
3. The quantity of manure the present season.
4. The quantity of seed used, and if Potatoes, the sort.
5. The time of sowing, weeding and harvesting the crop, and the amount of the product ascertained by actual measurement, after the whole produce for which a premium is claimed, is harvested, and the entire expense of cultivation.
6. Of Indian Corn, the entire crop of the acre to be offered for premium is to be shelled and measured in the presence of the claimant, who is to make oath to the truth of the statement made by the person or persons, who did harvest, shell and measure it; and to be measured between the fifteenth of November 1833, and the first day of January 1834.
7. At least 40 bushels of the vegetables, for which a premium is claimed, except potatoes, onions, and common turnips, are to be weighed free from dirt, and 56 pounds will be considered a bushel.

The best Cultivated Farms.—For the two best cultivated Farms, \$150, and 100.

[Claims for the premiums on Farms were to be addressed to Benjamin Guild, Esq. Boston, (post paid) before the 1st inst. and the evidence to support them is to be sent to him on or before January 1, 1834.]

Experiments, Discoveries and Inventions.—For the experiment of turning in Green Crops as a manure, on a tract not less than one acre, and proving its utility, giving a particular account in writing under oath of the process and result, \$20. For the most successful use of the Drill Plough, in the cultivation of any small grains or seeds, on a scale of not less than one acre, \$20. For the effectual and satisfactory mode of extirpating the Worm that attacks the Locust tree, \$100. For a new, effectual, and satisfactory mode of extirpating the Borer which attacks the apple tree, \$50. For a newly invented Agricultural Implement, or Machine, superior to any designed for the same use, that shall have heretofore gained a premium, a reward not exceeding twenty dollars, according to the importance of the invention, \$20. To the person who shall prove to the satisfaction of the Trustees, that his mode of rearing, feeding and fattening neat cattle is best, \$20.

Trees and Live Hedges.—For the best plantation of White Oak trees, not less than one acre, nor fewer than 1000 trees per acre, raised from the acorn, not less than three years old, and which shall be in the most thriving state, September 1, 1834, \$50. For the best plantation of White Ash, Larch, or Yellow Locust trees, each of not less than one acre nor fewer than 1000 trees per acre, to be raised from the seeds, and which trees, not less than three years old, shall be in the most flourishing state, September 1, 1833, \$25. For the best Buckthorn Hedge, not less than 100 rods, and which shall be in the most thriving state in 1833, \$30. Claims under the two last heads, together with the proper evidence, must be delivered to B. Guild, Esq. Boston, free of expense, on or before January 1, 1834.

For Domestic Manufactures.—For the greatest quantity of raw manufactured Silk, not less than 10 lbs. raised by the claimant, and presented before the 1st of December, 1833, \$20. For the best 10 qr. Woollen Blankets, not less than ten pairs, \$50; best Worsteds Camlet or Bombazetts, not less than sixty yards, \$40; best Linen Sheetings, not less than fifty yards, \$30; best Linen Shirtings, not less than fifty yards, \$30; best Sewing Silk, not less than ten lbs. \$30. All the above must be manufactured within the State of Massachusetts. All the manufactures, when presented, must have a private mark; and any public or known mark must be completely concealed, so as not to be seen or known by the Committee, nor must the proprietors be present when they are examined—in default of either of these requisitions, the articles will not be deemed entitled to consideration or premium.

Gratuities will be given, for specimens of useful and ornamental manufactures, of extraordinary quality, presented at the hall for exhibition, not exceeding \$25 in the whole.

Ploughing Match.—Premiums will be given to the owners and Ploughmen of the three Ploughs, drawn by two yoke of oxen, and to the owners and ploughmen of three ploughs drawn by one yoke of oxen, which shall be adjudged by a competent committee to have performed the best work

with the least expense of labor, not exceeding half an acre to each plough. Entries may be made of the names of competitors until the morning of the 16th. A part of the field distinct from that for the double teams, will be assigned to the single teams. The ploughs to be ready to start at 9 o'clock, A. M.

Double Teams.—First Plough \$15, ploughman 8, driver 4. Second Plough 10, ploughman 5, driver 3. Third Plough 6, ploughman 3, driver 2.

Single Teams.—First Plough \$15, ploughman 10. Second Plough 10, ploughman 6. Third Plough 6, ploughman 4. No driver will be allowed to a single team. To the plough which shall be adjudged best of all those at the ploughing match, \$10.

From the Yeoman's Gazette.

MIDDLESEX CATTLE SHOW.

THE Anniversary of the Middlesex Society of Husbandmen and Manufacturers, was celebrated on Wednesday last, with the usual exhibition of cattle, manufactures and products. Notwithstanding the rainy weather, the Farmers of Middlesex showed they were not afraid of a storm, and came in as great numbers as on any former celebration. We were particularly pleased to see the dense crowd that watched with interest the trial of Strength of Working Oxen, standing in the mud and shower.

There were as many entries in the pens as formerly, but it was thought the stock had not the fatness and beauty such as has been exhibited before. The exhibition of manufactures was much larger than last year; last year 126, this year 163—and in quality and value no falling off. There was a novel and very gratifying exhibition of one team of oxen, comprising one hundred and seventy-six yoke—which paraded through the streets in a discipline as useful, if not as exact as the military; the 110 drivers of this team then partook of a dinner at Wesson's Hotel. We hope this will be repeated, and the next year will produce a much larger team,—for we believe that every farmer has oxen, which he would be proud to show.

The Oration by Dr. Bartlett of Lowell, was a learned treatise on the philosophy of the vegetation of plants. After the committees had inspected the cattle, and articles in the Court-house, the Society sat down to a dinner at Shepherd's, where were served up the elegant fruits which had been offered for exhibition; several toasts were drunk with (cider) the wine of our country—for which Messrs. Barrett of Concord, and Rice of Marlboro', obtained the Society's premium.

On the whole we have never seen a Cattle Show go off better—with more life and harmony—and with better proof of the usefulness and industry of our county.

At the close of the day the following gentlemen were chosen officers of the Society, for the year ensuing:

Benj. F. Varnam of Dracut, President.

Abner Wheeler of Framingham, and Abel Jewett of Pepperell, Vice Presidents.

Cyrus Stow, Treasurer; John Stacy, Recording Secretary; Edward Jarvis, Corresponding Secretary; all of Concord.

The following is extracted from the list of premiums, as given in the *Yeoman's Gazette*.

Farms.—Abra'm How, of Marlboro', 1st prem. \$25; Abel Moore, of Concord, 2nd do. 20; James

Eustis, South Reading, best orchard, 15; Asa Parker, Acton, next, 12; Robert Chaffin, Acton, next, 6; Anthony Wright, Concord, mulberry trees, 25.

Ploughing Match: Double Team.—Sherman Barrett, of Concord, 1st prem. \$10; James Baker, Lincoln, 8; Silas Conant, Concord, 6; Abner B. Lane, Bedford, 4; Anthony Wright, Concord, 3.

Single Teams.—James Jones, of Concord, 1st prem. 10; Hezekiah Wetherbee, of do. 8; Joel Prentiss, of do. 6; Asa Melven, of do. 4.

Working Oxen.—Josiah Blodget, of Billerica, \$10; Asa Brooks, of Concord, 8; Henry Fiske, Lincoln, 6; Silas Conant, Jr., 5; Eliab B. Lane, Bedford, 4; Edward Wetherbee, Acton, 3.

Fat Cattle.—Daniel Wilson, of Billerica, best fat ox, 8; Zadoc Rogers, Tewksbury, next, 5;—Abiel Parker, gratuity, 5.

Milch Cows.—John Leathe, Waltham, 1st prem. 12; James Adams, Concord, 10; Jona'n Rice, Marlboro', 8; Paul Adams, Concord, milch heifer, 8; G. M. Barrett, Concord, next best, 6.

Neat Cattle.—Jona. Rice, Marlboro', for best 2 y. bull, 12; Hervey Reeves, East Sudbury, 2d best, 8; Zadoc Rogers, of Tewksbury, bull calf, 5; James Brown, of Framingham, 3 y. steers, 7; John Blood, Pepperell, next best, 5; Edmund Rice, of Marlboro', 2 y. steers, 6; James Brewer, Framingham, yearling steers, 4; Hollis Cloyes, Framingham, steer calves, 4; James Wood, Concord, next, 3; Edridge Meriam, Bedford, 2 y. old heifer, not having had a calf, 6; James Brown, Framingham, next, 4; David Blood, Pepperell, heifer calf, 5; Asa Parker, Acton, next, 3.

Swine.—C. W. Johnson, of East Sudbury, for best breeding sow, 8; Henry Flagg, Weston, next, 6; Jos. Darby, Concord, best boar, 8; O. Taylor, Concord, next, 6; Henry Flagg, Weston, for Pigs, 3; C. W. Johnson, next best, 3.

Fruit.—Nathan Chandler, Lexington, specimen of Sweeting and Baldwin apples, 1; N. S. Bennett, Framingham, apple for the table, '50; Lawson Buckminster, of Framingham, Porter apple, '75; Charles Wheeler, Lincoln, for apples, '50; Dr. Ripley, for sweet pound pear, 1; Samuel Fletcher, Westford, Porter apple, 1; Abel Powers, Acton, Porter apple, 2; Eben How, Marlboro', for King Pippin, and Seek-no-further apple, 1,50; Henry Robertson, Concord, Porter apples, 1; Hosea Wesson, Lincoln, for apple, '75; Nehemiah Hunt, Concord, for Paimains 1,50; Charles L. Tarbell, Lincoln, for apples, '75; Thomas Heald, Carlisle, Paimains, '75; Fitch Tufts, Billerica, apples superior, 1,75; Henry Richardson, Billerica, greenings, '75; Daniel Chandler, Lexington, black Hamburgh, frame grapes, 3; James Eustis, South Reading, Isabella, 2; D. Chandler, Lexington, Isabella, 1,50; Lawson Buckminster, Framingham, sweet water, white, and Isabella, 2; N. S. Bennett, Framingham, native grape, '50; Daniel Shattuck, Concord, for pears, '75; Eliphalet Wheeler, Framingham, for watermelon, 1.

Butter and Cider.—Michael Crosby, Bedford, best firkin Butter, 10; Amos Wellington, Ashby, next, 8; Jos. Darby, Concord, new churned Butter, 5; Alex. Makey, Billerica, next, 3; Augustus Tuttle, Concord, next, 2; Geo. M. Barrett, Concord, for 3 doz bottles cider, 8; Jona. Rice, Marlboro', do. 5.

Leather.—Isaac Brooks, Lincoln, best calf Skins, 6; do. next best, 4; Benjamin Dix, Littleton, Sole Leather, 1; Storer and Hovey, Charlestown, next, 4.

Straw or Grass Bonnets.—Lydia Whitney, of Stow, 1st prem. 3; Martha A. Conant, Acton, 2d, 2; Clarissa Wheeler, Framingham, a beautiful bonnet wreath, a gratuity of 2.

Boots and Shoes.—Joel N. Outhank, Weston, best cow hide boots, 6; Samuel A. Thurston, Concord, ladies' cloth shoes, 2; Wright and Mixer, Lowell, gratuity, 1.

Inventions. Nathaniel S. Bennett, of Framingham, for an iron bow, for fastening cattle in the stable, 2; John Buttrick of Cambridge, for an improvement in a carpenter's rule, 3; James Eaton, Concord, a fowling piece, a neat and beautiful specimen of workmanship, 3; James Adams of Concord, for a specimen of the spirit level, 1.

The following notice of Toasts given at the Middlesex Cattle Show is from the *Bunkerhill Aurora*.

REGULAR TOASTS.

Our Anniversary.—Let it be welcomed, for here all may draw together in the good cause of improvement.

President Jackson and Daniel Webster.—The victory of the former at New Orleans will be long remembered; but the joint victory of both over nullification will never be forgotten.

Our Governor.—His exhibition of the old farm "Massachusetts," after being the overseer for eight years, fairly entitles him to the highest premium.

The division of labor and the labor to divide.—The one always keeps the horse before the cart; the other tips over both cart and horse.

Our next Gubernatorial Canvass.—So many parties are entering the lists—such queer teams harnessing up, that the Commonwealth is in danger of being drawn in quarters, or starting wrong end foremost, next year.

The Temperance Cause.—It has nearly destroyed ardent spirit—let it go on till it nullifies intemperance, in politics and religion.

Banks.—The best, are those where capital springs from enterprise, industry and economy—from such banks no government can remove the deposits.

The Presidential Ploughing Match.—Let the rules be altered—let no man who has received the first premium contend for it again, and never suffer him to plough for others.

Major Jack Downing, President Jackson and Esquire Biddle's Bank.—Three modern wonders—the first has more wit—the second more spunk—the last more "real chink" than all the rest of creation.

New England takes the first premium.—"General" says I, "did you see the farms and the work shops all along there, down east?" "Major," says he, "Major, its capital."

VOLUNTEER SENTIMENTS.

By Rev. Dr. Ripley. *The Anniversary of our Society*—may the spirit and harmony of this day attend all its future returns, and may we go on improving until improvement shall be unnecessary.

By Rev. Mr. Goodwin. *The Orator of the Day*—may he never be less fortunate in the selection of a subject or less skilful in its dissection.

Dr. Bartlett having found it necessary to return to Lowell before the dining hour, left with the President the following sentiment:—

Civil freedom in Europe.—It will be attained and enjoyed only when the Cultivators of the soil become, as they are here, its Owners.

By Rufus Hosmer, Esq. of Stow. *Rev. Dr. Ripley*—He has given additional evidence this day

that in old age he produces the best fruit. [This toast alludes, probably, to several kinds of superior apples exhibited by Dr. Ripley, from an orchard which he said he set out when an old man, and from which he never expected to live to take the fruit. This, he hoped would encourage gentlemen to set out orchards early in life—if they did not do it then, do it later—they would do somebody good.]

By Rev. Mr. Ripley, of Waltham. *The County of Middlesex*—Fruitful in historical recollections, worthy to be remembered by the inhabitants—Concord, Lexington, Bunker Hill!

By Benj. Wheeler, of Framingham. *New England Soil.* Generally better than it is believed to be. [Mr. Wheeler, accompanied his toast with some remarks on the method of cultivating meadow lands, which he believed were equal in fertility to the far-famed lands of the West, if only properly drained and cultivated.]

By Hon. John Keyes. *The various occupations of life*—all useful if rightly used; all honorable if honorably pursued; and all profitable, if the profit and loss account is well kept and properly balanced.

By Col. Wm. Whiting. *The old farm, Massachusetts.* Look well to the next Overseer—we are willing to employ one who wears a leather apron, but he must never wear a Q.

At 4 o'clock P. M. the Premiums were awarded in the Court House. The Society subsequently proceeded to the choice of its officers for the year.

In the evening, there were two balls, at Shepherd's and Wesson's hotels.

MASS. HORTICULTURAL SOCIETY.

PROCEEDINGS

Of the Mass. Hor. Society at the Hall of the Institution, on Saturday Oct. 5, 1833.

From Alexander Walsh, Esq. the following letter was read by the President, who stated that the seed named therein had been placed in the hands of the Gardener at Mount Auburn, for cultivation.

Lansingburgh, 19 July, 1833.

Dear Sir, I send your Society, to be planted in Mount Auburn garden, a large parcel of Wood fringe seed *corydalis fungosa*, the produce of my soil. It will answer to plant this pretty hardy creeper this month; it grows from seed the first, and runs to vine the second year.

I purpose visiting your splendid garden (if nothing happens to prevent) about this time next season: shall then look along the Indian ridge for the 'fringe,' and around the other beautiful avenues for your society's posthumous glories! choice collection,

"Upraised from seed or bulb, interred in earth."

Report speaks volumes in praise of your cemetery; from the rapid and regular advances of your society in this great, this grand work, the public are led to believe there can be no hindrance to its full completion, but what ingenuity, perseverance and taste, must conquer.

I am propagating, in a little nursery, trees and shrubs for your garden, among which are the Three-leaved Bladder nut, *staphylea trifoliata*; Hop tree, *ptelea trifoliata*; Pocock's dark yellow Senna, *colutea pocockii*; Pecan nut, *juglans oliviformis*; Filberts, &c. &c.

Wishing complete success to your very laudable undertakings, I remain very respectfully,

Yours, &c. &c. ALEXANDER WALSH.

Hon. H. A. Dearborn, Pres. Mass. Hor. Soc.

EXHIBITION OF FRUITS.

Apples. M. P. Wilder of Dorchester, seven varieties Seaver Sweeting, Golden Pippin, R. Greening, a variety of Spitzenburg, Tolman Sweeting, and three varieties names unknown. Wm. Stearns of Salem, monstrous Pippin. James Read of Roxbury, monstrous Pippin. James S. Floyd, a very large apple, not at maturity, name unknown. Nathan Chandler of Lexington, New-York Sweeting, Baldwin and blue Pearmain. Charles French of Braintree, a very large yellow sweet apple of fine flavor, a native fruit, keeps till January. J. M. Ives of Salem, Early Summer Pearmain of Cox, very fine. Mr. Manning, Hawthornden, and specimen of the Alexander. Dr. Fiske of Worcester, a very large red striped apple, now ripe, and very fine, name unknown. Mr. ——— monstrous Pippin. Daniel Chandler of Lexington, four varieties of very fine native apples, all of good size and of a red color.

Pears. Dr. Fiske of Worcester, Seckel Pears, and a winter pear, name unknown. William Stearns of Salem, a native pear from Essex, not of superior quality; also Endicot Pears. Mr. Burrell of Quincy, Rushmore's Bonchretien, a large ordinary pear, now ripe. Dr. Elisha Edwards of Springfield, Capiaumont, very fine. Mr. Manning, autumn Bergamot of the Pomological Magazine; also, Surpasse Virgalieu Catillac, a synonyme of the 40 ounce Pear and the Poire de livre, a large, winter baking pear; also, Ronville of the New Duhamel, which some authors have erroneously confounded with the Martin Sire or Ronville of the Old Duhamel: they differ, however, in color and shape, as well as in the time of ripening, in wood and in leaf. Mr. Payne, Heathcot pear, from Madam Gore's, very fine. Herman Livingston, Esq. of New York, St. Michael's, there called Virgalieu. Mr. Dowse of Cambridgeport, a large Bergamot pear from New York. Mr. Vose, Long Green or Mouille Bouche, very fine.

Peaches. Mr. Vose, Orange Clingstones, fine; Mr. Cornelius Cowing, Kenrick's Heath, very large. Mr. Ebenezer Weld of Roxbury, a native peach, very large, and of extraordinary quality: this fruit was named by the committee Weld's Freestone. Mr. Manning, Columbia peach, No. 10 of Cox.

Plums. Sam. Pond, the Suisse or Semiana plum.

Grapes. Mr. Cornelius Cowing of Roxbury, Isabella and White Chasselas or Sweet Water. Mr. Samuel Pond of Cambridgeport, fine specimens of Catawba, Isabella and Pond's Seedling. Mr. William Kenrick, Blue Elsenburg, a very small, sweet native grape. Dr. S. A. Shurtleff, White Chasselas, fine; and Isabellas. Mr. Vose, White Chasselas, Royal Chasselas, Musk Chasselas, Chasselas of Thomery, Chasselas of Fontainebleau, Black Cluster, Large Frankenthal and Gros Maroc, all produced in open culture.

Melons. Thomas Mason of Charlestown, Pine apple melons, and white skin and green flesh. From Gen. Sumner, Sois, A. from the town of that name in France. WILLIAM KENRICK.

Thomas Rotch of Philadelphia, was admitted a Corresponding Member of the Mass. Hor. Society. Col. N. Towson, President of Washington Hor. Soc. and Joseph Gales, Jr. Esq. Vice President of the same, were elected Honorary Members.

In a former No. it was said that John Winthrop, Esq. of Charleston, S. C. was chosen a Corresponding Member of the M. H. S. It should be, Joseph.

For Exhibition of Flowers, See page 102.

From the Salem Register of the 28th ult.

ESSEX CATTLE SHOW, &c.

THE Annual Exhibition, by the Essex Agricultural Society, was at New Rowley, on Thursday last. The day was highly favorable, the assemblage of people unusually large, and the whole of the movements indicated a continued and increasing interest in the objects of the Society.

The Exhibition, in some of its parts, was well sustained;—in others, it fell short of some former years.

The Ploughing Match was spoken of by all as exceeding any thing of the kind they had ever witnessed. Nineteen teams, ten double, and nine single, were engaged in the competition. The ploughs used were of an improved structure—the cattle were well trained—and the work was well done. One fifth of an acre of land was ploughed by the double teams, in times varying from 37 to 58 minutes. The same quantity of land was ploughed by the single teams in times varying from 55 to 90 minutes.

The stock exhibited was not so numerous or so good as it should have been—though among the number were some fine animals.

We noticed among those entered for premiums: 4 Bulls, 5 Bull Calves, 3 Milch Cows, 2 Heifers, 12 pairs of Steers, 6 parcels of Swine, 20 young Horses, several of them being very promising animals.

In the Hall, for Domestic Manufactures, there were about 80 entries, of articles of different kinds, for which premiums are offered—many of them discovering much taste and skill in their structure.

Claims for the Premiums offered for the Management of Farms, for the cultivation of Mulberry Trees, and the making of Silk, for the cultivation of Rye, &c. were entered, and will be determined on, as soon as the committees have had opportunity sufficiently to examine the subjects.

The first premium for an experiment in turning in Green Crops as a manure, was awarded to Daniel P. King, Esq. of Danvers—and an interesting Report on this subject was submitted by Judge Cummins of Salem.

Dr. Jeremiah Spofford, of Bradford, delivered a sensible, instructive and well written Address;—which together with the Reports of Committees, and other doings of the Society, were ordered to be published.

A large number of the Society, with many invited guests, dined together at a table furnished in the best manner by Col. Savary. The Society have every reason to be satisfied with the unremitting exertions of this gentleman for their accommodation; and are also under great obligations to the ladies of the vicinity, for their kind attention and taste displayed, in ornamenting the tables with a rich profusion of delicate fruits and splendid flowers.

Among the Premiums awarded, were the following:—

To Daniel Putnam of Danvers, for best butter, \$7
To Wm. Tenny, for 2d best do. 5
To Richard Heath of West Newbury, for best cheese, 10
To Wm. Thurlow, of do. for 2d best, 8
To Daniel P. King of Danvers, for an experiment in turning a crop of Buck Wheat as a manure, 20

PLOUGHING—with a double team.

To Silas Moulton of W. Newbury, 1st premium, 12
To Paul Dole of Rowley, 2d do. 10
To Ralph H. Chandler, of Andover, 3d do. 8
To Moses Pettingill of Topsfield, 4th do. 6

PLOUGHING—with a single team.

To Robert Jewett of Rowley, 1st premium, 10
To John Brockleband, of do. a lad aged 13 years, 2d do. 8
To Jona. Kimball of Bradford, 3d do. 6
To George W. Winslow of Danvers, 4th do. 4
To Amos Kimball of Boxford, for a barrel of CIDER of very superior quality, 1st prem. 15
and for the cider to be used at table, 10
To E. & S. Follansbee of West Newbury, for POTATOES raised from the seed, 7
To Ahira Putnam of Danvers, 2

ANIMALS—Bulls.

To Gideon Currier of Newbury, 1st premium, 15
To Harrison B. Spofford of Rowley, 2d do. 10
To Hector Coffin of Newbury, 3d do. 5
To Bailey Loring of Andover, a gratuity, 3

Milch Cows.

To John Kent of Newbury, 1st premium, 15
To Parker M. Dole, of do. 2d do. 10
do. of do. 3d do. 5
To Moses Newell of W. Newbury, for a handsome 3 year old heifer, 5

Steers—3 years old.

To Jedidiah H. Barker of Andover, 1st prem. 10
To Daniel Adams, 3d. of Newbury, 2d do. 5

Steers—2 years old.

To Hector Coffin of Newbury, 1st premium, 5
To Harrison B. Spofford of Rowley, 2d do. 3

Swine.

To Ralph Dole of Rowley, for best boar, 1st premium, 5
To Henry Mowatt of Newbury, for 2d best, 3
To Uriah Bailey of W. Newbury, for best pigs, 1st premium, 6
To James Stevens, Jr. of Andover, for 2d best, 3

Horses, between 3 and 5 years old.

To Thomas Marshall of Newbury, 1st prem. 10
To David Mighill of Rowley, 2d do. 8
To Nathaniel Smith of Danvers, 3d do. 6
To Daniel Hale of Byfield, 4th do. 4

DOMESTIC MANUFACTURES—Premiums.

Mrs. Mary Pettingill, Newbury, carpeting, \$5
Mrs. Susan Kimball, Boxford, do. 3
Mrs. Peter Parker, Bradford, stair carpeting, 3
Mary Ann Davenport, Newburyport, hearth rugs, 3
Mrs. Ann Dole, W. Newbury, 2d premium do. 2
Wm. and Eben. Sutton, Danvers, flannel, 1st pr. 4
Mrs. Betsey Jaques of Newbury, for 4 pairs worsted hose, 2
Mrs. Judith Colby of W. Newbury, aged 84, 4 pairs woollen half-hose, 1
Mrs. Susan Kimball of Boxford, linen cloth, 2
Miss Sarah Johnson of Andover, counterpanes, 4
Miss R. H. Brown, New-Rowley, do. 2
Miss Mary L. Brown, Newburyport, aged 13 years, for an elegant wrought lace cape, 3
Miss Sarah D. Smith, of W. Newbury, for a lace veil, 2d premium, 2
Best specimen of work by a child under 12 years.
Miss Susan H. Hodge, Newburyport, for a bead bag and bead purse, 3
2d premium under same head to Sarah Carey Brown of Newburyport, aged 11 years, 2
Gratuities.
Charles H. Coffin of Newburyport, for imitation wrought shell combs, 3

Win. Tyler, jr. Boxford, 1 pair ladies' walking Shoes, 1
Charles Fields of Rowley, for highly finished calf skins, 2
John Kimball of Rowley, do. 1
To same for chaise leather, 1
Same for buffed horse hide, 1
Wm. Blackburn of Boxford, for excellent wick yarn, 1
Miss Mary A. Burnham of Ipswich, for the best specimen of milk weed manufacture, 1
Miss Frances C. Crosby of Amesbury, in her 8th year, for 60 yards straw braid, 2
Miss Sarah S. Adams, New Rowley, aged 6 years, for a lace cape and handkerchief, 2
Miss Lois Elizabeth Kimball, Ipswich, in her 6th year, for a collar and cape, 1
Abigail F. Barker of Andover, aged 9 years, for various specimens of work, 1
Mrs. Hector Coffin of Newbury, for a pair of excellent thread gloves, knit while riding in a chaise, 1
Miss Margaret Smith, Newburyport, aged 13, for bead bag, 1
Misses Mary and Lois C. Lord of Ipswich, an ingenious paper basket, 1
Miss Lucretia H. Miltou, Newburyport, bead bag and belt, 1
Miss Abigail L. Davis, Newburyport, bead bag and purse, 1
Miss Mary A. Burnham, Ipswich, for a beautiful and ingenious vandyke, made from the feathers of the Guinea hen, 2
Miss Lucy J. Moseley, Newburyport, for beautiful lamp mats and stands, 1
Mrs. Mary Kimball, for a sample of linen table cloth, 1
Thomas Dole of Newbury, deprived of one arm, for an ingenious device, by which he can use a scythe and axe with as much effect as others with two arms, 1
Mrs. Bishop, Newburyport, for a very fine pair merino hose, 1
Miss Mary B. Cornell, Newbury, 6 years old, for a quilt, 1

From the Genesee Farmer.

WHEAT.

I HAVE seen several statements of large crops of wheat from different parts of the country published in agricultural papers; but as yet, few such have been furnished from this, which we consider one of the best wheat growing towns in this county.

On the 29th of July I forwarded to you the number of sheaves which I had harvested from one bushel sowing red chaff wheat. As I have thrashed them, I now send you the quantity which they produced, viz: sixty-seven bushels. To say the quality was fine, would be superfluous.

Mr. C. Hall had a piece of twelve acres which gave fifty-four bushels per acre. Mr. Hall's was the red chaff wheat.

Another neighbor of mine sowed two bushels of the Beaver dam wheat, from which he harvested and cleaned one hundred and sixty bushels.

RAWSON HARMON.

Wheatland, Sept. 21st, 1833.

NOTE BY EDITOR OF GEN. FARMER.

Wheatland in Earnest.—The statement of General Harmon is entitled to the fullest confidence. We saw the field of Mr. Hall before it was gathered, and gave our opinion that part of the field would produce, at least, fifty bushels per acre.

If Mr. Hall and the other gentleman alluded to would furnish us for publication all the particulars respecting the soil on which the crops were raised, the previous situation, and manner of preparation, sowing, &c. they would render an essential service to the agricultural part of community.

We are informed that General Harmon and his five brothers have raised, the past season, more than eleven thousand bushels of wheat. If we go upon the principle that every farmer in western New York ought to make his wheat crop clear, in the common course of farming, then this family are making rather a comfortable business of it.

This exposition brings up the inquiry which we have before made—"what are the lands in this section of country worth?"

If Mr. Hall's lands gave him fifty-four bushels wheat per acre, and we deduct ten bushels per acre for cultivation, then we have forty-four bushels for profit, which sold at ninety-four cents per bushel, the present price in this market, then we have fifty dollars and twenty-six cents as the annual nett profit of an acre, or the interest of more than seven hundred dollars. Allowing that but one-third of a farm could be cultivated for wheat the same year, and the other was entirely useless for the two years it lay uncropped, then such farms would pay the interest upon the whole, at the rate of two hundred and thirty-three dollars per acre.

THE CHASSEUR ANTS AND THEIR PREY.

ONE morning my attention was arrested at Laurel Hill, (Trinidad,) by a number of black birds whose appearance was foreign to me; they were smaller, but not unlike an English crow, and were perched on a calabash tree near the kitchen. I asked D. who at that moment came up from the garden, what could be the cause of the appearance of so many black birds. She said, "Misses, dem be a sign of the blessing of God; de are not the blessing, but only de sign, as we say, of God's blessing. Misses, you'll see afore noon time, how de ants will come and clear de houses." At this moment I was called to breakfast, and thinking it was some superstitious idea of D.'s, I paid no further attention to it. In about two hours after this, I observed an uncommon number of chasseur ants crawling about the floor of the room; my children were annoyed by them, and seated themselves on a table, where their legs did not communicate with the floor.

They did not crawl upon my person, but I was now surrounded by them. Shortly after this the walls of the room became covered by them, and next, they began to take possession of the tables and chairs. I now thought it necessary to take refuge in an adjoining room, separated only by a few ascending steps from the one we occupied; and this was not accomplished without great care and generalship; for, had we trodden upon one, we should have been summarily punished. There were several ants on the step of the stair, but they were not near so numerous as in the room we had left; but the upper room presented a singular spectacle; for not only were the floor and walls covered like the other room, but the roof was covered also.

The open rafters of a West India house at all times afford shelter to a numerous tribe of insects, more particularly the cockroach; but now their destruction was inevitable. The chasseur-ants, as if trained for battle, ascended in regular thick files to the rafters, and threw down the cockroaches to their comrades on the floor, who as regularly

marched off with the dead bodies of cockroaches, dragging them away by their united efforts with amazing rapidity. Either the cockroaches were stung to death on the rafters, or else the fall killed them. The ants never stopped to devour their prey, but conveyed it all to their store-house. The windward windows of the room were glass, and a battle now ensued between the ants and the jack-spaniards on the panes of glass. The jack-spaniard may be called the wasp of the West Indies: it is twice as large as a British wasp, and its sting is in proportion more painful. It builds its nest in trees and old houses, and sometimes in the rafters of a room. The jack-spaniards were not quite such easy prey, for they used their wings, which not one cockroach had attempted. Two jack-spaniards, hotly pursued on the window, alighted on the dress of one of my children. I entreated her to sit still, and remain quiet. In an almost inconceivably short space of time, a party of ants crawled upon her frock, surrounded, covered the two jack-spaniards, and crawled down again to the floor, dragging off their prey, and doing the child no harm. From this room I went to the adjoining bed-chamber and dressing-room, and found them equally in possession of the chasseurs. I opened a large military chest of linens, which had been much infested; for I was determined to take every advantage of such able hunters; I found the ants already inside; I suppose that they must have got in at some opening at the hinges. I pulled out the linens on the floor, and with them hundreds of cockroaches, not one of which escaped.

We now left the house, and went to the chambers, built at a little distance; but these also were in the same state. I next proceeded to open a store-room at the other end of the house, for a place of retreat; but to get the key I had to return to the under-room, where the battle was now more hot than ever: the ants had commenced an attack upon the rats and mice, and, strange as it may appear, they were no match for their apparently insignificant foes. They surrounded them, as they had the insect tribe, covered them over, and dragged them off with a celerity and union of strength, that no one who has not watched such a scene can comprehend. I did not see one mouse or rat escape, and I am sure I saw a score carried off during a very short period.

We next tried the kitchen—for the store-room and boy's pantry were already occupied; but the kitchen was equally the field of battle, between rats, mice, cockroaches, and ants killing them. A huckster negro came up selling cakes, and seeing the uproar, and the family and servants standing out in the sun, he said—"Ah, Misses, you have got the blessing of God today, and a great blessing it be to get such a cleaning." I think it was about ten when I first observed the ants; and about 12 the battle was formidable; soon after one o'clock the great strife commenced with the rats and mice; and about three the houses were cleared. In a quarter of an hour more the ants began to decamp, and soon not one was to be seen within doors, but the grass round the house was full of them; and they seemed now feasting on the remnant of their prey, which had been left on the road to their nests; and so the feasting continued till about four o'clock, when the black birds, who had never been long absent from the calabash and pois deux trees in the neighborhood, darted down among them, and destroyed by millions those who were too sluggish to make good their retreat. By five

o'clock the whole was over; before sun-down the negro houses were cleared out in the same way; and they told me they had seen the black birds hovering about the almond-trees close to the negro houses as early as seven in the morning. I never saw these black birds before or since; and the negroes assured me that they never were seen, but at such times.—*Mrs. Carmichael's Domestic Manners and Society in the West Indies.*

TREES.

SINCE a growing attention has been manifested in this city, and other places also, to the cultivation of ornamental trees, we take occasion to invite the public attention to the Ailanthus trees, fronting the Messrs. Thorburn & Son's establishment in Liberty-street. All who behold must admire them for their luxuriant growth and graceful oriental foliage. We should admire much to see those trees freely introduced in our streets; a work which can very easily be done, since their growth is very rapid. They are as hardy as hickories, and are never marred by vermin—being always clean and tasteful as those of which we are speaking at this moment. They are called in China, their native country, the "Tree of Heaven," from their stateliness and graceful beauty. Their cost is not greater than the horse chesnut, and the Messrs. Thorburns have a fine supply.—*N. Y. Commercial.*

TO PRESERVE WINTER APPLES SOUND.

AFTER the fruit has arrived to perfect maturity, gather it by hand from the tree, in dry weather; select the finest, wrap them carefully in paper, and place them in fresh barrels in a dry cellar. The barrels should be tightly headed. Or, after the barrel has been carefully filled with apples *without* the wrapper, pour over them dry sand from a brick yard until the barrel is filled; the sand will easily find its way to the bottom and completely fill the crevices. We have tried both ways with much success, but prefer the former, as it is difficult perfectly to remove the sand from the apples preserved in it, which renders their effect upon the teeth somewhat like Mr. Chandler's "grind-stone apples." We have now, perfectly sound apples of last year's production, which have been kept in papers. The paper of the Messenger, we think, is admirably adapted to this purpose; and those of one year's subscription would be sufficient to paper a barrel of apples, and would in this way alone amply compensate the subscriber.—*Crawford Messenger.*

ON THE FLOWERING OF VINES.

IT is often observed that healthy and vigorous growing vines, even in favorable seasons, never produce any, or but very little fruit. This is sometimes occasioned by the plants producing only male flowers, and in these cases the anthers are sessile, or if the filaments are present the anthers are wanting. A second cause of this failure is, when only female organs are developed, which, however, are sometimes impregnated by insects with the pollen of other vines, and therefore produce berries only very sparingly. A third, and very prevalent cause is, when the calyx opens on the top and forms a basin, which retains water about the organs of impregnation, and thereby hinders them from performing their respective functions. All such plants should be either destroyed entirely, or grafted from a free bearing vine that flowers perfectly.—*Gardener's Magazine.*

HORTICULTURAL.

EXHIBITION OF FLOWERS AT THE MASS.
HORT. SOC. ROOMS.

Saturday October 5, 1833.

E. Putnam, Salem, Dahlias—French white, Præcellentissima, Kentish Hero, Puleu, Clustered purple, Very double iron red globe, Crimson globe, Royal lilac, Star of Brunswick, Superb straw, Lord Lyndhurst, Queen of Yellows, Coquette, Inwood's Donna Maria, Young's Pauline, Miss Hester, Prince's transcendant, Large pink anemone, Brown do., Neat crimson globe, Antonio, Queen of Naples, Nuttallii, Douglass' Augusta, Cree's purpurea variegated, Queen of August, Imperiosa, Young's Venus beau, Early blood red anemone, Romulus, Black Prince, Small crimson anemone (but undoubtedly marked wrong as it is a large variety), Scarlet anemone, Lady Grantham, Leonard's Prize, Preciosa, Royal Augustus, Countess Plater, Young's Rose, Theodore, Straw and purple, American dwarf, Double buff, Profuse lake, Dwarf lilac, New blush, Small double white, Great flowering lilac, Tenuifolia, Excellent, Royal sceptre, Panoply, Young's aurora, Morning star, Pizarro, Barrall's Susannah, Dennissii, Grantchester nonpareil, Aurantia speciosa, Painted lady, Douglass' coronation, Constantia rosen, Countess of Liverpool, Purple prince, American giant, Craft's maroon, Henrietta, Goliah, Seedlings raised this year, Putnam's Princess of Naples, do. Beauty of Salem, and 10 others—80 varieties.

Wm. Carter, Botanic Garden, Cambridge,—Dahlias: Sans viscen, King of the Whites, Imperiosa, Romulus, Squibb's pure yellow, &c. &c. Lobelia splendens and celestina, Erythrina crista galla, with many other varieties of new productions.

William Kenrick, Newton,—Dahlias, Altheas, Chorchorus, Snowberries, China Roses, &c. &c.

Thomas Mason, Charlestown Vineyard, varieties of Dahlias.

S. Walker, Roxbury, Dahlias, &c.

Messrs. Winship, Dahlias and other flowers.

The Show of Flowers, more particularly of Dahlias, this day, was more splendid, than ever before exhibited at the Society's rooms, or probably in the Country; among them the *Beauty of Salem* is unrivalled. By order of the Committee.

JONA. WINSHIP, Chairman.

For PROCEEDINGS, FRUITS exhibited, &c., see p. 99.

BRISTOL CO. AGRICULTURAL SOCIETY.

THE Annual Exhibition of this Society was holden in Taunton, on Wednesday last. The number and variety of articles presented, is said to be less than usual, owing, probably, to the inclemency of the weather. More than \$250 were awarded in premiums. A premium of \$4 was awarded to Messrs. N. & J. C. Dodge, for the best piece of Sheeting. There were sixteen yoke of Oxen and one yoke of Steers offered for exhibition. The ploughing match possessed unusual interest—twelve teams appeared as competitors on the ground.

The following is a list of officers chosen for the ensuing year:

President.—Marcus Morton.

Vice Presidents.—Roland Green, Horatio Leonard, James Starkweather, Peter Thatcher.

Recording Secretary.—Sidney Williams.

Corresponding Secretary.—James L. Hodges.

Treasurer.—William A. F. Sproat.

Committee of Publication.—James L. Hodges, Jacob Chapin, Horatio Pratt.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 9, 1833.

CATTLE SHOW AT BRIGHTON, IMPROVEMENTS IN AGRICULTURE, &c.

THERE is nothing more thoroughly established by the infallible test of experience than the fact that agricultural societies and exhibitions are productive of great benefit to the public, as well as to the individuals, who are concerned, or take an interest in their proceedings and displays. Indeed, it would seem to those who have attended to this subject, almost as unnecessary to attempt showing that improvements in every branch of husbandry have been the results of these exhibitions, as to make elaborate essays and efforts to convince mankind that the sun is the source of daylight. Yet, we apprehend that many, who have some vague and indistinct ideas of good resulting from Cattle Shows, are not aware how deeply mankind are indebted to these and other means of improving the art and science of cultivating the earth. We will, therefore, adduce one or two instances, which may serve as samples of the benefits derived from the abovementioned and other similar sources.

In an English work called "The Picture of London," published in 1822, it is stated that "about the year 1700, the average weight of oxen, killed for the London market, was 370 pounds; of calves, 50 pounds; of sheep, 28 pounds; and of lambs, 18 pounds. The average weight at present is—of oxen 800 pounds, calves 140 pounds, sheep 80 pounds, and lambs 50 pounds." This addition to the average size of domestic animals has been accompanied with corresponding improvements in the quantity and quality of the crops necessary for feeding and fattening them for market. These are among the beneficial effects of associations similar to that, which will hold its annual exhibition at Brighton on the 16th inst.

Through the instrumentality, and under the patronage of the Board of Agriculture, in Great Britain, and a great number of other societies, together with many able and well supported agricultural publications, the progress of the art of arts, during the latter part of the last, and since the commencement of the present century, has been more rapid than during the whole of several centuries immediately previous to that period. The first men of Great Britain, whether we have reference to to rank, influence, wealth or intellect, devoted their time, talents, means and money, to further the high behests of an art, without which man would be a savage and the world would be a wilderness.

Among the great and good men, who towards the close of the last century, distinguished themselves in Great Britain in the promotion of agriculture, may be named the Rev. Adam Dickson, Lord Kames, Dr. Anderson, Dr. Hunter, an association of gentlemen who published the Complete Farmer, Brown, Bannister, Arthur Young, Sir John Sinclair, founder of the British Board of Agriculture, and many others, whose names and good deeds will never be forgotten "while grass grows and water flows." Their mantles have fallen on worthy successors, too numerous to be named in this sketch, but whose merits are legible on the fair and fruitful surface of a country con-

verted by their instrumentality into a garden almost coextensive with its surface.

In the United States, Agricultural Societies have been very efficient in producing improved husbandry, with its consequent blessings pervading every grade and department of the community. "The honor of introducing into the State those important engines of Agricultural improvement, Cattle Shows, and a high honor it is, belongs to the County of Berkshire, where the first Cattle Show was held in the year 1814. The first Cattle Show held at Brighton was in October, 1816. At present there is not a County in the State without its Agricultural Society, and its Cattle Show, with the exception of the County of Norfolk, and the four Counties of Suffolk, Barnstable, Dukes and Nantucket, which consist principally or wholly of maritime towns."

To recapitulate all the improvements, which have been derived directly, or indirectly from these societies, would require volumes. Able sketches of these improvements have been given by the gentleman, from whose Address the above was quoted, as well as by other gentlemen who have from time to time addressed the same Society. We cannot, however, forbear adverting to one or two other items of improvements, abstracted from Mr. Gray's Address. It appears that the profit, resulting from improved breeds of swine, several years previous to 1830, was estimated by the most competent judges at not less than one hundred thousand dollars per annum. That a million of dollars has been added in a few years to the annual revenue of New England by improvements in the breeds of sheep. Other statements of Mr. Gray, relating to improved breeds of cattle, might be here introduced, but it is not necessary to enlarge on points relative to which no dispute can exist.

Agricultural exhibitions present the most powerful excitements to industry, and improvements in husbandry, which any community can bestow on individuals for having deserved well of their country. The fruits and effects of skill and diligence, by the means which these shows present, enable the exhibitor and producer to the double reward of fame and money; two great objects of human pursuit, and the most powerful incentives to human exertion. The Premiums given by the Massachusetts Society for Promoting Agriculture, are, we believe, considerably larger than are afforded by any other similar society in the Union. The reputation to be acquired in this field of competition will also be greater, or at least more widely extended than could be hoped for in similar efforts, under the auspices of agricultural associations of more limited resources. The motives for excellency in the many branches of culture for which this Society offer its rewards are stronger, and it is hoped will prove more efficient than can elsewhere be found on this side the Atlantic.

It may not, perhaps, be known, or not occur to the minds of some, whose influence and example might increase the interest of agricultural exhibitions, and add to the utility of agricultural societies, that Gen. Washington was not only an excellent scientific and practical farmer, but an advocate for Agricultural Societies. His observations on this subject are as follows:

"It will not be doubted, that with reference either to individual or national welfare, agriculture is of primary importance. In proportion as nations advance in population and other circum-

stances of maturity, this truth becomes more apparent, and renders the cultivation of the soil more an object of public patronage. Institutions for promoting it, grow up, supported by the public purse: and to what objects can it be dedicated with greater propriety? Among the means which have been employed to this end, none have been attended with greater success than the establishment of Boards, composed of proper characters, charged with collecting and diffusing information; and enabled by premiums and small pecuniary aids, to encourage and assist a spirit of discovery and improvement. This species of establishment contributes doubly to the increase of improvement, by drawing to a common centre the results, every where, of individual skill and observation, and spreading them over the nation. Experience accordingly has shown, that they are very cheap instruments of immense national benefit."

There are some attractions to the exhibition at Brighton on the 16th inst. of a peculiar and powerful nature. The season has been bountiful, the premiums of the Society liberal, and we may anticipate a rich intellectual repast in the Address of the Hon. EDWARD EVERETT, whose reputation as an Orator, and a man of erudition, give us a guaranty of excellence of the highest order. If the above-named inducements and many others which might be enumerated, should fail to make the Brighton Show all that the most sanguine could anticipate, we shall fear that the best interests of the good old "Bay" State are beginning to be nullified, in consequence of the supineness of those to whom Providence has entrusted the custody of her weal and welfare—the guardianship of her public as well as her private prosperity.

ITEMS OF INTELLIGENCE.

Improved Corn. Dr. Oliver Fiske, of this town, has left with us a specimen of Corn of a kind which he has raised for three years past, and which appears worthy of the attention of our farmers, generally. It has now been fully ripe for near a month, and being thus early, it is not only safe from the frost, but, in consequence of filling out and ripening in the warmer part of the season, is more likely to be sound and heavy than that which ripens later. The kernel and ear are about the size of the common corn, and Dr. Fiske thinks it will yield as large a crop as any corn he ever raised.—*Worcester Spy.*

Live Stock. The Memphis Advocate of the 4th inst. states that on the 1st the steamboat Lady Franklin passed that place with a cargo of FIFTEEN THOUSAND CHICKENS, and an almost unprecedented number of other live stock, bound for the New Orleans market.

The Hon. Daniel Webster has accepted an invitation from the Franklin Institute of Philadelphia, to deliver in that city an Address before that body, in the last week of November next.

The Season. It is a subject of some curiosity to note the difference in the season in different latitudes. The Quebec Gazette of Sept. 16, mentions that for four or six days the weather had been cold, with frosts almost every night. This had prevented some of the crops from ripening. With the exception of oats, however, the crops of grain were then under the sickle!—*Worcester Spy.*

FARMER'S OWN BOOK.

For sale at the New England Farmer office the Farmer's Own Book or Family Receipts. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 50 cents.

HERDS GRASS, CLOVER, RED TOP. Of the growth of 1833 and of good quality. ALSO—Flax and Hemp seed, for which cash will be paid. oct9

NEW ENGLAND FARMER ALMANAC FOR 1834.

JUST published and for sale by Geo. C. Barrett, No. 52 North Market street. The New England Farmer's Almanac, for 1834, by T. G. Fessenden, editor of the N. E. Farmer.—Astronomical calculation by R. T. Paine, Esq. Dealers supplied on liberal terms. oct9

SITUATION WANTED,

BY an experienced Gardener; one who thoroughly understands the propagation of Green House Plants, Grape Vines, &c.—Good reference as to character and capability can be given. Apply at this office. tf oct9

GREEN HOUSE GLASS.

LORING, & KUPFER, No. 10 Merchants Row, have on hand a very large supply of thick Glass suitable for Green Houses and Factories. Also Plate Glass of a superior quality and thickness, with other descriptions of Window Glass, all Sizes, in large or small quantities, at the lowest prices. 1m sept18

WANTED.

IN the vicinity of Boston, an experienced Gardener, thoroughly acquainted with the propagation and care of Green House Plants, and the management of Vineries, to whom the highest wages will be paid—satisfactory information, as to capacity and character, will be required. Apply at this office. sept25

TREES, SEEDS, PLANTS, &c.

THE Subscriber having been regularly bred to the business of Horticulture, &c. in England, and having resided in, and visited different parts of the U. States—considers himself fully qualified to select any thing in the line—as he has business that will call him to England the first of November, he will undertake to select and see personally to packing and shipping to any part of the U. States any thing that may be requested in his line for a small commission. The most respectable references given as to character and capacity. Please address communications to the care of Messrs. G. THORNBURN & SONS previous to Nov. 1. JOSEPH LODGE. oct2

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug14

LINNEAN BOTANIC GARDEN AND NURSERIES.

Flushing, near New York.

WILLIAM PRINCE & SONS announce to the public that, from the immense extent of their establishment, they are enabled to furnish such trees of the various kinds, as cannot fail to give satisfaction, by their superior size, vigor, &c.,—and their Nurseries at present contain more than a million of trees and plants in the most thrifty state. Among these are above 50,000 pear trees, of 3 and 4 years' growth from the graft, comprising the most choice new Flemish and other varieties of modern origin. Their new catalogues with the reduced prices, will be forwarded to every applicant, and are as follows:—

- No. 1. Fruit and hardy Ornamental Trees, Shrubs and Plants. pp. 93.
2. Bulbous and Tuberous rooted Plants and Dahlias, &c. pp. 24.
3. Greenhouse Trees, Shrubs and Plants. pp. 44.
4. American Indigenous Trees, Shrubs and Plants. pp. 50.
5. A catalogue of Vegetable, Field, and Flower seeds.

To the Proprietors of Nurseries, and to those who may wish to establish new Nurseries, they will furnish all articles desired, at a liberal discount and a convenient credit; and in all other cases where large quantities are wanted, a reasonable abatement will be made. They will also supply all vendors of seeds, and those who wish to engage in that business, with every variety of Vegetable, Field and Flower seeds, at very low rates. These seeds possess the advantage of being raised under their own observation, or when imported, of being tested to their satisfaction, and their accuracy and vitality are expressly guaranteed. Many new and choice kinds will be found in the catalogue, which have never before been offered to the public. The collection of Bulbous flower roots and Dahlias is particularly rich and extensive, and of the latter, they have a specimen bed covering an acre of ground, and comprising 600 varieties now in full splendor. Bulbous roots and Dahlias are easily transported, and can be vended in a dry state, in seed Stores, &c. and an establishment for the sale of these articles ought to exist in every town in the Union. It will be readily perceived, that the great number of trees, &c., always in the Nurseries, enables the proprietors to make superior selections, and secures to all applicants this particular advantage.

As it is deemed unnecessary to continue any Agency at Boston, it is requested that all orders be sent direct per Mail, and the utmost attention will be paid to forwarding them agreeably to order. oct2

BRIGHTON MARKET.—MONDAY, OCT. 7, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 2325 Beef Cattle, 170 Stores, 3800 Sheep, and 750 Swine.

PRICES. Beef Cattle.—The best qualities of cattle were very plenty at market, and sales were made at prices something less than they were last week, for the same quality. We quote a few very fine at \$5 50; prime at \$5 a 5 25; good at \$4 50 a 4 75; thin, and Steers and Cows at 3 25 a 4 25.

Barrelling Cattle.—No prices appear yet to be settled for barrelling Cattle. A number of large lots were taken before they arrived at Brighton, at prices varying from \$3 75 to 4 25; among the lots were some very thin, and some Market Cattle.

Cows and Calves. Sales at 16, 23, 26, and \$30.

Stores.—Yearlings \$7 75 a 11; two year old 11 a 15.

Sheep.—Lots were taken at \$1 33, 1 40, 1 50, 1 75, 1 84, 1 88, 2 00, 2 08, 2 17, 2 25, and 2 33.

We noticed some fine Wethers sold, but did not obtain the price. **Swine.**—One lot, two thirds Barrows, were taken for a fraction short of 44. Several lots more than half Barrows, at 4 1-4. One lot, inferior, at 3 1/2. At retail, and in very small lots, 4 a 5 for Sows, and 6 a 6 for Barrows—prices varying with the quality and size.

MISCELLANY.

[From the Token and Atlantic Souvenir, for 1834.]

WHY DON'T HE COME?

BY H. F. GOULD.

THE ship has anchored in the bay!
They've dropped her weary wings, and some
Have manned the boats and come away;
But where is he? why don't he come?

Among the throng, with busy feet,
My eye seeks him it cannot find:
While others haste their friends to greet;
Why, why is he so long behind?

Because he bade me dry my cheek,
I dried it, when he went from us—
I smiled with lips that could not speak;
And now, how can he linger thus?

I've felt a brother's parting kiss,
Each moment since he turned from me,
To lose it only in the bliss
Of meeting him—where can he be?

I've reared the rose he bade me rear—
I've learned the song he bade me learn,
And nursed the bird; that he might hear
Us sing to him, at his return.

I've braided many a lovely flower,
His dear, dear picture to inwreath,
While doating fancy, hour by hour,
Has made it smile and seen it breathe.

I wonder if the flight of time,
Has made the likeness now, untrue;
And if the sea or foreign clime,
Has touched him with a darker hue.

For I have watched until the sun
Has made my longing vision dim,
But cannot catch a glimpse of one
Among the crowd, that looks like him.

How slow the heavy moments waste,
While thus he stays! where, where is he?
My heart leaps forth—haste, brother! haste!
It leaps to meet and welcome thee!

"Thou lovely one! the mournful tale
That tells why he comes not, will make
Thy heart to bleed, thy cheek look pale!
Death finds no tie too strong to break!

"The bird will wait his master long,
And ask his morning gift in vain:
Ye both must now forget the song
Of joy, for sorrow's plaintive strain.

"The face whose shade thy tender hand
Has wreathed with flowers, is changed! but see,
Nor sun nor air of foreign land
Has wrought the change, for where is he?

"Where? ah! the solemn deep, that took
His form, as with their sad farewell
His brethren gave the last, last look,
And lowered him down—that deep must tell!

"But ocean cannot tell the whole—
The part that death can never chill,
Nor floods dissolve—the living soul,
Is happy, bright, and blooming still.

"And nobler songs than e'er can sound
From mortal voices, greet his ear;
Where sweeter, fairer flowers are found
Than all he left to wither here.

"This, this is why he does not come,
Whom thy fond eye has sought so long?
Wait till thy days have filled their sum;
Then find him in an angel throng!"

From Locke's Miscellaneous Papers.
THUS I THINK.

It is a man's proper business to seek happiness and avoid misery. Happiness consists in what delights and contents the mind; misery in what disturbs, discomposes or torments it.

I will, therefore, make it my business to seek satisfaction and delight, and avoid uneasiness and disquiet; to have as much of the one, and as little of the other as may be.

But here I must have a care I mistake not; for if I prefer a *short* pleasure to a *lasting* one, it is plain that I cross my own happiness. Let me then see wherein consists the most lasting pleasures of this life, and that, as far as I can observe, is in these things:

1st, Health—without which no sensual (as opposed to intellectual) pleasure, can have any relish.

2d, Reputation—for that I find every body is pleased with, and the want of it is a constant torment.

3d, Knowledge—for the little knowledge I have I find I would not sell at any rate, nor part with for any other pleasure.

4th, Doing good—for I find the well cooked meat I eat to-day, does now no more delight me; nay, I am diseased after a full meal; the perfumes I smelt yesterday, now no more affect me with pleasure; but the *good turn* I did yesterday, a year, seven years since, continues *still* to please and delight me, as often as I reflect on it.

5th, The expectation of eternal and incomprehensible happiness in another world, is that also, which carries a constant pleasure with it.

If, then, I will faithfully pursue that happiness I propose to myself, whatever pleasure offers itself to me, I must carefully look that it cross not any of those five great and constant pleasures above mentioned. For example, the fruit I see tempts me with the taste of it that I love; but if it endanger my health, I part with a constant and lasting, for a very short and transient, pleasure, and so foolishly make myself unhappy; and am not true to my own interest.

Innocent diversions delight me; if I make use of them to rest myself after study and business, they preserve my health, restore the vigor of my mind, and increase my pleasure; but if I spend all or the greater part of my time in them, they hinder my improvement in knowledge and useful arts—they blast my credit, and give me up to the uneasy state of shame, ignorance and contempt, in which I cannot but be very unhappy. Drinking, gaming, and vicious delights will do me this mischief; not only by wasting my time, but by a positive injury endanger my health, impair my parts, imprint ill habits, lessen my esteem, and leave a constant lasting torment on my conscience; therefore, all vicious and unlawful pleasures I will always avoid, because such a mastery of my passions will always afford me a constant pleasure, greater than any such enjoyments, and also deliver me from the certain evil of several kinds, that by indulging myself in a present temptation I shall certainly afterwards suffer.

All innocent diversions and delights, as far as they will contribute to my health, and consist with my improvement, condition, and my other more solid pleasures of knowledge and reputation, I will enjoy, but no farther, and this I will carefully watch and examine, that I may not be deceived by the flattery of a present pleasure to lose a greater.

FRESH FALL GOODS.

ELIAS STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. Merino, a very superior article, and all the most desirable colors, imported expressly for the subscriber—4 cases 3-4 Eng. do. of various colors and qualities—4 cases Circassians, very superior qualities and various colors—1 case superior Goats Hair Camblet—4 bales 4-4 5-4 and 6-4 Bocking, green and mixed—12 bales splendid Tarrifville Hearth rugs—5 bales Eng. low priced do. do.—5 bales Domets, white, yellow, red, &c.—10 bales Flannels, Eng. Welsh, and American—10 bales Cotton Carpeting, striped and blocked—6 bales Russia Diaper—1 bale Canton Flannel, lower than the cost of importation—3 bales American Cotton Flannels, bleached and unbleached—1 bale White Counterpanes, all sizes—10 bales superior London Row Blankets from 10-4 to 14-4—7 bales real Indigo Checks from 3-4 to 5-4—3 bales American Gingham—2 cases Eng. Gingham—29 bales cotton Batting—25 bales Pillisse Wadding, 12 bales black Wadding—5 cases Embossed Furniture Dimety—2 cases Embossed Cambric, for stage lining—20 cases Prints, all patterns and prices, Eng. French, and American—35 cases Bleached Cottons—50 bales unbleached cotton—10 bales Ticking 3-4, 7-8 and 4-4, some very superior quality—2 cases Sinchaws—2 cases Sarsnets—2 cases Satin Levantines, superior quality—3 cases Levantines, low priced—7 cases Crape Dresses, all colors—5 cases Linens, Lawns, and Shirtings 4-4 to 10-4 with a very extensive assortment of Cambrics and Cambric Muslins, Bobbinette and Grecian lace, 4-4 and 6-4 Swiss nousook, Book Jacouett plain and figured muslins—Hosiery and every variety of seasonable Dry Goods.

Country merchants will do well to call and examine for themselves. sept18.

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Ceebels, and from cows of imported stocks. For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. opt18.

BULBOUS ROOTS.

JUST received at the New England Seed Store, 51 & 52 North Market street, one Lot fine Bulbous Roots,—containing Tulips, variety, at 12 1-2 each, or \$1 a dozen; Hyacinths, Dutch, very fine sorts, without names; Polyanthus Narcissus, do. do.; Sweet Scented, do. do. with names. Expect next week an invoice of very splendid Hyacinths, Tulips, &c. &c. aug 14

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If No paper will be sent to a distance without payment being made in advance.

USELESSNESS OF EARTHING UP GROWING CROPS OF POTATOES.

Sir, I WOULD offer a few hints that may aid the endeavors of those who advocate the benefiting of the condition of the poor: they may contribute to increase the objection which some have urged against exhausting the powers of labor. Mr. Knight's observations regarding the potato are valuable; but there is one laborious operation commonly resorted to in cultivating this vegetable, which I think has not been sufficiently considered; and which I am convinced by more than ten years experience, is superfluous. Observing that a farmer, in managing a field of potatoes alongside one of mine, did not earth them up, but simply flat-hoed the surface of the soil to clear away the weeds, while I had mine earthed up with great care, I determined on noticing the difference on taking up the crop; and, to my astonishment, he had 14 tons per acre, while I had not more than half the quantity, and his potatoes were of a more marketable quality than mine; being generally of a good size, while mine were large and small. The result induced me to question the farmer; and he told me it was a practice he had followed for many years, as he thought the earthing up was worse than labor thrown away; that, a year or two before, he had obtained 19 tons per acre by the same management. This statement put me upon considering the principles upon which such a result was founded; and it appeared to me that, by drawing up the earth over the potato, in sloping ridges, it was deprived of its due supply of moisture by the rains; for, when they fell, the water was cast into the ditches. Further, in regard to the idea that, by thus earthing up, the number of tubers is increased: the effect is quite the reverse; for experience proves that a potato placed an inch only under the surface of the earth will produce a greater number of tubers than one planted at the depth of a foot. From reasoning thus, I determined to adopt the practice: however, such is the force of prejudice, that I have been able to make but few proselytes. A year or two since, I prevailed on a clergyman to try the practice on a strip of half an acre, running through a large field, treated in the common manner; and he told me that, on taking up the crop, he did not find much difference in the gross quantity; but that those which had not been earthed up were, more generally, of a good size; not so many large and small as the other part of the field. I have no doubt, if potatoes are planted shallow, and placed wide enough apart to admit of the stems being laid down after the young potatoes are formed, and to have the earth between them thrown over five or six inches thick, so as to form a flat surface, that it would increase the crop. But this is a very different operation from that I object to.

I am, Sir, yours, &c. JOSEPH HAYWARD.

From Loudon's Gardener's Magazine.

PREPARATIONS FOR WATERING PEACH TREES, &c.

Sir, It is well known, that although trees of the peach, apricot, plum, apple, &c. are well furnished

with blossom buds, the blossoms often fail in their impregnation, and fall off; and, when they are impregnated and set, they fall off at the stoning; frequently, although they survive the stoning, they become prematurely ripe and fall off, and very few, if any of the fruit attain maturity; while those which do, become vapid and without flavor. These failures I have proved to be the effect of unwholesome food; and having found a remedy in a simple preparation, I beg the favor of such of your readers as have an opportunity, to make a trial of it, and to state the result. Having selected a tree that is in good condition, and well furnished with blossom buds, just as the blossoms are beginning to expand, take a potato fork, and with it make holes all over the surface of the space occupied by the roots (which extend as far from the stem as the branches), at about 18 inches apart, by forcing in the fork to the full depth of its tines, and giving it a gentle heave, by pressing on the end of the handle; then, having dissolved some nitre in water, (in the proportion of one ounce to three gallons of water,) fill the holes with the solution. No manure much be given; but if, after the stoning of the fruit, the tree should appear to be unequal to sustaining its crop of fruit, the following preparation may be given, in the same manner as the nitre:—To one gallon of blood add one gallon of water and one ounce of potash; stir the mixture well, and let it stand for a week or ten days; then pour off the solution from the clot, and, mixing one gallon of this liquid with four gallons of water, give it to the trees as above. The remaining clot may be dissolved by adding to it one quart of slacked lime and one gallon of water to one gallon of clot; but this solution must not be given to fruit trees, as it will produce the effect which the nitre is intended to remedy. It will, however, prove a good manure for the cabbage tribe, as asparagus, celery, &c. This discovery, which I consider to be of great value, I made some years since; and, as it is not merely accidental, but the result of a regular course of experiments, made with a view of ascertaining the nature and effects of the food of plants, and is founded on physiological and chemical principles, it will, I have no doubt, lead to the establishment of a much more perfect system of manuring than is at present practised.

I am, Sir, yours, &c. JOSEPH HAYWARD.

FRUIT TREES.

IN the cultivation of fruit trees, too little care is exercised in the selection. It should be constantly borne in mind, that the trouble and expense of raising the choice varieties is no greater than is necessary for the most ordinary or inferior; and while the latter are comparatively of little value, the former will always command a ready sale and a good price in the market, and for use are as much to be preferred, as they are for the market. There seems to be a very prevalent opinion, that all late peaches must necessarily be of inferior quality. Those who have paid attention to the subject well know that this opinion is groundless. We have, within a few days past, seen three or four varieties of peaches, which would compare favorably with the best of the early kinds. One,

in particular, a peach cultivated by Dr. Fiske—to whose favorable opinion of our taste we are indebted for specimens—and called by him the orange freestone, is very luscious, and comes up to the *beau ideal* of a good late peach. With such peaches, and the Seckel, St. Michael's and Brown Beurre pears, all of which are now in eating, we hardly know what more a man could wish for, in the way of fruit. We are glad to find that the Seckel pear—the finest in the world—succeeds remarkably well in this vicinity, and that the cultivation of them is extending.—*Worcester Spy*.

From the Observer & Reporter.

BYFIELD HOGS.

SINCE the establishment of Agricultural Societies in our country, great attention has been paid, and large sums expended for the improvement of stock of every description. Hence it is, we have horses and horned cattle equal to the English breeds, and sheep that produce all grades of wool; the Merino and Saxon, not inferior to the Spanish and Saxony wools.

Our hogs have also been greatly improved by a cross of the Chinese and Calcutta breeds. Other descriptions of hogs lately brought to the western country, promise a still greater improvement in the stock of this most valuable animal. They are the *Byfield*, the *Swiss*, and the *Russian*. Of the three, the Russian is less preferable, being small and too fat generally to be prolific or profitable; but when crossed with other stock, a desirable breed is produced, but not equal to the Byfield or Swiss; of these two, time has not yet developed which is best. Mr. Robb of Indiana, gives the preference to the Swiss, while Mr. Bird Smith of Woodford county, who is raising the above named stock, gives the preference to a cross produced through the Byfield and Swiss.

The Swiss hog is a dark brown, lengthy and round bodied, big bone, hair thin and coarse, very prolific and easily kept; weighing from two to three hundred pounds at a year old; at two years old he will weigh from four to five hundred pounds. The Byfield is a beautiful white hog; his ears are small, pointing to the nose; broad back, deep chest, large jowls, short nose, dish face, and thin hair. He was brought from Massachusetts (bred by G. Parsons, Esq.) to the state of Ohio, where his blood is seen mixed through the great variety of breeds of that state, generally producing a stock after his own kind, as well in color as in beauty and size. He is three times as profitable as the common hog, because he will come to maturity in half the time, and will not consume half the food. He is fat from a pig until he is ready for the pickling tub, weighing from 200 to 250 at a year old. Grass being his natural food (as it would seem) he is not so subject to the sore throat, a disease produced by too much grazing, particularly on clover. He is said to undergo the fatigue of driving as well if not better than the common hog. This at first view would appear unreasonable from his bulky appearance; but when we consider that he is never poor, and habituated from a pig to carry his fat, increasing in strength as he increases in weight, he would not be so liable to lag as a hog quickly fattened would be. But

this quality is of less importance, as the completion of the rail road will give a different direction to our pork.

We understand that Mr. Smith intends to exhibit a few of his hogs at the stock fair next Monday. AGRICOLA.

WOOL.

LARGE quantities of Wool continue daily to pass through this village from the "hill towns" to the manufacturing establishments in Worcester county. One load from Worthington last week, which contained upwards of 1900, was purchased at 70, 65½, 55½ cents the different grades. One individual alone in Middlefield, has sold, during the past season, eleven hundred fleeces, at 70 cts. per pound, averaging \$2 each fleece. This gives an income of \$2200 for one farmer from Sheep alone, drawn out from soil which is unfit for every other purpose but grazing. An individual familiar with these matters has said to us, that in most of the towns west of Northampton, more Cash would be obtained for Wool this year, than for every other commodity raised or manufactured there put together.

WASHINGTON COUNTY, PENN. The sales of Wool from Washington county, Pennsylvania, the present season, are estimated at *two hundred and fifty thousand dollars*. Some of the large flocks are in charge of shepherds, whose sole business is to guide and protect them with dog and crook—the only instance in our country, so far as we know, where this primitive occupation is followed. —U. S. Gazette.

MONTHLY STRAWBERRIES.

MR. P. FUREY, gardener, corner of Sixth Avenue and 17th street, is now exposing for sale in front of the Exchange, a great number of the monthly strawberry plants. The culture of this delicious fruit has, within a few years, received the attention of gardeners in this vicinity. We are acquainted with one individual who devotes his whole attention to their culture—has several acres of vines, and notwithstanding the unfavorable season, sold upwards of a thousand dollars worth of berries, the produce of his own garden. We hope Mr. Furey may be well rewarded for his attention to this description of plant.—N. Y. Gazette.

SITUATIONS FOR HOUSES.

WE notice some speculations on this interesting subject, contained in the papers of the Provincial Medical Association, which lead to the result that elevated situations generally do not possess any advantage in regard to healthfulness over those on the adjacent plains. This fact is mentioned as having been proved in regard to country houses in England. The same thing, however, has also been repeatedly observed here, both in the country and in cities. Localities situated on the sides, or even on the summits of hills, and thence possessing the apparent advantage of a free circulation of air, are found, notwithstanding, to exhibit their full proportion of the diseases, endemic and epidemic, which infest the valley and plain beneath. The cause of this anomaly is probably various. In some places, it would seem that in the original conformation of the soil, lands situated as we have mentioned were drains to the ground above them, and retain even now the marshy char-

acter derived from this circumstance. We know some of these drainage grounds which have been employed as building lots, which it has been found impossible by any contrivance to render dry; while other spots, situated at small distances from them, and having actually a less elevation above the sea, have been easily drained and kept dry. This, however, is not the only circumstance to which the difference in question is to be attributed; for in many of the elevations noted as being unhealthy, the earth was dry—and in others, although the ground was moist, that in the valley was yet more so. There is no doubt that the sides of hills and rising grounds serve as points of attraction to fogs and vapors, and that to this circumstance their unhealthiness is often to be attributed. The few observations which have yet been made on this interesting subject cannot be considered as possessing any great importance, or pointing at any distinct conclusion; but should farther observation go to confirm these facts, they may hereafter form the foundation of some useful theory.—*Boston Medical Journal*.

MORTUARY HOUSES.

In several cities and towns in Germany and Prussia there are institutions, or offices of inspection, where persons, thought to be dead, are deposited for a week, to ascertain the decomposition of the body, and consequently the impossibility of a revival. The Mortuary House, however, is no uncomfortable residence. Warmed by stoves, the apartment is always kept in a moderate state of temperature; the windows, hung with curtains, diffuse a gloomy light; but the door, which is shining with wax, would grace the scene of a wedding ball. There are about twelve beds, placed in a row, as in a dormitory in a boarding school. Near the room, as at the Morgue in Paris, a person is constantly watching to see whether there be any signs of life among the bodies deposited there. He is surrounded with every thing necessary to assist in recalling animation. Precaution has been carried so far as to tie a bell string to the right foot of every corpse—by which means the guardian, even when in bed, is instantly apprised of the least movement of any one reviving. Houses of this kind have existed for the last forty years in the states of the Germanic Confederation.

SANDWICH RAILWAY.

THE enterprising Glass Company of Sandwich, under the superintendence of Mr. Jarvis, a gentleman well worthy the trust reposed in him, have just completed a Railway about half a mile in length, extending from the Factory at Jarvisville, to a wharf across a marsh, hitherto impassable by carriages. This railway is constructed upon billets of wood, which are driven into the earth at short distances, forming a very firm foundation; upon this the rails of wood are laid, the grooves being of iron. There are now but two cars attached to the railway, one for the transportation of passengers, and the other for baggage, goods, &c. These are propelled by horse power, at the rate of twelve miles an hour, but capable of moving at a much greater rapidity. Trial was made of the cars upon the railway on Saturday last for the first time, which we had the pleasure of witnessing. Every thing succeeded beyond the most sanguine expectations of the proprietors, and the railway promises to be a great auxiliary both in saving of

time and labor to the industrious citizens of Jarvisville, a name given to the factory village in honor of Mr. Jarvis, the agent above mentioned.—*Barnstable Patriot*.

DISCOVERY OF INDIAN CORN.

PREVIOUSLY to the settlement of the Puritans in New England, they formed parties for the purpose of exploring the country. Captain Miles Standish, who may be called the "hero of New England," commanded one of them, consisting of sixteen men. In their progress they met with several small hillocks, supposed by them to be burial places for the Indians; but, as they advanced, finding many more, they closely examined them, and discovered that they contained *Indian corn*.—Being buried in the ear, it excited their curiosity, and by some of the party was thought a valuable acquisition; while others who ate it in a raw state, did not relish it, and thought it worth little or nothing. They secured, however, some for seed the ensuing spring. Squanto, a friendly Indian, instructed them in the culture of it; and it was, probably, the means of saving them afterwards from famine.

From the Buffalo Bulletin.

U. S. MINT.

FROM an article credited to the N. Y. American, it appears that the total amount coined at this establishment since the year 1793, is \$37,000,000. It was founded in 1787. The land which it occupies, together with the buildings and machinery employed, have cost about \$190,000. The coinage in 1830, amounted to \$3,155,620. Of this sum, \$62,175 were in half Eagles, \$11,350 in quarter Eagles, \$2,382,400 in silver half Dollars, \$51,000 in Dimes, \$62,000 in half Dimes, and \$17,115 in cents.

In 1831 the coinage was larger—in each kind amounting in all to \$3,923,473 60, among which there was \$99,500 of quarter dollars coined in silver. In 1832 the amount coined was less than in 1831, being less than three millions and a half.

Of the amount of gold coined during these three years, about eighty thousand dollars were derived from Mexico, other parts of South America and the West Indies; twenty-eight thousand dollars from Africa; six hundred and seventy-eight thousand dollars from the gold regions of the U. S.; and twelve thousand dollars from sources unknown.

"It is estimated that the quantity of gold delivered at the Mint within the last year, from the gold region of the United States does not exceed half of what is produced from the mines—nearly an equal amount is supposed to have been exported uncoined, or consumed in various works of art. It would seem, therefore, that the production of gold in the United States within the past year, has been not less than a million and a quarter of dollars, or about one 6th of all the gold produced from the mines of both Europe and America within the same period.

"The Mint is supported from the funds of the public Treasury, for the general welfare and the honor of the national character. Depositors of gold or silver bullion receive without expense, an equal weight of gold or silver coins, for that which they deposit. The coinage of both these metals have been, invariably, free of charge."

From the Bunkerhill Aurora.

RAISING OF GRAPES.

THE season for Grapes has been generally very favorable, although in some gardens they have almost entirely failed. In the Vineyard of Mr. Kendall Bailey, is exhibited the finest display of foreign grapes, growing in the open air, which we have ever seen. The trellises are completely loaded with thick clustering bunches of large and full-grown fruit.

In Mr. Mead's Vineyard, under charge of Mr. Mason, the green-house vines exhibited a splendid show of fruit; but in the open air, the amount of fruit was small and scarcely deserving of attention.

In Mr. Davidson's Vineyard, we understand the vines have borne abundance of fine fruit.

The vines in Mr. James Hunnewell's garden, (rear of Rev. Mr. Walker's Church,) bore a fine show of fruit, at the gathering of which on Monday last, he invited his friends to partake of his abundance. The fruit was delicious and "fair to look upon." In his garden a Black Hamburg vine, in the open air, produced some beautiful fruit.

Mr. Joseph Hunnewell's vines, both foreign and native, have borne abundantly—they are exceedingly well protected from the cold winds of the climate.

The *Isabella* vines have been generally loaded with fruit this season. Col. Kendall has a vine, the second year of bearing, which produced this year by estimation about a thousand bunches of grapes. Mr. James Hunnewell's *Isabella* vines, and those of several other gentlemen in this town, bore almost enormous quantities of fruit—and this vine, for out-door cultivation, is yearly gaining a decided preference over the foreign varieties.

We are rejoiced that this admirable fruit has become so abundant among us. It is a delicious and wholesome fruit, and we hope in a few years to have it still more abundant and its use more general. All that is now raised finds a ready sale, and at comparatively high prices. A single vine of the *Isabella* grape will produce fruit sufficient for the use of a family.

THE TEETH.

A PERSON cannot be too careful of his teeth, for much of his comfort depends upon attention to their cleanliness. Care ought to be taken that no grit be in any composition that he may use. Charcoal however useful ought to be used with caution, for even the finest contains sharp edges, which by friction will wear away the outer coat and produce speedy decay. Filing is very injurious; remove the outward shell, and acids will, with ease, be enabled to act upon and corrode the teeth. Avoid purchasing all compositions for beautifying and whitening the teeth; they are in general composed of deleterious substances. I knew a lady who made use of magnesia; her teeth were excessively white; but before she arrived at thirty, her front teeth had decayed. Another used lime, and was not more successful. Water, with a few drops of the tincture of myrrh, will be found adequate. The too frequent use of acids is the principal cause of the loss of teeth. Myrrh will cause the gums to adhere closely to the tooth, and will therefore act as a preservative. There is great connexion between the stomach and the teeth; if care is not taken that the digestive organs be kept in order, the nerve of the tooth may be easily irritated and

cause great pain.—Salt dissolved in vinegar, and held in the mouth, will relieve the severest pain if the stomach be not the cause. A morbid stomach will generate both tooth and ear ache.—*People's Mag.*

POTATO PUDDING.

In the hands of an economical housekeeper, no vegetable can afford a greater variety of cheap and wholesome preparation than the potato. The following is Dr. Kitchener's direction for a cottage potato pudding.

Peel, boil and mash, a couple of pounds of potatoes, beat them up into a smooth batter, with about three quarters of a pint of milk, 2 ounces of moist sugar, and 2 or 3 beaten eggs.

Bake it about three quarters of an hour.

Three ounces of currants or raisins may be added.

Leave out the milk and add three ounces butter; it will make a very rich cake.

THE RESULT OF SOME EXPERIMENTS ON THE GROWTH OF POTATOES.

By JOHN LINDLEY, Esq. F. R. S.

"In order to acquire the greatest possible weight of potatoes per acre, it is necessary that large round heavy tubers should be employed, and that the space allowed for the growth of each plant should be as nearly as possible such as it would naturally occupy, if suffered to spread freely on all sides without interruption; that this space will vary according to the habits of particular varieties, and can only be determined by accurate experiments; that too much and too little room are alike injurious to productiveness; and that, finally, it is quite practicable at least to double the crops that are usually obtained."

"It cannot be necessary for me," says Mr. Lindley, "after this statement, to make any remarks upon the methods at present in use, of planting sets or fragments, or the smallest tubers, or even, as sometimes in Ireland, parings of the potato; the evil consequences of such practices cannot but be apparent to every one."

By MR. BARNET, OF EDINBURGH.

"We have been trying the planting of whole potatoes in wide rows; and, in a trial of three kinds, the mode has proved superior in one kind, the early frame, in rows 3 ft. apart, as this kind has yielded ten bolls [a boll is about six bushels] an acre more than when cultivated in the usual mode; namely, by small sets, and in rows 2 feet asunder. In the two other kinds, which were late ones, the produce of the new method has been inferior; but one kind had suffered considerably from the depredations of a herd of rats, so that the result in this case has not been satisfactorily ascertained."

MASS. HORTICULTURAL SOCIETY.

PROCEEDINGS

Of the Massachusetts Horticultural Society, Saturday, Oct. 12, 1833.

Frederick Wolcott, Esq. of Litchfield, Conn., Commodore Jesse D. Elliott, U. S. Navy, D. Smith M. Cauley, Esq. Consul General of the U. States, at Tripoli, were admitted as Honorary Members. N. Morton Davis, Esq. of Plymouth, was admitted a Subscription Member. Messrs. E. Vose, B. V. French, and Cheever Newhall, committee of Fi-

nance, and Zebedee Cook, jr., S. A. Shurtleff, and E. Vose, a Committee to procure a room for the future meetings of the Society.

EXHIBITION OF FRUITS.

Apples. From Mr. Hunnewell, Fall or Holland pippin of Cox, No. 15, very fine. Mr. Holyoke, Marlborough, Lyscom apple, sometimes called Mathews' stripe, a good autumn apple. Dr. Fiske, Lyscom, and a seedling apple of a red color and good flavor. E. Vose, Esq. Spice apple, English russet and Spitzenburg. Mr. Pratt, very large and handsome red apples, unknown. E. H. Derby, Esq. Salem, 2 sorts of apples, true names unknown, one of them cultivated at Salem as "Osgood's Favorite." Charles Brown, Newton, Lady apple, Cox No. 28. B. V. French, Esq. Yellow Bellflower, Cox, No. 33. Major G. Dickenson, Deerfield, Bard apples. Col. John Wilson, Deerfield, Dickinson apples. R. Manning, Hollandsbury, (Ronald, plate 40, fig. 2;) Wine sap, Cox No. 89; Bellflower, Cox No. 33; Stump apple, supposed to be a native of Essex county.

Pears. From S. Downer, Esq. Wilkinson, very superior; Napoleon, Diel, unripe; Moorfowl's Egg, Crassane, and Florelle, Pomological Mag. No. 112. N. M. Davis, Esq. of Plymouth, Duchess of Angouleme, Pom. Mag. No. 76, weighs 12 ounces. James Reed, Esq. Roxbury, Moorfowl's egg. Capt. Wm. Lander, Salem, pears, name unknown. S. G. Perkins, Esq. Doyenne Gris, Forsyth No. 44, Napoleon, Pom. Mag. No. 75. B. V. French, Esq. pears, name unknown. E. Vose, Esq. Wilkinson, Marie Louise, and Capiaumont, Pom. Mag. No. 59, all beautiful and good. T. Loring, Esq. Hingham, Treasure, a large baking pear. John Mackay, Esq. large pear, supposed the Treasure. R. Manning, Passe Colmar, Pom. Mag. No. 64, Easter Beurre, or Bergamot Penticote, Pom. Mag. No. 78, Orange Bergamot, Cox No. 53, Winter Orange, Cox No. 37, Louise Bonne of Duhamel, and Buffum, a native of Rhode Island.

Peaches. From Wm. Kenrick, Williamson's N. Y. Clingstone, Eagle's late Rarieripe, and Spanish Clingstone, very fine. S. Downer, Esq. and J. Balch, Esq. Seedling Clingstone Peaches.

Grapes. Joshua Child, Boston, Grisley Tokay and Black Hamburg. Samuel Hastings, Boston, Black Cluster. Benj. Guild, Esq. Sweetwater and Lombardy. Samuel Pond, Isabella, Catawba; and Pond's Seedling, a very fine native grape, free from the fox flavor. Mr. Sullivan's garden, Black Hamburg. S. Downer, Esq. Schuylkill Muscadelle, Buck, Winne, Troy, Prince Edward, and Black Cluster, all identical, and not worthy of cultivation. Wm. Kenrick, Alexander, Catawba, Black Austrian and Bland's. J. Balch, Esq. Roxbury, "Pied Rouse," of rich flavor and worthy of cultivation.

It may not be improper to observe, that where reference is made to the descriptions or figures of any pomological author, it is intended to say that they are the identical fruits described and figured by such authors. For the Committee,

ROBERT MANNING.

EXTINGUISHING FIRES BY STEAM.

In a house 15 ft. by 15 ft. and 10 high, combustible materials were put in the four corners and centre, and set on fire, and allowed to burn till the flames reached a height of about 9 or 10 feet; steam was then admitted, which extinguished the flames in less than two minutes.—*Scottish Guardian.*

*From the Providence Journal.***PAWTUXET FAIR.**

We publish to day the official reports of the several Committees at the Pawtuxet Fair, holden on Wednesday last. The day was unusually fine, and the concourse of spectators was larger than we have ever witnessed on a similar occasion. The quantity of live stock, and many articles of every description, was much smaller than has usually been exhibited at the annual Fair. The butter and cheese were very excellent; the former selling at auction—1st premium for 55 cents; 2d do. for 40 cents, and the 3d do. for 30 cents per pound. The spirit of the auction was kept up with great zest by the facetious and animating manner of Mr. Stoddard, the auctioneer, and many articles of manufacture were sold for liberal prices.

Among the curious specimens of handiwork exhibited, was a knife, manufactured by Mr. P. Fox, of this city, which would be a very good substitute for a sett of carpenters' tools, with the exception, perhaps, of a broad axe and cross cut saw. We also saw a patent straw cutter, the invention of Mr. B. R. Greene, of Warwick, which, we should think, would be valuable for the purpose for which it was designed. The Messrs. Orrell, and Mr. Ferron, of this city, offered several brass, steel, and cane reeds, of superior quality, for which premiums were awarded.

The Society met in the morning for the election of officers, a list of which we shall publish another day. Great credit is due to the President, the Hon. James Rhodes, and the officers, in raising the Society to its present prosperous condition. During the present year, a Manual Labor School has been established, under the patronage of the Society, which now numbers on its catalogue ninety-two scholars, from several States. It is located upon an eminence, commanding an extensive and most delightful view of the surrounding country, and of Narragansett Bay. For a more particular account of the operations of the School, and the general business of the day, we refer the reader to the official reports.

OFFICIAL REPORT,

Of the Annual Cattle Show and Fair, under the patronage of the Rhode Island Society for the Encouragement of Domestic Industry, holden at Pawtuxet, Sept. 25, 1833.

NEAT STOCK.

The Committee on Neat Stock, except Working Cattle, report, that they have awarded to Abner Sprague, jr. of Cranston, for the best

Bull, to be kept in the State one year, \$10
Samuel Gorton of Warwick, for the next best do. 3

Thomas B. Bowen of Warwick, for the best Bull Calf, 5

Christopher Smith of Barrington, for the next best do. 3

The above two, were the only Bull Calves exhibited for a premium. There were no Cows exhibited for the first premium, as no person offered three. They have awarded to

John B. Mattison of East Greenwich, for the best Cow, 5

And they recommend that a premium of three dollars each be given to Samuel W. Greene of North Providence, and to Christopher Sheldon of Cranston, for the next best Cows.

Nathaniel Bump of Providence, for the best two year old Heifer, having had a calf, Samuel W. Greene of North Providence, for the next best do. 6

John S. Aborn of Cranston, for the best Yearling Heifer, 4

Thomas Greene of Warwick, for the next best do. 4

All of which is respectfully submitted by
JOHN PITMAN,

For the Committee.

WORKING CATTLE.

The Committee on Working Cattle beg leave to report, that the number is not so large as has been heretofore offered, but a very fine selection; and after mature consideration, they award the following premiums—to

Abraham Lockwood of Warwick, for the best pair, \$6

Olney Williams of Scituate, for the next best do. 4

Joseph Budlong of Cranston, for the next best do. 2

For the Committee,

STERRY JENCKES.

HOUSEHOLD MANUFACTURES.

The Committee on Household Manufactures, having proceeded to, and performed the duties of their appointment, beg leave, respectfully, to report, that they award the following premiums offered in the Show Bill, viz:—to

Joseph Read of Coventry, for the best piece of Carpeting, \$6

Barbara Greene of Warwick, for the next best do. do. 4

Eliza A. Fenner of Scituate, for a piece of Carpeting, one dollar and fifty cents. 1 50

Polly Stafford of Warwick, for Woollen Hose, 2

Elizabeth W. Gardner of Warwick, for a piece of Carpeting, one dollar fifty cents, 1 50

For Flax and Hemp Hose there was no competition.

Elizabeth W. Gardner of Warwick, for the best Cotton Hose, 2

Polly Stafford of Warwick, for the best Worsted Hose, 2

Elizabeth W. Gardner of Warwick, for the best piece of Wool Flannel, 5

And recommend the following premiums, on articles not included in the Bill, viz:—

Mary E. Holden of Warwick, for a splendid Hearth Rug, and a pair of Crickets, \$5

Almira Greene of Warwick, for a piece of Woollen Blanketing, 2

Polly Stafford of Warwick, for two pieces of Linen Diaper, 2

Sarah A. Wirling of Providence, for two Hearth Rugs, 1

E. M. & A. Fenner of Scituate, for a Hearth Rug, 3

Mary A. Hough of Providence, for a Box of Feather Fans, &c. 1

Samuel W. Greene of North Providence, for a Cotton worked Counterpane, 1

Nancy H. Greene of Warwick, for Woollen half hose, 1

Catherine S. Gardiner of Warwick, a colored girl, aged 12 years, for a wrought Samplar, 1

Anne E. Page of Gloucester, for a piece of Damask diaper, 1

Abby Eddy of Providence, for a Fancy Cape made of milk weed, 1

Rosanna Greene of Warwick, for Woollen half hose, seventy-five cents. 75

Abby Bullock of Providence, for a Fancy Cape made of milk weed, fifty cents. 50

Martha Hodges of Providence, for a Lamp Rug, fifty cents. 50

The Committee regret the fact, that the competition in Household manufactures, this year, is not so spirited as on former occasions. Many of the specimens produced, were, however, excellent as to material and workmanship.

For the Committee,

WM. E. RICHMOND.

RAW SILK, &c.

The Committee on Raw Silk and Mulberry Trees report, that they have awarded to Lemuel Burge of Wickford, for the best lot of Raw Silk, say 15½ lbs. \$5

Samuel W. Greene of North Providence, for the next best do. 2

Samuel W. Greene of North Providence, for a lot of Sewing Silk, 3

Lemuel Burge of Wickford, for a lot of Sewing Silk, 2

Lemuel Burge of Wickford, for the largest quantity of Mulberry Trees, say from 8000 to 10,000, a certificate to that effect being produced, 5

Henry J. Congdon of Wickford, for a lot of Mulberry Trees, say 5000, a certificate to that effect being produced, 4

SOLOMON DROWN,

For the Committee.

SHOP MANUFACTURES.

The Committee on Shop Manufactures report the following premiums:—

Nicholas Smith of Johnston, for a pair of wheels, tongue and axletree, \$5

John Fenner of Cranston, for a lot of rakes, 3

Robert Orrell of Providence, for Brass, Steel, and Cane Reeds, 3

Waldo Stone of Providence, for a lot of Gear-ing, 3

Patrick Fox of Providence, for a Sportsman's Knife, 2

A. Anthony & Co. of Providence, for a lot of Calf Skins, 2

Geo. Crandall of Pawtuxet, for a Mahogany dressing case, 1

A. Anthony & Co. of Providence, for a lot of Sheep Skins, 1

Albert A. Partridge of Pawtuxet, one of the Scholars, for a Writing desk, 1

Walter W. Orrell of Providence, for a Brass Reed, 1

Ambrose Ferron of Providence, for a Steel Reed, 1

J. F. Page of Providence, for a very small gold Padlock, 1

SAMUEL PEARSON,

For the Committee.

BUTTER AND CHEESE.

The Committee appointed on Butter and Cheese, having attended to the duties of their appointment, do pronounce many of them excellent, being difficult to make a selection of the best, and they award the following premiums. To

Joseph Sheldon of Cranston, for the best lot of Cheese, \$8

| | |
|---|----|
| Catharine C. Warner of Warwick, for the next best do. | 6 |
| Benoni Waterman of Cranston, for the best lot of Butter, | 10 |
| Jesse Tourtellot of Glocester, for the next best do. do., | 9 |
| Clarissa Webster of Johnston, for the next best do. do., | 8 |
| Ruth Alverson of Johnston, for the next best do. do., | 7 |
| Thomas B. Bowen of Warwick, for the next best do. do., | 6 |

WILLIAM ANTHONY,
For the Committee.

AGRICULTURAL EXPERIMENTS.

The Committee on Agricultural experiments, Vegetable Crops, Grain, &c., report—That having examined the several lots cultivated by the Students, they have been gratified with their appearance. The crops are better than they expected, and great credit is due to the Teachers, as well as to the Students, for their skill and assiduity in the case. To the following Students they recommend that the following premiums be awarded, viz:—To Henry R. Greene, Jr., four dollars and the Farmer's Guide; Albert Daily, three dollars and the Farmer's Guide; Charles B. Cross, two dollars and the Farmer's Guide; John D. Potter, one dollar and fifty cents, and the Farmer's Guide; Geo. W. Chapin, one dollar and fifty cents, and the Farmer's Guide; Joseph S. Pitman, one dollar and fifty cents, and the Farmer's Guide; Henry T. Beckwith, one dollar and fifty cents and the Farmer's Guide; Benjamin B. Adams, one dollar and fifty cents and the Farmer's Guide; Stillman Rich, one dollar and the Farmer's Guide; Thomas W. Harrison, the Farmer's Guide; Henry Gorham, the Farmer's Guide; George L. Nottage, the Farmer's Guide; and John S. Palmer, the Farmer's Guide.

The basket of red and white Potatoes is an interesting specimen, but the vouchers necessary for a premium were not exhibited. The large Sugar Beets, presented by Governor Francis, and the two presented by Mr. Aldrich, as well as the large, very fine Apples, presented by Capt. Jenckes, merit special notice. The Potatoes raised from one sent from Paris to Mr. Fessenden, and by him presented, are a curiosity, and the Committee recommend a general distribution of them.

A. MESSER, for the Committee.

Fifty-seven dollars and seventy-five cents were awarded to the scholars of the School, for mechanical labor. Among those who proved to possess the most skill and industry in the department, we notice the names of Griggs, Armington, Esten, Dexter, Allen, Ballou, Pike, Brown, Taylor, and Smith.

The Crops raised on the Society's lands, and which belong exclusively to the AGRICULTURAL SCHOLARS, are valued at one hundred and twenty dollars, which, taking into consideration the lateness of the season when the School and the farming operations commenced, (the latter being about the 25th of May) the produce on less than four acres of land will be considered large.

SHEEP AND SWINE.

The Committee on Sheep and Swine report, that the Stock of Sheep was quite limited, and, after examining, have awarded the following premiums, viz:

| | |
|--|-----|
| Joseph S. Budlong of Cranston, for the best Boar, | \$6 |
| William Ballou of Smithfield, for the next best do., | 4 |
| Arthur Greene of Cranston, for the next best do., | 2 |
| Joseph S. Budlong of Cranston, for the best lot of Pigs, | 4 |
| Arthur Greene of Cranston, for the next best do. | 2 |
| Amos Jenckes of Foster, for the best Saxony Buck, | 4 |
| Joseph Wells of Foster, for the next best do., | 2 |

THOMAS HOLDEN,
For the Committee.

HORSES.

The Committee on Horses, having attended to the duties assigned them, beg leave to report, that there was no horse, presented for a premium in time.

On Mares and Colts, they award the first premium of eight dollars, to Edward Manton of Johnston.

The second premium of six dollars, to Wickes Gardiner of Warwick.

Both of the above colts were sired by Young Eclipse, owned by Edmund Brownell, Esq. of Little Compton.

CHARLES ELDRIDGE, for the Committee.

PLOUGHING.

The Committee on Ploughing, report that they consider the work well done, and with the usual expedition, considering the ground, and owing to the short bouts. The quickest time is 25 minutes, and the longest is 29 minutes. The quantity of land, one eighth of an acre. They award the premiums as follows, viz:—to

| | |
|------------------------------------|-----|
| Edward Perry of North Providence, | \$9 |
| Andrew Angell of Johnson, | 8 |
| Richard Brown of North Providence, | 7 |
| Jonathan Cooke of Foster, | 6 |
| Joseph S. Budlong of Cranston, | 5 |
| Olney Williams of Scituate, | 4 |
| Joseph Wells of Foster, | 3 |

JESSE TOURTELLOT,
For the Committee.

The Dividends will be paid out, at the store of C. & Wm. Rhodes, in Providence. All persons having bills or demands against the Rhode-Island Society for the Encouragement of Domestic Industry, or the Rhode-Island Classical Agricultural and Mechanical School, are requested to exhibit them to the subscriber.

JNO. H. ORMSBEE, JR.
Assistant Secretary.

PLYMOUTH CO. CATTLE SHOW, &c.

THE Agricultural Society of this County held its annual meeting at Bridgewater on Wednesday last. The Address by Rev. Mr. RICHARDSON of this town is spoken of as a highly interesting and able performance.

At the ploughing match, we are informed, the first premium was awarded to Charles Howard of this town, for his Plough. Charles Fearing, ploughman—Joseph Cushing, driver. Second premium to Charles Howard for his self-governing plough: Nehemiah Ripley, ploughman and driver.

First premium for the best Carpet, to Mrs. Eunice Ripley, wife of Dea. Neh. Ripley of this town.

To Miss Priscilla Burr, for the best Lace Cape a premium.

To Miss Mary Ann Whiton of this town, daughter of Capt. Moses Whiton, for a Ladies' Velvet Bag, beautifully embroidered with beads, a premium. To the same for a Lace Cape, a premium.

The exhibition of articles of manufacture and industry was handsome and highly creditable to the good old county of Plymouth. A beautiful machine for winding silk from the cocoons, and by the same movement completing the process of doubling and twisting the silk, was exhibited by Friend Brooks of Scituate. The machine is of his own invention, for which he has obtained a patent. It moves by a crank that a child may easily turn. His wife attended the cocoons as they were unwinding by dozens at the same moment, and evinced that in her hands the manufacture of this valuable article was a work of no difficulty.

In the stalls were a number of fat oxen that gave good credit to their keepers. In general the stock was not equal to that of preceding years. The severe drought of the season accounts for this.

The Agricultural Society of this county appears to be in a flourishing state, and is evidently giving important encouragement and impulse to various branches of useful industry.—*Hingham Gaz.*

ALBANY HORTICULTURAL SOCIETY.

THE Albany Horticultural Society celebrated its 4th Anniversary on the 14th ult. at the Mansion House kept by J. P. Bradstreet in Albany. Among the contributions exhibited were, from the Albany nursery of Messrs. Buel and Wilson, 250 varieties of splendid double Dahlias; a large basket full of different kinds of Flowers, &c. From Wm. Prince and Sons, Flushing, Long Island, Twenty varieties very splendid double Dahlias, labelled with their different names; one cluster, weighing 24 oz. Syrian white Grape, a new variety, and of exceeding fine flavor. Among the guests were the Governor and the Recorder of the city, and among the decorations a Pyramid of Dahlias, from six to eight feet in height, and upwards of three feet in circumference at the base, comprising 250 varieties of the double Dahlia and other flowers, and forming altogether a most splendid combination, very imposing and beautiful in appearance. It was designed and arranged by Judge Buel, exclusively of the flowers from the Albany Nursery. Jesse Buel, Esq. President of the Society, presided; assisted by Isaac Denniston, Esq. Vice President, and by D. B. Slingerland, P. V. Shankland, and A. Gallup, Esqs. Committee of Arrangements.

Premiums were awarded to the following gentlemen: Largest and best variety of vegetables, Stephen Van Rensselaer, jr.

On the next largest and best variety, John K. Paige.

On the largest and best variety of fruit, D. B. Slingerland.

On the next largest and best do. Isaac Denniston.

On the largest and best variety of flowers, Buel & Wilson.

On the next best, Jeremiah Whalen.

Discretionary premium on cellery, Theophilus Russel.

Honorary premiums to T. W. Ford, Aaron Thorp, R. Westerlo, J. Smith, L. Cruttenber and Wm. Prince & Sons.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 16, 1833.

CATERPILLARS.

THOS. G. FESSENDEN, Esq.—Sir, Having had an opportunity for the first time the past season (having always resided in the city) to observe the movements and operations of the various insects that infest and injure the fruit trees—my curiosity and attention was called more particularly to the *Caterpillar*, having seen a great deal respecting them in your paper. Several apple trees are situated near my house, so that I had a fair chance to watch them. I found in dull, cool, wet mornings, they were generally all at home: I thought that a good time to try my experiment. On a tree in front of my window, on a lower limb, was a large nest, containing thousands of caterpillars: I thought I would try if I could prevent their intercourse with the other parts of the tree, thinking if I could it might lead to something more important: I am happy to say I did succeed, and *stopt* them. The experiment was as follows: viz. with India rubber dissolved in spirits of turpentine, about as thick as common paint, I made a circle round the limb on which the nest was, near the body of the tree, about half an inch wide, with a small brush, on which I sifted from a common pepper box *flour of sulphur*, pretty thick. I then disturbed them in the nest to see the effect. They came to the sulphur, and halted much quicker than many soldiers I have seen at the word of command—but did not march over the line, but retreated as quick as possible. I watched them for some time, and did not see one cross the sulphur. The nest is now on the limb with the remains of the starved caterpillars; the foliage is entirely dead. The other part of the tree is in good health, and bearing: one of the apples I herewith send you.

I am yours, respectfully, Wm. Howe.
Dorchester, Sept. 1833.

By the Editor. We are always right glad to receive notices of experiments of the kind mentioned above. But, as "one swallow makes no summer," one experiment cannot be deemed conclusive in matters relating to rural economy, &c. In the N. E. Farmer, vol. i, p. 379, we republished from the second vol. of the Memoirs of the Board of Agriculture, an article attributed to George Webster of Albany, in which it is asserted, in substance, that on boring a hole into a tree infested with caterpillars, or other insects of any sort, filling the hole with sulphur, and driving a plug to confine the sulphur, the insects would perish or leave the tree in forty-eight hours. This experiment, however, was tried by Dr. Thacher, and "A Brookline Farmer," [see New England Farmer, vol. ii. p. 370, and 377] but without producing any perceptible effect. Dr. Thacher's experiments were as follows:

"Early in May, when caterpillars had attained to about one third their natural size, I selected a nest on the branch of an apple tree, and eight feet below the nest I bored a hole about two-thirds through the main branch, being about 5 inches, into which I crowded more than a spoonful of flour of sulphur, and plugged up the hole. In 48 hours after, I visited the object of my curiosity, and found that not a single reptile had received its quietus. I left them to the influence of the drug four days longer when finding the whole hive in their active gambols, increasing in size in defiance

of my experiment, I opened the nest and despatched the inhabitants. A few days after I observed that a new nest had been constructed on the same branch by a few of the tribe, which had escaped my vigilance. In about 16 days I bored out the plug and found the sulphur not diminished in quantity, but rather increased in its odour by confinement. As the result of this experiment did not diminish my incredulity, I selected another nest, which I opened and filled with sulphur; and having wrapped a covering of paper round the nest to confine the insects, I left them completely enveloped and exposed to the noxious drug for about twenty four hours, when finding them in the enjoyment of perfect health and vigor, I subjected them to the fumes of burning sulphur, to which they did not yield until scorched by the blaze. This closed my experiments and confirmed my scepticism."

It is probable that the spirits of turpentine might be more obnoxious to insects than sulphur, and with the India rubber to give it consistency might form a temporary barrier to the progress of caterpillars. But, perhaps it would be easier to take them by storm in their citadel than to draw a line of circumvallation round their head quarters. A very few drops of spirits of turpentine, or of common fish oil, or a mixture of both, or strong soap suds introduced into a nest by a rag fastened to a pole and wet with those substances; or the use of the well known brush of Col. Pickering, afford short and complete modes of destroying caterpillars. Some say, however, that a sprinkling with a decoction of tobacco, from a syringe or water pot, is the best application for the purpose above mentioned.

SPORT OF NATURE.

Mr. Nathaniel S. Bennett of Framingham, Mass. has sent us a small box, containing clusters of Isabella Grapes, in which some grapes are ripe and edible, others blasted, and some green, appearing to be about half grown. Mr. B. wishes me to tell if I can "why nature should be so *unnatural* as to destroy much of its first progeny that might have been worth something, and then send out so many of those late worthless berries as you see on those I send you, and that without any blossoms?"

We are not able to account for this departure from the common law of vegetation. Perhaps the first crop was blasted by east winds, frost or insects, and the second crop was the consequence of an effort of nature at reproduction, similar to that which causes the second growth of the young plants of Indian corn, after a frost, which has cut them down to the surface of the ground. With regard to the second growth not being preceded by blossoms, there is, perhaps, something analogous in the produce of certain insects, such as the Aphis for example, in which naturalists tell us that one impregnation will serve for several successive generations.

For the New England Farmer.

ASHES APPLIED TO PEAR TREES.

Respected Sir,—I have enclosed in a small package a sample of Pears, should you deem them worthy of acceptance; although the name and species is not known with us.

About three years since, I commenced digging around and removing the earth and tough sward from the body of the tree; filling up with fresh ashes, applying it in fall and winter, about a bush-

el and a half yearly, since which the fruit has assumed a new color, become much larger, as you can perceive by the one inclosed in white paper, which is about the average size of their former growth.

The quantity of fruit the tree now yields is more than double that of former years, all which can be satisfactorily attested. Yours, &c. most respectfully,
JOHN S. CHAMPNEY.

Abington, Oct. 10, 1833.

ITEMS OF INTELLIGENCE.

Cattle Show, &c. The Annual Exhibition and Cattle Show, of the Plymouth County Agricultural Society, took place at Bridgewater, on Wednesday last, and, although the morning showed strong symptoms of a very unfavorable day, yet, we thought, the collection of people was unusually great. The number and appearance of the stock in the pens was respectable, and we were told that this part of the exhibition was equal to that of any former year. In the hall of manufactures, were many articles of the nicest needlework, network, &c. We were told by the committee, that the manufactures were fewer in number, but equal in quality, to those of former years. At ten o'clock, a choice of officers took place, and generally those of the last year were re-elected. At one o'clock, the Society set down to a substantial Farmer's dinner, at Sampson's Hotel, after which they proceeded to the meeting house, where they listened to a very excellent, practical and appropriate address from the Rev. Joseph Richardson, of Hingham. *Plymouth Memorial.*

Temperance. The first association for abstinence from ardent spirits that we have heard of, was formed at Litchfield, Conn. on the 9th of May, 1789, and consisted of thirty-four members, eleven of whom are now living.

The next Temperance Society was established at Moreau and Northumberland, Saratoga county, N. Y. in 1808. Fines were provided of 25 cents, for drinking ardent spirits and wine, 25 for offering them to others, and 50 for being intoxicated. This Society consisted of forty-three members, nearly all of whom are living.—*Salem Observer.*

Black Hawk. Found, 26 feet below the surface of the earth, at Portsmouth, Virginia, while boring for water, a silver coin, the size of an English shilling. The effigies are prominent, and one of the profiles resembles Black Hawk, and probably represents one of his ancestors. The inscription is in Roman letters, but indistinct. On the reverse side is the figure of a warrior bare-headed, holding a spear, and in the attitude of coming to the charge. No one can tell the age of this coin, or the circumstances of its deep deposit.

The total number of sheep in Vermont, according to the returns in the Secretary of State's office were for the year 1831, 760,607, for 1832, 805,409. The increase is less than 6 per cent.—*Vermont Intelligencer.*

As every individual is interested in making his return as small as possible, the whole number of sheep in the state, is not probably less than one million.—*Brattleborough Inquirer.*

We have been presented with an apple taken from a tree in this village, weighing seventeen ounces and measuring fifteen inches in circumference. We understand that one was taken from the same tree which weighed nineteen ounces—a little heavier, we believe, than any of which our Massachusetts neighbors have boasted.—*Brattleborough Messenger.*

Enormous Fruit. We examined a few days since, a quantity of apples raised by Gov. Lincoln of the variety called the "Gloria Mundi," which for size and beauty

exceeded any thing of the kind we had ever seen before. Eighty-five of them, taken promiscuously as they were picked from the tree, measured a bushel and a half.—One of them, which was exceedingly fair and beautiful, measured thirteen inches in circumference, each way, and weighed twenty-one ounces.—*Worcester Spy.*

Great Apple. The largest specimen of this kind of fruit we ever beheld was exhibited in our office last week. Its exact weight was *twenty-one* ounces, and its circumference fourteen and a quarter inches. It was of the species called Royal, and raised from a tree planted by a gentleman in this town twenty-two years ago.—*Northampton Courier.*

NEW ENGLAND SEED STORE, AND HORTICULTURAL REPOSITORY.

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS, upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country: these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

N. E. Seed Store, connected with the N. E. Farmer Office, No. 51 & 52 North Market-st. GEORGE C. BARRETT.

WANTED.

HERDS GRASS, CLOVER, RED TOP. Of the growth of 1833 and of good quality.
ALSO—Flax and Hemp seed, for which cash will be paid. oct9

FRUIT AND FOREST TREES, &c.

BLOODGOOD & CO. have for Sale at their Nursery at *Flushing, L. I.* near New York, a large assortment of the most approved American and European sorts of Apple, Pear, Peach, Cherry, Plum, Apricot, Nectarine and Quince Trees, hardy Ornamental Trees, flowering Shrubs and Plants, of almost every description usually kept in Nurseries. Of the *Pear Trees* they have a large stock and of good growth, amongst which are most of the celebrated new sorts. About eight thousand of the *Morus Multicaulis Mulberry Trees*, so much esteemed for the feed of the Silkworm, which they will sell at Twenty-five Dollars per hundred. To Nurserymen who want to increase their stock or to sell again, liberal discount is made, excepting on the *Morus Multicaulis*. The *Fruit Trees* in this Establishment are all grafted or inoculated by the Proprietors, who feel confident in their being correct. Orders forwarded by mail to THOMAS BLOODGOOD, No. 203 Front Street, New York, or to BLOODGOOD & Co. Flushing, L. I. will be particularly attended to. Catalogues may be had of Geo. C. Barrett, at the Agricultural Warehouse, No. 52 North Market Street. 3t o 16

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *MORUS MULTICAULIS* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of **ROSES.** A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Alders, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Peonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

PEACOCKS.

TWO pair of beautiful Peacocks for sale, price \$10 per pair—these are beautiful Birds and unlike most of the domesticated fowls a benefit rather than injury to grounds and gardens, as they destroy insects without injuring vegetables or plants—enquire at the office of the New England Farmer. 2t oct16

VALUABLE FARM AT AUCTION OR PRIVATE SALE.

THE Subscriber offers for sale a Farm situated in the town of Marlboro', Mass. about half way between Howes' Tavern and the Lower Meeting-House. It consists of 140 acres of excellent land, with a large two-story Dwelling House, two Barns, Chaise and other Out-houses, with two fine Wells of Water. About 70 acres of the land is covered with a fine growth of the best quality of Wood; the remainder, consisting of Mowing Lands, Tillage and Orcharding, is in a high state of cultivation. It now supports 20 head of horned cattle, horses, swine, &c.

For the last 25 years, this estate has been improved by Mr. William Wilson, deceased, and for 50 years previous thereto, it was known as "Munroe's Tavern." The excellent quality of its soil, the large and valuable quantity of wood, and its other numerous advantages, make it a most desirable situation for a farmer; while its situation (on the old road to Worcester, on which the travel is great, the distance from any other tavern and its former notoriety as one,) makes it a no less desirable situation for a Tavern again.

The above estate, free from all incumbrances whatever, will be sold on Friday the first day of November, unless previously disposed of by private sale. As also, at the same time, all the cattle, a large quantity of hay and grain, farming utensils, &c. as are not previously disposed of.

Terms of purchase made known on the day of sale. Likewise, several other lots of land belonging to the same estate, will be sold at the same time.

JOSHUA WILSON, Administrator.

For further information, apply to WEBBER WILSON, on the premises, or to Messrs. LOT WHEELWRIGHT & SON, No. 46 Central Wharf. sep 11

BRIGHTON MARKET.—MONDAY, OCT. 14, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 3050 Beef Cattle, 340 Stores, 4700 Sheep, and 740 Swine.

PRICES. *Beef Cattle.*—The best qualities of Cattle did not sell quite so well as they did last week, but we shall quote about the same, viz: a few very fine at \$5 50; prime at \$5 a 5 25; good at \$4 50 a 4 75.

Barrelling Cattle.—We noticed the sales of several large lots but could not obtain the price; and it is extremely difficult for us to give a correct price for the number, but shall quote mess 4 25; No. 1, 3 75; No. 2, 3 25.

Stores.—Yearlings \$6 a 10; two year old 10 a 15; and very few sales.

Cows and Calves. Sales were noticed at 20, 23, 24 and \$28. *Sheep.*—Dull; several lots unsold. We noticed sales at \$1 33, 1 42, 1 53, 1 67, 1 71, 1 75, 1 83, 2 00, 2 12, 2 25, 2 33 and 2 50.

Swine.—Several lots of large selected Shoats were taken at 5, and lots of selected Sows at 4c. One lot of Sows and Barrows, a few of which were ordinary, at 4c. At retail 4½ for Sows, and 5½ for Barrows.

MISCELLANY.

THE WATERFALL.

I love the roaring waterfall,
Within some deep romantic glen;
Mid desert wilds, remote from all
The gay and busy haunts of men,
For its loud thunders sound to me
Like voices from eternity.

They tell of ages long gone by,
And beings that have passed away,
Who sought perhaps with curious eye,
These rocks where now I love to stray;
And thus its thunders sound to me
Like voices from eternity.

And, from the past, they seem to call
My spirit to the realms beyond
The ruin that must soon befall
These scenes where grandeur sits enthroned;
And thus its thunders sound to me
Like voices from eternity.

For I am on a torrent borne,
That whirls me rapidly away,
From morn to eve—from eve to morn—
From month to month—from day to day;
And all that live and breathe with me
Are hurrying to eternity.

This mighty cataract's thundering sound
In louder thunders soon must die;
And all these rugged mountains round,
Uprooted, must in ruin lie;
But that dread hour will prove to me
The dawning of eternity!

Eternity!—that vast unknown!
Who can that deep abyss explore?
Which swallows up the ages gone,
And rolls its billows evermore!
O, may I find that boundless sea,
A bright, a blest eternity!

ITEMS OF ECONOMY, ARTS, &c.

To Produce Onions of a Large Size. The Horticultural Register recommends the following method of obtaining large onions. When the beds are formed by the usual method, tramp them heavily, and roll them firmly. On this compact surface, sow the seed and cover it at the usual depth with a rich compost. The bulbs, instead of sinking will spread superficially to a good size, and ripen earlier.

Saltpetre as a Manure. The Journal of Agriculture recommends the use of nitre as a dressing for land, to be sown early in the spring, at the rate of one and a half cwt. to the acre. "It may be advantageously used on all soils, but particularly on gravelly or burning soils."

Horse Chestnut Tree. A writer for the Horticultural Register says that the fruit of the horse chestnut is useful for feeding pigs.

Agricultural Thrift. Gen. James Shelby of this county, sold a few days since, a flock of 160 mules, raised on his plantation, for the sum of \$11,840 cash in hand. Fourteen of these mules were purchased by the agent of a gentleman of Cuba, and were sold for \$130 each, making an aggregate of \$1,820 for the 14.—*Lexington, Ky. Int. of 24th ult.*

Cherry and Peach Stones. These should be preserved much more generally than they are. Were farmers in the habit of preserving them, fruit trees

would be far more common. By planting a few drills in the corner of the garden, the farmer would always be supplied with these trees to set about his house, in his orchard, and in unoccupied places of his fields. The best way is to have a box containing earth, in which the stones or pits should be put, and covered while they are fresh; for they often lose their vegetating property, if allowed to become very dry. In the spring they can be planted.—*N. Y. Farmer.*

A Beet and a Beater. We mentioned yesterday an enormous beet, weighing upwards of five pounds, a donation of which we were made the favored recipients. Today we have occasion to announce the reception of another mammoth specimen of the same vegetable esculent, from the garden of Mr. Seth Russell, weighing *seven pounds and six ounces.*—Our customers who expect to pay the amount of their annual subscription for this paper in country produce, are advised that we are fully supplied with *beets.*—*New Bedford Mercury.*

Cloth Buttons.—We are informed that 15,000 gross of Buttons are made every week within 10 or 12 miles of Northampton, for which the females who do the sewing, are paid between 1500 and 2000 dollars—in goods. Housework is going out of fashion, except where mothers have strength to do it. The farmers 10 or 20 miles from Northampton find as much difficulty in getting a girl to work in their families as the people of Northampton.—*Hampshire Gazette.*

Preservation of Leeches by feeding them with Sugar. The attention of the Academy of Medicine has been lately called to this subject by a chemist. A commission was appointed to investigate particulars, and they have given in their report, which, however, is not favorable to the proposal.

The chemist was of opinion, that the blood which we so frequently find in the water in which the leeches are kept is not disgorged, but flows from the wounds which the animals inflict on each other when huddled together; the commission doubt the accuracy of this. A great error has very generally been committed, in supposing that one of the causes of the loss of so many leeches, is the putrefaction of the "mucosities which exude from their bodies;" now these so called mucosities, are in fact the epidermes, which are regularly thrown off at intervals, in the same manner as the scarf-skin of a snake. The impressions of the rings of the leech are quite obvious on this mucosity; it is detached first towards the head, and the animal escapes from it as from a sheaf, which still adheres for a short time to the tail, so that we often see the leeches swimming about with this membranous appendage.—*Bull. Gen. and Med. Chirurg. Review.*

Hot Leg Baths.—The effect of hot water to the lower extremities on the general circulation, was strikingly exemplified in the case of an old gentleman subject to attacks of violent palpitation, with a feeling of approaching dissolution. I found him one day in one of those paroxysms. It had lasted many hours, and a fatal termination was expected, as the usual remedies had been tried in vain. By the use of a pediluvium as hot as he could bear it, the affection ceased in a few minutes, and he took some nourishment, slept, and arose quite recovered.—*Dr. Graves.*

A Prolific Swine. A neighbor of ours owns a porker, of common size, and seven years old, which has been the legitimate mother of about one hundred pigs. This in our neighborhood is considered a pretty remarkably old and fruitful specimen of the "whole hog."—*Barnstable Journal.*

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. COMMUNICATIONS.

For the New England Farmer.

NEW VARIETIES OF FRUITS.

MR. FESSENDEN, Of the numerous varieties of recently imported Fruits, of which the collection originated within 40 years in Europe appears to be very rich, both in quality and number, especially Pears, the result of the experimental cultivation of but few have been given to the public, as far as I am acquainted. Two or three articles from the Hon. J. Lowell, (to whom every friend of Horticulture is deeply indebted,) published in the N. E. Farmer, the principal of which is found in the 10th vol. page 41, contain nearly all that has come to my knowledge. Since then two years have elapsed, and as this has been a favorable season for fruits in general, may we not hope that much additional information may be communicated concerning the value of the various kinds of new fruits. There is such a diversity of soil, climate and temperature, between this country and Europe, that I am satisfied we cannot rely on the estimated value of fruits for cultivation in this country, as given in the European publications. It is extremely desirable to those who are selecting young fruit trees, which, especially pears, require many years to arrive at maturity of bearing, and may produce fruit for generations to come, to be possessed of all the information that can be had relative to their comparative value, in a corresponding climate. Believing that it will be gratifying to many others beside myself, I am emboldened through the medium of your paper, respectfully to request those gentlemen who are in possession of varieties of fruit, particularly pears, whose qualities in this climate are not generally known, to communicate to the public the results of their cultivation, so soon as their qualities are so discovered, and to give their opinion, founded on such cultivation, of their merits, compared with the old varieties, and of our native kinds, and compared with each other; and, as I deem this a matter of much moment, should such information not be communicated, for want of leisure or other causes, will not you, sir, give us the results of your inquiries and information on the subject from time to time.

I cannot lay down my pen without calling your attention, and that of horticulturists generally, to the necessity of some publication in this country, that shall embrace accurately delineated and colored figures of our American as well as the best new foreign varieties of fruits. Such a publication was suggested by Judge Buel in your paper, vol. viii. page 131, and the reasons for, and mode of conducting it, succinctly stated by him. Should it be thought there would be too little patronage for such a work, or that it would withdraw support from your paper, might not the "Farmer" be accommodated to this purpose by being changed to a monthly publication, and perhaps to an octavo form. Will you not consider the matter, previous to making arrangements for your next volume.

Respectfully yours, M. S.

Berlin, Ct. Oct. 9, 1833.

By the Editor. We should be apprehensive lest a paper of the kind, which would meet the wishes

of our correspondent, as expressed above, would not, in this country, at present meet with adequate encouragement. It is necessary in a Farmer's paper to devote most of its columns to the more common and indispensable objects of field culture, while those of the orchardist and horticulturist, though important, are to us of secondary consideration. The drawings and engravings for a Pomological Magazine, if well and accurately executed, would be very expensive.

For the New England Farmer.

BREAKING STEERS AND COLTS.

T. G. FESSENDEN, Esq.—Sir, I have seen several communications in your useful journal on the breaking of steers and colts, showing different ways by which they could be trained, with ease both to the manager and the animals. Almost every person likes his own management the best; and as my circumstances have been so limited, I have endeavored to adopt the cheapest and easiest mode of accustoming my young steers to the yoke, and my colts to the harness; and every humane person will pursue that course which will produce least bruised places and injured eyes, which are often to be seen on young creatures undergoing their training, and also of saving the trouble of making goad sticks and whip handles that are often needlessly broken about them. Now, Sir, I will lay before you my mode of treatment to these young animals, and if you think it worthy a place in your useful journal, you are at liberty to publish it; if not, you will not wound my feelings at all. I call my young cattle calves till they are one year old. I have a little yoke made with a staple and ring in it. I tell my little boys to yoke up their calves: a small boy can do it, and it is quite a pastime to them; they being so young are not so strong but that he can manage them with ease: any small stick or twig answers to drive them with, and there is no danger of the boy or steers being hurt. When he can drive them where he wishes them to go, which will soon be the case, he will hitch them to a small stick of wood, or if it is winter put them to a hand sled, and drive round with that; they will soon become docile. There is no trouble with them afterward, especially if they are yoked a few times the second winter; it makes them fond of their mates. Oxen that are trained when young are much more pliable and obedient, which adds much to their value: steers that run till they are three or four years old, are dangerous animals to encounter with; they are always running away with the cart or sled whenever there is a chance for them, and often serious injury is the result. I would not recommend working steers hard while young, as it would prevent their growth—there is a difference between working of them and barely training them.

Colts I begin with very soon after they are foaled; the mare should be bridled and led to the door and given a little salt. When the colt is one or two days old take him by the neck, handle him gently, he is then so young that he is not afraid, if his dam is near by him; continue this practice and he will very soon become fond of his owner, and will come on purpose to be handled after two or

three weeks. It does not hurt the mare or the colt to use her moderately. If you want to go to meeting on the Sabbath, harness the mare into the chaise or wagon, and tie the colt to the arm of the carriage; he may be a little obstinate at first, but in going a few rods he will be peaceable and go very orderly; if there are many other horses about, your colt is always with you: if you want to stop at a place any time, let your colt loose, he can be taken again without difficulty, and before you start off tie your colt again; in this way there is no trouble of the colt following other horses away. When they become old enough for service, you do not have to run over all the pasture for the horse; they can always be taken with ease. Colts, trained in this way are completely halter broken. When you begin to harness them they are not frightened by the noise of the carriage behind them, and are sooner made quiet in harness. It has been a common saying, that if colts are handled when very young it depresses their courage, which I am convinced is not the fact. I have raised as many horses as most farmers of my age in this vicinity, and some of them the most spirited I ever saw. The above rules I have practised for quite a number of years, and can recommend them to others with confidence. It convinces me of the truth and efficacy of a rule I have found in an old book I have, much worn by usage—although yet whole, it has been in our family almost a hundred years—which says, "train up a child in the way he should go, and when he is old he will not depart from it." Train up beasts while young—and I know when they are old they will be serviceable to their owners.

With due respect, yours, &c.

JAMES WALKER.

For the New England Farmer.

BRIGHTON CATTLE SHOW.

THE Committee on Ploughing Matches—consisting of John Prince of Roxbury, as Chairman, on both Committees; Eben. Heath of Brookline, and Daniel Chandler of Lexington, on double teams; Daniel Adams of West Newbury, and Nathan Adams of Medford, on single teams—beg leave to report: That 18 entries were made for the double teams, and 12 for the single, (a much greater number than ever before had offered;) on calling the roll on the ground, however, 13 double and 9 single only appeared. The Committee regretted that owing to the lots not having been previously marked out, they were delayed beyond the time appointed for commencing;—from the recent rains and the goodness of the soil, except a few rocks under the surface, they think better ploughing was never done at Brighton—all tried to excel—they were not limited in time, as goodness of work was to be the criterion in awarding the Society's liberal premiums. The lots contained one eighth of an acre each. After very close inspection of all the work performed, they were unanimous in awarding on the double teams, the

A narrow furrow slice was recommended, and $5\frac{1}{2}$ inches deep for the double teams, and 5 inches for the single teams, and to be laid flat. On these principles judgment was formed, and neatness of finishing off the work.

All the ploughs *except one*, were of the cast iron make; principally of Howard, Hitchcock or Prouty, Tice, Wright and Nurse. They were all good implements; but after careful examination of all of them, they could not feel justified in awarding the Ten Dollar premium offered, as they presumed it was not the intention of the Trustees to give it, unless for some *improvement*, or *better* plough than that to which the Society's premium of last year as they believe was so justly awarded to Mr. Howard of Hingham; the *wood* work of these ploughs is also considered superior.

It has frequently happened that *entries* have been made for ploughing, and the persons have not appeared on the ground; the Committee have thought it would have a good effect in future, to give the names of the defaulters to prevent a like occurrence again, as it often deters persons from entering, fearing they should not have a chance.

Per order of the Committee,

JOHN PRINCE, Chairman.

Brighton, 16th Oct. 1833.

MIDDLESEX CATTLE SHOW.

REPORT OF THE COMMITTEE ON SWINE.

Your Committee are of opinion that the profits of a farm essentially depend on the proper management of swine. They fear, however, that in very many instances the farmer would do nearly as well without them. In some, not to say many, instances, they remain nearly stationary for months for want of proper attention. There is a considerable time in the summer season, when, to the produce of the dairy, may be added, for their use, a great variety of green and tender weeds, of which the swine are very fond, and on which they will grow and fatten. These are generally to be procured in great quantities; and, in most cases, as easily by the poor as the rich. The hog will select, with instinctive certainty, those which are most nutritive; and the remainder being mixed with the manure while green and full of juices, add much to its quantity, without much diminishing the strength. When the site of the barn will admit of it, the hog pen should be a barn cellar, with a yard at the entrance where the animals may come to the sun. They will derive considerable nutriment from the manure which is made in the barn. That which is produced by horses, in-

stead of being left by itself to ferment and consume to ashes, will be mixed by them with other kinds, and thus be preserved, without any waste, or labor. The mass is continually worked over, and is never exposed to evaporation by the rays of the sun. The art of increasing the quantity, and improving the quality of manure, should be the farmer's first and last study; and it is believed that for these purposes the hog is not made so useful as he might easily be made to be.

The difficulty of transporting animals whose delicate constitutions do not admit of travelling on foot, and the unusual dampness of yesterday and to-day, which rendered exposure particularly hazardous, may account for the small number of hogs, who have given countenance to this anniversary.

Your Committee have the satisfaction to state that they have received a letter from the distinguished character, to whom the Society are indebted for many useful suggestions which were communicated in the last annual report of the Committee on swine; and they have thought proper to annex it to this report, that it may be preserved on your files.

To the Hog Committee of the Agricultural Society in the County of Middlesex.

Gentlemen—In a letter addressed to your immediate predecessors in office, I had the honor to express, at some length, my views of the comparative merits of your species, and my own. In that communication, a deep sense of the indignities, which have so long been heaped upon us, enabled me to be somewhat plain in my language. That you "richly deserved" all that was then said, your "good sense" must have already informed you. But the delicacy so natural to my race restrained me from expressing at that time all that I desired. The flattering manner in which my epistle was disposed of, and the perfect good feeling with which it was received by your Society, make me bold to renew the subject, and to add such further hints as may occur to me. And since my first ancestor was *turning up the soil*, before yours saw the light, I may be excused, if I should find time before closing in adding some intimations on the subject of agriculture.

But I must in the first place express my astonishment that you could ever have taken into your heads to imagine yourselves our superiors. We are what we were made to be, genuine *bona fide* hogs, and nothing else. We remain as in the beginning, having never fallen from our first estate. Will you say as much for yourselves? you not only admit, but insist upon, and contend for, all sorts of depravity, from very great to total; some of you maintaining that it is your very nature always to do wrong, and others that it is only a way you have got! Have the most expert slanderers among you ever accused *us* of any thing so bad? Compare your own acknowledged crimes with all you have ever charged upon us, and say whether the tenants of your State prisons ought not to outnumber the inmates of your hogpens. I will not wound your feelings by a recital of even your most common transgressions. I choose rather to repel the charges you bring against us.

And first, you have the assurance to charge us with *obstinacy*. And where is the semblance of proof to support the charge? We sometimes differ from you in opinion, it is true. But which is the obstinate party is the question. The truth is, you always have your own way right or wrong; and

because *we cannot help giving* you an occasional look of *mingled grief and disapprobation*, you presume to call us *obstinate*!

Then again you seriously charge us with a *want of cleanliness*. I will have the candor to admit that we are not at all times equally attentive to our external appearance; but is it not most frequently owing to your neglect to furnish us with proper apartments? Let your wives and daughters cook and eat, and wash, and make soap, and sleep in one small room, without either floor or ceiling, and then say which of us would be called the most lovely? A hog needs a parlor as much as any body else; give him one, and you will find him *there* at all proper hours, as fit and as prepared to see company as the best of you.

We are next charged with being *gluttons*. And here again I will be frank and candid. We do indeed hold it a sound maxim, that a hog should eat all he can get—and we have generally found this a safe rule, which seldom occasions us any inconvenience; though, *for manners sake*, we sometimes leave a part of our allowance. But, with the exception of this last circumstance, do you not do exactly the same thing? and like us, would you not gladly eat more if you could get it?

One word as to *drinking*. Since the hint given in my former letter, you have been rather silent on that point. But how do we stand on that score? Just read the histories of men and hogs, and compare them. Do you find that *we* had ever any license law to enable us to get drunk for the public good? Do you read that *we* ever posted as drunkards, a list of hogs, otherwise respectable? Have you ever known a guardian appointed over one of our number, for excessive drinking, gaming, idleness, or debauchery? or *that* guardian removed from office for the cause of intemperance? but I forbear. I know you have at last begun to follow the example which we have so long set you. I am heartily glad of it; I trust the time is soon to come, when a drunken man will be as strange a spectacle, as a drunken hog; and when the sight of a swill pail will not necessarily be associated with the idea of a rum jug.

You will excuse my frankness, gentlemen; you appear to me to need plain talk; and, if I shall be instrumental in inending your morals or your manners, it will give me many hours of pleasant reflections.

In the mean time we shall be happy to supply you with any thing in our line. In travelling through your county, I have observed your orchards, and have thought you might be in need of some of our bristles. A *tar brush* applied to your trees in the winter and spring would soon rid you of the cankerworm; and *Pickering's conical brush* would exterminate the caterpillar. By the way, I cannot but commend your practice of setting your apple trees so that the fruit may fall into the road, as it is exceedingly pleasant and refreshing to us on our travels.

We have also a good supply of *lard*, which we can recommend to the lovers of pancakes and fried fish, and whatever else pertains to the frying pan.

Also, an assortment of *bladders* for those who are too heavy for their element, and who wish to rise above their natural level.

Also on hand, a few prime *sausages* of domestic manufacture, and warranted not to rip.

Also, the newly invented self-taught *plough*, constructed on the principle of the *hog's nose*, with double mould boards, in imitation of the *chape*.

We have also a few *literary works*, consisting principally of books for children by the *Learned Pig*, *Hogg's Tales* by the Ettrick Shepherd, and an assortment of the Classics in *Hog Latin*.

As these are all published, and have been carefully revised and enlarged by *myself* for the special use of the American public, they may be safely relied on.

I have it in contemplation to publish a new work, entitled "*my strictures on men and things*." With this view, I have kept a diary on my travels to collect the materials, from which I beg leave to give you a short extract as a sample.

"Arrived at Worcester, quarter past 5 P. M.—good deal fatigued—plenty good corn—ate hearty supper and went to bed—dreamt I was in the centre of population—suppose had heard somebody say so—waked up—heard somebody snoring—gave me the fidgets—turned over and grunted twice. Slept late in the morning—called on the Governor—not at home—boy said gone to Insane Hospital to see Council—suppose same that helped him to find 'centre of population'—wonder how they got in—'fraid they'll never get out—boy wanted to know my name—told him none of his business. Went to see the cabinet of the Antiquarian Society—man there wanted to cut my tail off—told him had'nt done with it—too modern—do better next year.

"Two minutes past 10 A. M. left Worcester, tail and all—determined to go the whole hog—obliged to take the turnpike—no other road to take, runs over all the hills—very pleasant and slightly—good deal of land both sides—dined at Westborough—plenty good corn—sorry *Wesson* was gone—always glad to see me—used to like him.

"Arrived at Framingham twenty-nine minutes past 6 P. M.—plenty good corn—four Meeting-houses—very good people—new Bank—all very rich—plenty roads—suppose to accommodate travellers—almost one apiece—guide-boards few and not particular—take any road you please—just eight miles to any where—called on the Chairman of the hog Committee—right glad to see me—treated me like a gentleman—suspect he is better than he looks for."

If from this sample you should deem my proposed publication worthy of patronage, you will greatly oblige me by circulating the enclosed prospectus of the work at your next Cattle Show.

With great respect for your society, and high personal consideration, I have the honor to be your most devoted fellow mortal. PORCUS.

Your Committee conclude, by expressing their hearty good wishes for the success of the work which their learned friend proposes to publish. But as they never subscribe for any thing themselves, they cannot consistently propose it to others.

All which is respectfully submitted.

JOSIAH ADAMS, *Chairman*.

ITEMS OF ECONOMY, ARTS, &c.

Speed of Travelling. The swiftest flight of a carrier pigeon does not exceed the rate of twenty-six miles an hour. It is calculated that the velocity of a high wind is at the rate of about thirty to thirty-five miles an hour. The steam carriages on the Manchester and Liverpool Railway have been known to travel about six and thirty miles an

hour; and it is stated in the evidence before a Committee of the House of Commons, that steam-carriages have run on common roads at a speed exceeding forty miles an hour.—*Dr. Lardner*.

IMMENSE CHIMNEY.

A most magnificent brick-built chimney has just been completed, at the Alkali Works, a little below this town. It is the highest chimney in England, being 263 feet from the base, exceeding in height that of Muspratt's famous chimney at Liverpool by 38 feet, and St. Nicholas's Steeple, in this town, by 69 feet. It is 27 feet diameter at the base, and 7 feet at the top, which is finished by a stone coping; it contains upwards of half a million of bricks, and is computed to weigh nearly two thousand tons.—*Newcastle Jour.*

DOMESTIC MANUFACTURE—SILK.

WE have before us, by the politeness of a friend, some skeins of sewing silk, grown and manufactured by JONATHAN YOUNG, Esq. of Acton, Maine. The silk is even and strong, and appears to be of a very good quality. We have not the particulars in relation to its manufacture, but should be glad to lay them before the public. We have no doubt that it may be made a profitable business—the growing of the raw silk is so already in Connecticut—and it is rather surprising that more is not known and done in relation to it among the enterprising citizens of Maine.—*The Age*.

BRIGHTON REPORT.

The Committee appointed to award premiums on Milch Cows, Heifers, Bulls, and Bull Calves, have attended to the duty assigned them, and report as follows:

The first premium, to Mr. John Leathe, of Woburn, for his Cow, 5 years old, \$25
The second premium, to Mr. Luther Chamberlain, of Westborough, for his Cow, 12 years old, 15
The third premium, to Mr. Jacob W. Watson, of Princeton, for his Cow, 7 years old, 10

Mr. Leathe produced to the Committee a well attested certificate that his Cow had given for the months of June and July last, not less, at any time, than twenty-four quarts of milk per day, and that fourteen pounds, thirteen ounces and a half of excellent Butter had been made from her milk in one week. She was sold for one hundred dollars.

Mr. Chamberlain also stated, in writing, that his Cow was remarkable for giving milk of very superior quality; that she gave from the 10th of June to 20th, from nineteen to twenty quarts of milk per day, and from her milk during the ten days were made seventeen pounds of Butter and thirty pounds of Cheese; that the quantity of milk was reduced considerably from the 10th to the 20th of September, owing to the dry weather, and particularly to the want of a regular supply of good water; that for six months past the Cow has actually produced him ninety-four dollars, twenty-two cents, including eight dollars, forty-two cents, for which sum the calf was sold, and fattened on little more than half the milk she gave.

Mr. Watson, also, furnished a certificate, to which he made oath that his Cow gave from the 10th to 20th June, from twenty to twenty-one quarts of milk per day, from which was made sev-

enteen pounds of Butter for the ten days; from the 10th to the 20th September, she gave from sixteen to seventeen quarts of milk per day, and thirteen pounds of Butter were made from the milk she gave during the ten days. The three Cows were native breed, and had only grass feed during the time stated in the certificates.

HEIFERS.

The first premium to Capt. Ichabod Nichols, for his Heifer, with a Calf by her side, \$15
Second premium to the Rev. Mr. Briggs, of Lexington, for his Heifer, 17 months old, 12
Third premium to Capt. Hector Coffin, of Newbury, for his Heifer, 3 years old, with a Calf by her side, 8

Capt. Nichols was present, who with his son gave such an account of his Heifer of native breed, that the Committee on examining her had no hesitation in awarding the first premium. Capt. Nichols' knowledge of Milk Stock is well known.

A certificate was produced signed by two respectable men in Lexington, that accorded so well with the appearance of the animal presented, that the Committee awarded to the Rev. Mr. Briggs the second premium for his Heifer of native breed.

Capt. H. Coffin furnished ample testimonials of his Heifer being of the best native breed for the dairy, but the Calf with her being young, no trial of quantity or quality of her milk had been made, although appearances were favorable.

BULLS.

First premium to Mr. Levi Hammond, of Princeton, for his native Bull, 3 years old, \$20
Second premium to Mr. Cassander Gilman, of Raynham, for his Bull, 18 months old, native crossed with the Durham Short Horn Stock, 10

BULL CALVES.

First premium to Mr. Jacob W. Watson, of Princeton, for Bull Calf, 6 months old, native and foreign stock, 10
Second premium to Rev. Bailey Loring of Andover, for his bull calf, 5 months old, from a native cow, and Durham short horn bull, well shaped, but the color being black, was objectionable, 5

Mr. John Clapp of South Reading, exhibited a cow and calf, that was approved, and some other animals were entered for exhibition but no person being present, to point out their particular merit the Committee were not able to report them, but they were very much gratified by the handsome exhibition made by the Hon. John Welles. Five pens were occupied by cattle sent by him for exhibition only. The Committee could not but notice his milch cows, heifers of different ages, and young bulls; all in whole or in part, of the most approved imported breed, Denton, Admiral and Holderness. A yoke of white oxen attracted attention; they were large, well matched, and in fine order. He sent also a bull, "young Wye Comet," from a bull of that name, imported by John Hare Powell, Esq. In point of pedigree, young Wye Comet must take high rank, and the exhibition by Mr. Welles is abundant evidence that he has paid great attention in improving the breed of cattle in this section of the country.

All which is respectfully submitted by

GORHAM PARSONS, } *Com-*
NATHAN ADAMS, } *mittees.*
GEORGE SMITH, }

Brighton, Oct. 17th, 1833.

HORTICULTURAL.

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

THE following notices of the proceedings of the Mass. Hort. Society, on the 12th inst. were received too late for insertion last week.

M. P. Wilder, Dorchester, Dahlias of sorts—*Hibiscus Palustris*, do. *Africanus*, do. *Militaris*, *Lobelia splendens*, do. *fulgens*, *Tradescantia purpurea*, do. *alba*, do. *rubra*, *Impatiens variegata*, do. *coccinea*, Mexican *ageratum*. Asters of sorts—*Gomphrena globosa*, *Browallia elata*, *Cacalia coccinea*, *Centaurea americana*, *Ipomea coccinea*, *Dianthus caryophyllus*, do. *chinensis*, *Senecio elegans*, *Anchusa incarnata*, *Oenothera grandiflora*, *Petunia alba*, *Phlox pyramidalis*, do. *tardeflora*, *Mirabilis longifolia*, do. *alba*, *Keranthemum lucidum*, *Alyssum maritima*, *Aconitum napellus*, *Althea sinensis*, *Malva rosea*, *Salvia splendens*, *Coreopsis lanceolata*, do. *tinctoria*, *Delphinium grandiflora*, do. *consolida alba*, *Lathyrus striata*, do. *purpurea*, *Rudbeckia fulgida*, do. *purpurea*, *Double pyrethrum*, *Scabiosa astro purpurea*. *Crysanthemum* of sorts—*Jasminum grandiflora*, *Gilea capitata*, *Reseda odorata*, *Convolvulus minor*, *Silene armeria*, do. *belladifolia*, do. *noctiflora*, *Double escholtzia*. *Papaver* of sorts—varieties of *marigolds*.

William Kenrick, 60 varieties of Double Dahlias, among which were the following:—White, Yellow, Buff, Orange, Scarlet-scarlet Turbans; Superb scarlet, Anemoneflore, Camelliaflore, *Coccinea*, Carmine, Early profuse, Elizabeth, Purple, De Raad, Diana, Canary bird, Countess Plater, Giroffe, Goliath, Herschels, Hurd's favorite, Corbeau, Lilac, Dwarf lilac, Dark lilac, Quilled lilac, Pink Lady Grantham, Wells' dwarf crimson, Miller's George, Rex ruborum, Maroon, Preticosa, Pale scarlet, Star of Brunswick, *Tenuifolia*, *Narcissus carmine*, *Pomponne bicolor* Theodore. Also, the following variegated kinds—William, yellow tinged with red; Queen of Naples, petals pale and lilac, and much like the beauty of Salem; Henrietta, orange color and red; Pink variegated with straw color; Asmodeo, very dark crimson striped with black.

Thomas Mason, Charlestown Vineyard, variety of Dahlias.

Charles M. Hovey, Cambridgeport, superior specimens of China Asters.

Messrs. Winship, Dahlias and Herbaceous Plants.

By order of the Committee,

JNO. WINSHIP, Chairman.

From the Massachusetts (Worcester) Spy.
CATTLE SHOW.

THE annual Exhibition of the Agricultural Society of this County, was held on Wednesday last, in this town, and afforded the most satisfactory evidence of the continued interest taken in these exhibitions by all portions of the community. In consequence of the heavy rains on the preceding day and evening, it was generally feared that the Show would fall far short of its usual extent, if not fail altogether; but a bright morning disclosed an array of fat cattle, and other candidates for the premiums of the Society and the admiration of the spectators, nearly as great as on former occasions. The pens in general were well filled, (as the Reports of the Committees will show,) and the rooms of the Town Hall contained the usual amount and variety of agricultural products and manufactured articles. The Address by Judge Strong, which occupied about one hour and a half in the delivery, was listened to with manifest satisfaction by a

large concourse of citizens from all parts of the County, and amply repaid the attention it received. After the Address, and the inspection of the Pens, the members of the Society, and others present on the occasion, sat down to an excellent dinner at the Central Hotel. At five in the evening, the Reports of the several Committees were read at the Baptist Meeting House, and afforded gratifying proofs of the progress made in agricultural improvements during the past year.

The present state of things compared with what existed at the period of the formation of the Society, was adverted to in a very happy manner by the President, (Gov. Lincoln,) showing, most conclusively, the vast benefit conferred by the influence of the Society on the character of the common products of agricultural labor.

REPORTS OF COMMITTEES.

Made at the Cattle Show, Worcester, Oct. 9, 1833.

PLOUGHING MATCH.

Ira Barton of Oxford, Chairman; Joseph Davis of Northborough, Benjamin Harrington of Princeton, Hiram Wheelock of Sturbridge, and John Claffin, Jr., of Milford.—Committee.

The Committee on the Ploughing Match report; That there were twenty-one entries of teams, and, notwithstanding the forbidding state of the weather, seventeen appeared upon the field for Ploughing. Convenient lots, of one-eighth of an acre each, were provided in rear of the Insane Hospital, and the work was all accomplished within 47 minutes.

There were eight double, and nine single teams. The double teams performed their work as follows:—Stephen Marsh jr. of Sutton; himself ploughman, and Franklin White, driver—work performed in 27 minutes.

Tarrant Meriam of Grafton; — Meriam ploughman, and Noah Meriam, driver—in 25 minutes.

Harvey Putnam of Sutton; himself ploughman, and Lyman Putnam driver—in 26 minutes.

William Eaton jr. of Worcester; himself ploughman, and Ephraim Gates driver—in 24 minutes.

John Park of Milbury; himself ploughman, and George Park driver—in 29 minutes.

Silas Dudley of Uxbridge; himself ploughman, and Harvey Carlton driver—in 42 minutes.

Lewis Pierce of Sutton; himself ploughman, and James Taylor driver—in 37 minutes.

Elbridge Hewitt of Worcester; Joshua Richardson ploughman, and Elmer Stow driver—in 28 minutes.

But three premiums can be awarded to these eight competitors; and, upon the best consideration the committee have been able to give to their respective claims, they recommend that the first premium of \$10 be awarded to Tarrant Meriam of Grafton, and his ploughman.

The second premium of \$6 to Elbridge Hewitt of Worcester, and his ploughman.

The third premium of \$4 to Stephen Marsh jr. of Sutton.

Some question was made whether Mr. Meriam's ploughman was "a man employed on the owner's farm," agreeably to the rule of the Trustees. But, upon the assurance that he is now, and expects to be, so employed, the committee allowed the team to compete for the Society's premium. The team of Mr. Silas Dudley had strong claims for the third premium, but on the whole, the committee thought it due to Mr. Marsh.

There were nine beautiful single teams upon the field, viz:

Elbridge G. Wheelock of Milbury; Leonard Wheelock, Grafton; Tyler Carpenter, Sutton; Jonas H. Allen, Shrewsbury; Joseph Dudley, Sutton; Nathaniel C. Moore, Worcester; Horatio N. Hair, Worcester; Elbridge Hewitt, Worcester; Arnold L. Allen, Shrewsbury.

The Committee found great difficulty in recommending the premiums to these several competitors. They each and all deserved a premium, and, under ordinary circumstances, would have received it. But your Committee, under the rules of the Trustees, were obliged to select five from the nine, as the objects of the Society's bounty, leaving to the others, the honorable distinction, of having had a part in the best Ploughing Match ever had in the County of Worcester.

The Committee, upon the whole, recommend that the first premium of \$12, for single teams, be awarded to Tyler Carpenter of Sutton.

The second premium of \$9, to Arnold L. Allen of Shrewsbury.

The third premium of \$7, to Leonard Wheelock of Grafton.

The fourth premium of \$5, to Nathaniel C. Moore of Worcester.

The fifth premium of \$3, to Jonas H. Allen of Shrewsbury.

The work of Mr. Carpenter's team, a pair of four year old steers, was truly admirable; and it is praise enough for that of Mr. Arnold L. Allen, that the Committee were divided as to the merits of the two teams, claiming the two first premiums.

The Committee unanimously approve of the liberal encouragement given by the Trustees to single teams; and they would respectfully suggest the propriety of a regulation, by which the ages of the oxen of the double teams shall be limited to four years and under.

Per order,
I. BARTON, Chairman.

SWINE.

Harry Wood of Grafton, Chairman; John Temple of West Boylston, John Clark of Ward, Joshua Richardson of Templeton, and Lewis Bigelow of Worcester.—Committee.

The Committee on Swine, having performed the duties of their appointment, respectfully report, that they have awarded the following premiums:

To Stephen Oliver of Shrewsbury, for the best Boar, \$5.

To Samuel Banister of Worcester, for the next best, \$3.

To Samuel Banister of Worcester, for the best Sow, \$5.

To Simeon Burt of Worcester, for the next best, \$3.

To Simeon Burt of Worcester, for the best Pigs, \$3.

The above being the only Swine exhibited, which the Committee considered entitled to premium.

H. Wood, for the Committee.

BUTTER AND CHEESE.

Samuel M. Burnside of Worcester, Chairman; Joseph D. Sargent of Leicester, David Wilder of Leominster, Samuel Daman of Holden, and Samuel Wood of Grafton.—Committee.

The Committee on Butter and Cheese, submit the following Report:—

Of all the productions of the farmer, which come under the inspection of the public on these

anniversaries, there are probably none, which present more difficulty of just and accurate discrimination, than those which are the subject of this report. Sixty-four lots of cheese of different descriptions, were entered for premium, containing, in all 7851 lbs.: a greater quantity, we understand, than has ever been offered on any former occasion. From such abundance, and such variety of quality, it is obviously impossible, always to arrive at a conclusion, fully satisfactory, which is to designate *one lot* as superior to all the others. There has been, however, but very little difference of *taste* and of course, as little discordance of *opinion* among the members of your Committee, in the examination they made of this article. They inspected separately the several lots, without interchanging their views, until the trial was completed, when the first comparison of their memoranda shewed almost an entire unanimity in relation to the lots, to which the premiums ought to be awarded. Taking them all together, they were of uncommon excellence. But your Committee are of opinion, that Marshall Thompson of Barre, is entitled to the first premium, of \$10, for a lot of 210 lbs. of new milk cheese, the product of the past season; that the second premium of \$7, be paid to Mr. Roswell Converse of New Braintree, for a lot of 102 lbs.; the third premium of \$5, to Mr. John Hunter of New Braintree, for a lot of 117 lbs.; and the fourth premium of \$3, to Mr. Josiah G. Gleason of New Braintree, for a lot of 129 lbs.; the premium of \$7, to Danforth K. Tufts of New Braintree, for a lot of 100 lbs. of *Sage Cheese*; the first premium of \$8, to Mr. John Matthews of New Braintree, for a lot of *Old Cheese*, and the second premium of \$6, to Mr. David Lee of Barre, for a lot of 128 lbs., of the kind last mentioned.

The specimens of *Butter* were not as numerous as heretofore; but in excellence, they were not inferior to any former exhibition. A lot of 20 lbs. offered for premium by Mr. Joseph Richards of Westborough, was unaccompanied by the certificate, required by the rules of the Society, stating the whole quantity made in his dairy, and the number of Cows kept, between the months of May and October. It could not therefore be brought into competition with other lots. The same objection was found applicable to a lot of 50 lbs. offered by Mr. Henry Sprague of Barre. It was thought by your Committee, that both these might have merited a premium, had the necessary information been furnished. Another lot of 25 lbs. entered by Mr. Royal Pickard of Worcester, occupying the farm of the President of this Society, was of excellent quality, and would have come into successful competition, had it not been unpleasantly affected by the vessel in which it was placed. Mr. Pickard is to be considered as *unfortunate* rather than *thoughtless*; the vessel was of Bass wood, recently made, and probably for this particular purpose; and the Committee believe he was not aware that the butter would be influenced by coming in contact with wood of this description. It is here, worthy of remark, that dairy women are generally not sufficiently attentive to the condition of the vessels, in which they set their milk, and make and preserve their butter. Most other complaints about poor butter, may be traced to this source.—They should never forget, that the vessels they use for this purpose should be neat and clean as the *person*, and sweet as the *temper* of a good housewife. Another lot of 10 lbs. offered only for in-

spection by Mr. Francis Grout of Worcester, attracted much of the attention of your Committee. It was made in June last, and was remarkable for its hardness, its sweetness and rich flavor.

Your Committee, with a unanimity which resulted altogether from separate trial, recommend, that the highest premium of \$7, be paid to Mr. Luther Chamberlain of Westborough, for a lot of 21 lbs.; the second premium of \$6, to Mr. Walter Bigelow of Worcester, for a lot of 30 lbs.; and the third premium of \$4, to Mr. Francis Grout of Worcester, for a lot of 27 lbs. They found no lot, entered conformably to the regulations of the Trustees, entitled to the fourth premium, and it has therefore not been disposed of. They cannot refrain from repeating a regret, often expressed by Committees of the Society, that any of our fellow citizens, who come here in friendly, and honorable competition for testimonials of superior merit, as farmers, manufacturers, or mechanics, should deprive themselves of the *possibility* of success, and deprive also the Committees of the pleasure of awarding the meed of merit, by a failure to comply with the salutary and indispensable requisitions of the Trustees. These may be easily known, and easily observed, and ought not to be disregarded by any, who are friendly to the important objects of the corporation.

This failure is the more to be lamented in its application to the products of the dairy, because, if the character of the farmer, *as such*, were to be tested by any two articles, selected as specimens, from all the rest, those from the dairy would be first considered;—for if these be good, they prove, more than any others, the value of the cows, the quality of the breed of neat cattle, the care, neatness, and skill of the housewife, and the general good condition of the whole establishment, within and without. These products, too, if of good quality, are the richest of luxuries; but if poor, or even indifferent, they are not worth the care and expense they require. It was once remarked by a sagacious observer of agricultural improvements, that in judging of the management of a farm, he wished to see nothing but the *barn*.—With equal safety may we judge of all within the house, by tasting of nothing but the *Butter* and *Cheese*.

These suggestions are made, not in the spirit of *fault-finding*, but in the hope of advancing the interests of farmers, by whom, we trust, they will be received in the spirit of candor and kind feeling.

Per order, S. M. BURNSIDE.

SHEEP.

George Folsom of Worcester, Chairman; Alexander De Witt of Oxford, John Jacobs of Milbury, William Williams of Westborough—*Committee*.

Your Committee proceeded to the performance of the duties assigned to them with feelings of peculiar gratification, as well from a knowledge of the excellent qualities of the animal to which their attention was directed, as from a regard to what they consider a valuable source of profit to the community. They are far from concurring in the sentiment attributed to an eminent individual at the South, that "he would go a rod out of his way to kick a sheep;" on the contrary, they are happy to have come a considerable distance from their homes, if for no other cause, to have had the opportunity to form an acquaintance with the fine specimens of that interesting animal exhibited to-day. It will not be expected of them, however,

to consume the time of the Society in stating at length the reasons of their partiality; suffice it to say, they are such as appeal with great force to the comfort and well-being of the *outward* and the *inward* man.

In selecting among the animals exhibited those which were pre-eminently excellent, your Committee met with no little difficulty from the high claims that *all* presented to their favorable notice. The native breed especially claimed their admiration for size and beauty of form, and the excellent character of their wool. Classed among these was a Ram, entered by Mr. Asa Rice of West Boylston, weighing when last sheared, 188 lbs., the fleece included, which weighed 7 lbs. 13 oz. This animal was purchased by Mr. Rice in the town of Gardner, where he was raised, and was represented to him as of the native breed; but your Committee, judging from the appearance of the animal, and the quality of the wool, were unanimous in the opinion that a crossing must have taken place, sufficient to exclude him from the class in which he had been entered. Mr. Seth Wyman of Shrewsbury, offered for the premium a native Ram, $3\frac{1}{2}$ years old, weighing 195 lbs., and altogether a fine animal; but your Committee were of opinion, that, other things being equal, old rams were likely to be less useful than younger ones. They passed, therefore, to a more youthful competitor, entered by Mr. Thomas W. Ward, Jr. of Shrewsbury, remarkable for the fineness of his fleece and the symmetry of his proportions, and awarded him the premium of *five dollars*. The age of this Ram was $1\frac{1}{2}$ years; his weight 164 lbs. Your Committee cannot avoid commending in high terms the animals in this class exhibited by Mr. Aaron Goodale of West Boylston, and Dr. Wilson of Barre.

A fine lot of native *Ewes* was entered by Mr. Daniel Tenney of Sutton, accompanied by a beautiful flock of Lambs, for which the premium of *four dollars* was awarded—no other native *Ewes* being offered. Your Committee hesitated between the native *Wethers* entered by Dr. Wilson of Barre, and those of Mr. Franklin M. Farnum of Carlton, but finally decided in favor of the former, for their size and unquestionable claims to native purity of breed. They have awarded, therefore, the premium of *three dollars*, for the best two native *Wethers*, to Dr. Wilson.

In approaching the animals of foreign extraction, your Committee had first to decide between two Merino Rams, both sufficiently ugly to merit consideration, even if an unpromising exterior had not concealed a fleece of charming fineness and beauty. One of these, owned by Maj. Simeon Burt of Worcester, was an admirable specimen of Spanish gravity and ill-favored proportions; but your Committee, aware that the quality of the coat was the true test of the value of the sheep, although it might not be of the *gentleman*, were under the necessity of passing over his claims in favor of the other animal, whose fleece appeared somewhat the finest, entered by Rejoice Newton, Esq. of Worcester, to whom they awarded the premium of *seven dollars* for the best Merino Ram.

Two lots of *Merino Ewes* only, were exhibited. Those entered by Mr. Newton, were thought entitled to the first premium of *eight dollars*. To the others, entered by Mr. T. W. Ward, Jr. of Shrewsbury, was adjudged the second premium of *four dollars*. All which is respectfully submitted.

For the Committee, GEORGE FOLSOM, *Chairm.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 23, 1833.

BRIGHTON CATTLE SHOW.

THE exhibition of the Massachusetts Agricultural Society on the 16th inst. was attended by a great concourse of spectators, notwithstanding "the dawn was overcast, the morning lowered, and heavily in clouds brought on the day." The Show was interesting in some points, but in others was not equal to what it has been in former years.

The principal cause of the diminished number of animals exhibited at Brighton may, perhaps, be found in the cattle shows in other parts of the State, better adapted to the purposes of the grazier. Another cause may be that fine animals have become so common that they are scarcely considered as a rarity; and those who possess them do not bring them forward, from an apprehension that other animals still superior may be exhibited. The general prosperity of the agricultural interest prevents particular displays; and excellence ceases to be remarkable, when it has become general.

The Ploughing Match was well contested, and gave general satisfaction; as well as the trials of strength of the Working Oxen. The exhibition of Butter and Cheese was excellent and very abundant. In the Society's Hall no cloths were exhibited, but a long table and a large pyramidal glass were filled with the products of the ladies' ingenuity and industry.

The Address of the Hon. EDWARD EVERETT was all that could have been anticipated from the eloquence and erudition of the author; and was listened to with marked admiration by a large audience. The Address was replete with information relative to the early states and stages of agriculture in the different nations of Asia and Europe. The mean and servile condition of the *serfs* and *villains* who formerly in England, and still in Russia, and some other parts of Europe, were and are the operative tillers of the soil, was contrasted with the condition of the cultivators of this country, owners of the soil, and owning no earthly superiors. It appeared to be elaborately composed—every sentence polished to perfection—but was delivered without manuscript, and almost or entirely without notes of any kind.

The premiums awarded by the Committee on Ploughing Matches will be found in their detailed report on the first page of this No. The following premiums also were awarded.

From the Boston Patriot.

Working Oxen.—First premium, \$25, to Arnold S. Allen, Shrewsbury; 2d, \$20, to Isaac Hathaway, Sutton; 3d, \$15, to Peter Putnam, Sutton; 4th, \$12, to James Taylor, Sutton; 5th, \$8, to Stephen Marsh, Sutton.

Fat Cattle.—First premium, \$25, to Fitch Winchester, Southboro', for his brindle ox of native breed, weighing 1993 lbs.; 2d, \$20, also to Mr. W. for his red ox, 5 years old, quarter Admiral, weighing 1875 lbs.; 3d, \$10, to Seth Wyman, Shrewsbury, for his red ox, said to be 6 years old, of native breed, weighing 1910 lbs. [The committee report the mode of fattening to be nearly similar. It commenced in the fall and winter of 1832, with corn, straw and potatoes. In the spring, some grain till grass time and little or none afterwards.]

Bulls.—First premium, \$20, to Levi Hammond, Princeton, for his bull 3 years old; 2d, 10, to

Cassander Gilman, Raynham, for his bull 18 months old.

Bull Calves.—First premium, \$10, to Jacob W. Watson, Princeton, for his calf 6 months old, native and Denton stock; 2d, 5, to Rev. Bailey Loring, Andover, for his calf 5 months old.

Milch Cows.—First premium, \$25, to John Leathe, Woburn; 2d, 15, to Luther Chamberlain, Westboro'; 3d, 10, to Jacob W. Watson, Princeton.

Heifers.—First premium, \$15, to Ichabod Nichols, Salem; 2d, 12, to Rev. Charles Briggs, Lexington; 3d, 8, to Hector Coffin, Newbury.

Sheep.—For the best Dishley Ram, \$20, to Thomas Williams, Chelsea. For the best Dishley Ewe, \$20, to John Prince, Esq. Roxbury. For the best South Down Ewe, \$20, to Samuel Jaques, Jr. Charlestown. [There were no South Down Rams, but some fine ram lambs, which promise much encouragement as to this breed of sheep.]

Swine.—For the best Store Pigs, \$10, to Henry Flagg, Weston; next best, 5, to Ira Burnham, Roxbury.

Butter.—First premium, \$20, to Luther Chamberlain, Westboro'. [The committee did not think any other butter offered sufficiently good to entitle it to the 2d premium.]

Old Cheese.—First premium, \$20, to John Hunter, New Braintree; 2d, 15, to John Matthews, New Braintree.

New Cheese.—The premium, \$10, was awarded to Moses M. Warner.

For the greatest quantity of Butter and Cheese between the 15th of May and the 1st of October, \$20, to Luther Chamberlain, Westboro', being 3186 lbs. of Butter and 5245 lbs. of Cheese, from 27 Cows fed on grass only.

Domestic Manufactures.—The committee reported that no articles were exhibited to which they felt authorized to award any of the premiums offered. The committee awarded gratuities to the amount of \$25, as follows:—to Jona. H. Cobb, Dedham, silk articles, \$5; Miss Susan Maria Bent, Cambridge, hearth rug, 3; Adam Brooks, Scituate, silk handkerchiefs and sewing silk, 3; Miss Sarah E. Etheridge, Dedham, woven straw bonnets, 3; T. W. Wellington, Lexington, rug and two veils, 3; Miss Pamela Pond, Medway, straw bonnet, 2; Miss Abigail Pratt, Oxford, household worsted, 2; Miss Emeline Eaton, Mrs. C. Wheeler and Miss M. Rice, Framingham, straw bonnets, \$1 each; A. Randall, Braintree, straw bonnet and bed spread, 1.

Inventions.—To Messrs. Newhall & Willis, of the Agricultural Warehouse, Boston, a premium of \$5, for Scot, Keith & Co.'s Iron Pump; \$5 for an improvement in Willis' straw cutter; and \$10 for a self operating cheese press. [These gentlemen exhibited several other articles which will be mentioned in the detailed report of the committee.]

To Adam Brooks, Scituate, for his Silk Spinner and Twister, \$20.

To Carver Washburn, Bridgewater, for his improved cast iron Hubs, with their axletrees, \$5.

To Nathaniel S. Bennet, for wrought iron Cattle Bows, \$2.

ITEMS OF INTELLIGENCE.

Gen. Shelby, of Lexington, Ky. sold lately a flock of 160 mules, raised on his plantation, for \$11,840, cash in hand; and fourteen of them were purchased for a gentleman at Cuba, \$136 dollars each.—The Lexington Intelligencer calls this 'agricultural thrift.'

Mr. Durant, the Aeronaut, took a second flight from Baltimore, on Monday last, being his ninth aerial tour. At 23 minutes past 4 P. M. the adventurous traveller took his departure from Baltimore, with an intention to cross the Chesapeake Bay and take tea at Chestertown. After a pleasant passage, during which he held conversation from his aerial position with a number of travellers by land and water, he arrived within a mile of the Eastern Shore, where his air ship being becalmed, he hove to at 15 minutes past 6, anchored in 151 feet of air, and was finally taken on board the steamboat Independence, Captain Pearce, where he found good company and comfortable quarters.—*Delaware State Journal.*

The Crops. All accounts of the crops, from Kamouraska downward, concur in saying that they must prove extremely deficient. Indeed, different gentlemen from those parishes state, that in several of them they have altogether failed, and the inhabitants will be as distressed as they were in 1816, when they were relieved by the Legislature. The cause of the failure was the general low temperature of the season, and the early frosts.—*Quebec Gazette.*

New Improvement. A machine has recently been constructed by a Mr. Job White of Belfast, Maine, by which a saw, of the proper form, is made to operate lengthwise of the log, cutting round it, and approaching the centre in a spiral direction, in such a manner as to cut the log into one continuous board. The board unwinds from the log, like the cloth from a weaver's beam.—This invention will be of great value to carriage makers, who use bass-wood boards for pannels, as they may be cut from much smaller, or even hollow logs.

Beets. An ebony gentleman, better known as the disseminator of M'Cracken's imitation of the High Holborn, brought us three beets, the other day, whose total weight was twenty-eight and a half pounds. The largest of the three weighed thirteen pounds and eight ounces. They are of the kind called White Scarcity, grew on ground belonging to Mr. Daniel Emerson, and were cultivated by this knight of the lather pot, and blacking brush.—*Newport (N. H.) Spectator.*

Wheat imported into America from Europe. A circular from H. Gates & Co. of Montreal, under date of 4th inst., communicates the fact that 40,000 bushels of wheat had arrived in Montreal direct from Archangel, that one or two more cargoes were expected, and consequently that American wheat and flour were depressed in price.—This is a new and unexpected competition with our agriculturists.

More "Barrenness." We have before us three fine peaches, just taken from a "tree of native growth," which stands in quite an exposed situation of the western part of the town, on land belonging to Mr. Mark Folger, which peaches measure in the aggregate, 24 inches in circumference. We have also several large strawberries, fully ripe, plucked yesterday from a bed in the garden of Mr. S. Burnell, being of the second crop this season.—*Nantucket Inquirer.*

Exhibition. The New York Gazette says—We spent an interesting hour yesterday at Masonic Hall, in examining the variety of American Manufactures, to which an impulse has been given by the American Institute.—So perfect is each specimen, that it is difficult to determine where to begin, and how to terminate any thing we might say in praise of the ingenuity of our manufacturers. For our part, we are of opinion that every thing displayed in the Halls, was entitled to a premium; and yet a more correct decision will probably be made by the gentlemen appointed to make the award.

The Harvest. All accounts from the country speak of the harvest as having been generally plentiful. The wheat crop has not, in some districts, been as abundant

as had been anticipated, but the return will still be above an average. The favorable change in the weather within the last two days has been extremely favorable to the labors incident to this season. The harvest is completely over in England, and the numerous swarms of Irish laborers who had emigrated to England a few days since are returning daily.—*Dublin Times*.

To Correspondents.—"The Crusaders at the holy sepulchre," is received and shall appear in our next.

WM. PRINCE & SONS,

—Deeming it unnecessary to have any Agent, request all orders to be sent to them *direct per mail*, and they will receive prompt attention, and be forwarded precisely as desired. Catalogues will be sent gratis to every applicant.

N. B. *Morus Multicaulis*, or Chinese Mulberry, \$25 per 100, and \$4 1-2 per dozen.

Linnæan Botanic Garden and Nurseries,
Flushing, Oct. 8th, 1833. o 23

COUNTRY SEAT AT AUCTION.

To be sold at Auction, on Wednesday, November 6, at 11 o'clock, on the premises, (unless previously disposed of at private sale) the estate of the subscriber, situated in upper Beverly, called Cherry Hill, four miles from Salem, and about seventeen from the city of Boston, consisting of 200 acres of tillage and pasture land in good condition, with the dwelling-house, barns, out houses, and other buildings thereon situated, including several lots of wood land, peat meadow, &c. The view from the dwelling-house is extensive and commanding, and embraces, beside the towns for many miles in the interior, the whole of Massachusetts Bay, from the Light House on Baker's Island, to Nahant and the islands adjacent. The fruit trees are numerous and of great variety, having been selected with much care and attention, for the last thirty-five years. The property is a desirable one for farming purposes, or as a pleasant and convenient country residence.

At the same time, will be sold the live stock, farming utensils, and produce; consisting of oxen, cows, horses, wagons, carts, ploughs, potatoes, corn, hay, &c.

Also, a Pew in the Meeting-house. Enquire of Mr. Wm. NUTTER, on the premises, or of STEPHEN WHITE, No. 7 Somerset Street, Boston. oct 23.

COWS, FARMING, AND GARDEN UTENSILS, &c. AT AUCTION.

The subscriber will sell at Auction, at his place in Dorchester, at 1 o'clock, P. M. on Thursday, the 31st inst.—6 first rate COWS, 3 of them will come in in December.

1 Horse Cart, 1 Horse Wagon, for marketing, 1 Milk Cart, (new last spring) 1 Hay rigging, 1 Small Wagon, with canvas top, 1 Harrow, 2 Ploughs, &c. 1 Booby Hack, for one or two horses. 1 Sleigh, Harnesses, Saddle, Bridles, Whips, &c.

Also, a variety of Farming and Garden utensils, which are too numerous to mention. From 12 to 15 tons of English Hay, a few tons of Mangel Wurtzel, which is very good for stock.

Also, a few bushels of Potatoes and other vegetables.

The sale will be positive, as the place was sold on the 2d of September last. JOHN SWETT.

EBENEZER EATON, Auctioneer.
Oct. 23, 1833. 2w

BUCKTHORNS.

Buckthorns for Hedges for sale at \$3 per 100 for large ones, and small thorns in proportion, by G. C. BARRETT.

N. B. These are the genuine thorns, raised upon the farm of E. H. Derby, Esq. o 23

WINTER BARLEY.

A few bushels of this valuable grain for sale at this office. The great advantage of this grain is, it enables the farmer to lay down his land in the autumn, when he is not so much hurried, and when the land is generally in a better state for leaving it smooth, than in the spring. This has been successfully raised for the last four years in the eastern part of this State, and stands the winter admirably. 2w o 23

WANTED.

IN the vicinity of Boston, an experienced Gardener, thoroughly acquainted with the propagation and care of Green House Plants, and the management of Vineries, to whom the highest wages will be paid—satisfactory information, as to capacity and character, will be required. Apply at this office. sept 25

WANTED.

HERDS GRASS, CLOVER, RED TOP. Of the growth of 1833 and of good quality.

Also—Flax and Hemp seed, for which cash will be paid. oct 9

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus Multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Pæonies*, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

FRUIT AND FOREST TREES, &c.

BLOODGOOD & CO. have for Sale at their Nursery at Flushing, L. I. near New York, a large assortment of the most approved American and European sorts of Apple, Pear, Peach, Cherry, Plum, Apricot, Nectarine and Quince Trees, hardy Ornamental Trees, flowering Shrubs and Plants, of almost every description usually kept in Nurseries. Of the *Pear Trees* they have a large stock and of good growth, amongst which are most of the celebrated new sorts. About eight thousand of the *Morus Multicaulis* Mulberry Trees, so much esteemed for the feed of the Silkworm, which they will sell at Twenty-five Dollars per hundred. To Nurserymen who want to increase their stock or to sell again, liberal discount is made, excepting on the *Morus Multicaulis*. The *Fruit Trees* in this Establishment are all grafted or inoculated by the Proprietors, who feel confident in their being correct. Orders forwarded by mail to THOMAS BLOODGOOD, No. 208 Front Street, New York, or to BLOODGOOD & Co. Flushing, L. I. will be particularly attended to. Catalogues may be had of Geo. C. Barrett, at the Agricultural Warehouse, No. 52 North Market Street. 3t o 16

PEACOCKS.

TWO pair of beautiful Peacocks for sale, price \$10 per pair—these are beautiful Birds and unlike most of the domesticated fowls a benefit rather than injury to grounds and gardens, as they destroy insects without injuring vegetables or plants—enquire at the office of the New England Farmer. 2t oct 16

NEW ENGLAND SEED STORE, AND HORTICULTURAL REPOSITORY.

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS, upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country: these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

[Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

N. E. Seed Store, connected with the N. E. Farmer Office, No. 51 & 52 North Market-st. GEORGE C. BARRETT. oct 16

BRIGHTON MARKET.—MONDAY, OCT. 21, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 3650 Beef Cattle, 125 Stores, 4400 Sheep, and 465 Swine.

PRICES. *Beef Cattle*.—Former prices were not supported; we noticed a few very fine, which had been previously contracted for, taken at \$5 50, and a small number at 5 25. We quote prime at 4 75 \$5; good at \$4 25 a 4 50.

Stores.—Very few sales noticed.

Barrelling *Cattle*.—Purchasers refused to pay last week's prices; several lots unsold. We quote mess 4 a 4 12; No. 1, 5 50 a 3 62; No. 2, 3 a 3 25.

Sheep.—We noticed sales at \$1 42, 1 62, 1 75, 2 00, 2 25, and 2 50.

Swine.—One lot of 70 Barrows at 4 3-4; one of 60 Sows to close, at 3 1-2; one lot of Sows and Barrows at 4 1-4, and one lot at 4 1-2. At retail, 4 1-2 a 5 for Sows, and 5 1-2 and 6c for Barrows.

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

MISCELLANY.

From the Dublin University Magazine.

SUMMER RECOLLECTIONS.

'Tis sweet—'tis sweet—the summer dream
That haunts us in our winter hours;
The murmur'd music of a stream,
The voice of birds—the breath of flowers,
And the warm breeze that lightly leaves
The waters, and the whispering leaves.

There is a dream, more sadly sweet,
When summer years of youth return;
And hearts, that we no more may meet,
As fondly beat, as truly burn,
And eyes weep back to us awhile,
The sadness of their parting smile.

It comes, like music heard at night,
Like dew upon the drooping flowers,
Like morn's first dawning to their sight
Who darkly dwell in icy bowers,
To him who long hath felt depart
The light of hope, and bloom of heart.

Not yet—not yet—the summer bloom
Of my young heart had died away:
There is a twilight in the gloom,
A lingering smile—a farewell ray
A hope of rapture, kindling yet,
A halo from the sun that's set!

FEMALE EDUCATION.

LET your first care be to give your little girls a good *physical* education. Let their early years be passed, if possible, in the country, gathering flowers in the fields, and partaking of all the free exercises in which they delight. When they grow older, do not condemn them to sit eight listless hours of the day over their books, their work, their maps, and their music. Be assured that half the number of hours passed in real attention to well ordered studies, will make them more accomplished and more agreeable companions than those commonly are who have been most elaborately finished, in the modern acceptance of the term. The systems by which young ladies are taught to move their limbs according to the rules of art, to come into a room with studied diffidence, and to step into a carriage with measured action and premeditated grace, are only calculated to keep the degrading idea perpetually present, that they are preparing for the great market of the world. Real elegance of demeanor springs from the mind; fashionable schools do but teach its imitations, whilst their rules forbid to be ingenuous. Philosophers never conceived the idea of so perfect a vacuum as is found to exist in the minds of young women supposed to have finished their education in such establishments. If they marry husbands as uniformed as themselves, they fall into habits of insignificance without much pain; if they marry persons more accomplished, they can retain no hold of their affections. Hence many matrimonial miseries, in the midst of which the wife finds it a consolation to be always complaining of her health and ruined nerves. In the education of young women we would say—let them be secured from all the trappings and manacles of such a system; let them partake of every active exercise not absolutely unfeminine, and trust to their being able to get into or out of a carriage with a light and graceful step, which no drilling can accomplish. Let them rise early and retire early to rest, and trust that their beauty will not need to be

coined into artificial smiles in order to secure a welcome, whatever room they enter. Let them ride, walk, run, dance, in the open air. Encourage the merry and innocent diversions in which the young delight: let them, under proper guidance, explore every hill and valley: let them plant and cultivate the garden, and make hay when the summer sun shines, and surmount all dread of a shower of rain or the boisterous wind; and above all, let them take no medicine except when the doctor orders it. The demons of hysteria and melancholy might hover over a group of young ladies so brought up; but they would not find one of them upon whom they could exercise any power.—*Foreign Quarterly Review.*

EXCELLENT IN A CLERGYMAN, BUT BAD IN A HORSE.

THE Rev. Mr. S. some years since pastor of the Church at Manomet Ponds, had while resident there, a young horse, which, from his frequent flank and oblique movements, and sudden side springs, from his proper course, *in medias res*, was not exactly suited to the wishes of his owner. In some correspondence upon a sale of the animal, with the Rev. Dr. A. the latter made inquiry as to the "moral character" of the horse. In reply, Mr. S. after summing up the various characteristics "wherein he was worthy" thus concluded; "I must confess, however, that he has one trait, which, although very excellent in a clergyman, is very bad in a horse; he avoids even the appearance of evil."

FAT AND LEAN.

AN Irishman who had a pig in his possession, was observed to adopt the constant practice of filling it to repletion one day, and starving it the next. On being asked his reason for doing so, he replied, 'Och! sure and isn't it that I like bacon with a strake o'fat and a strake o'lean, equally after t'other.

Tom Lout was once troubled with the fever and ague. A friend asked his physician how he was. He said that the fever still hung by Tom, but the ague had left him, because he was too lazy to shake.

Making use of a Friend. 'I've broken your rotten wheel-barrow usin on't, you'll please to get it mended right off, I'll want to borrow it agin this afternoon.'

'Friend, it shall be repaired and sent to thee.'

A NOTABLE VISITOR.

AMONG the visitors to Forrest's exhibition on the Colton hill, the other day, was Mrs. Butler, the venerable matron, and who completed her 105th year in June last. She expresses herself highly delighted with Mr. Forrest's kindness and attention, he having *beau'd* her to the foot of the hill, and invited her back with her young daughter, who is only 80 years of age, an invitation which the old woman readily promised to accept.—*Edinburgh paper.*

MAMMOTH FRUIT.

WE have been presented by Joel Flagg, of West Boylston, about 4 miles from this village, with six pears which weigh *six pounds and a half*. The largest of them measures 5 inches in length, and 13 in circumference, and weighs 22 ounces. They are now ripe, and are a good pear for eating. We do not know the name. They may be seen at this office.—*Worcester paper.*

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. Merino, a very superior article, and all the most desirable colors, imported expressly for the subscriber—4 cases 3-4 Eng. do, of various colors and qualities—4 cases Circassians, very superior qualities and various colors—1 case superior Goats Hair Camblet—4 bales 4-4-5-4 and 6-4 Boeking, green and mixed—12 bales splendid Tarrillville Hearth rugs—5 bales Eng. low priced do. do.—54 bales Dometts, white, yellow, red, &c.—10 bales Flannels, Eng. Welsh, and American—10 bales Cotton Carpeting, striped and blocked—6 bales Russia Diaper—1 bale Canton Flannel, lower than the cost of importation—3 bales American Cotton Flannels, bleached and unbleached—1 bale White Counterpanes, all sizes—10 bales superior London Row Blankets from 10-4 to 14-4—7 bales real Indigo Checks from 3-4 to 5-4—3 bales American Gingham—2 cases Eng. Gingham—29 bales cotton Batting—25 bales Pillisse Wadding, 12 bales black Wadding—5 cases Embossed Furniture Dimety—2 cases Embossed Cambrick, for stage lining—20 cases Prints, all patterns and prices, Eng. French, and American—35 cases Bleached Cottons—50 bales unbleached cotton—10 bales Ticking 3-4, 7-8 and 4-4, some very superior quality—2 cases Simchaws—2 cases Sarsnets—2 cases Satin Levantines, superior quality—3 cases Levantines, low priced—7 cases Crape Dresses, all colors—5 cases Linens, Lawns, and Shirts 4-4 to 10-4 with a very extensive assortment of Cambrics and Cambric Muslins, Bobbinette and Grecian lace, 4-4 and 6-4 Swiss nonsook, Rook Jacquett plain and figured muslins—Hosiery and every variety of seasonable Dry Goods.

Country merchants will do well to call and examine for themselves. sept18.

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flected. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Coelebs, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. opt

YOUNG MEN AND YOUNG WOMEN.

COBBETT'S ADVICE to Young Men, and incidentally to Young Women, in a Series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a Subject—268 pages, price 56 cents—for sale at the N. E. Farmer office, 52, North Market street. aug 28

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

COMMUNICATIONS.

For the New England.

PRUNING THE ISABELLA GRAPE VINE.

"PRUNING THE VINE. Well, neighbor, how does your Isabella promise this season? Not a single grape. Ah, how is that? We sent for Mr. M. last fall—he pruned it so closely that the branches looked like naked sticks, and now we have not a grape to gratify our palate.

"Close pruning is too common in this country; in summer only the unproductive shoots should be taken out, and not these unless they produce too much shade."—*New York Farmer.*

THE above appeared in Vol. XII, No. 10, and I regret to see such pieces inserted in a standard paper like yours without comment from the Editor. If this sarcasm on pruning shall pass as deserved, much injury will result to the cause you have evidently at heart: I mean the successful culture of native and other hardy vines. "Mr. M." knew nothing of his business, or the vine had exhausted itself in the previous year's bearing. Any Isabella (and most other hardy vines) pruned judiciously every year according to the age, vigor and general growth of the plant, and depth and strength of the soil, will, every year produce a good crop, much superior to any thing from a vine only slightly pruned in the summer. The reason is obvious to any who have studied the nature of the vine, and attended carefully to its cultivation in this country. It should be divested of its surplus branches in the summer, to admit the light and air to ripen the wood as well as the fruit. An experienced cultivator will be as particular in exposing the branches which are to bear freight the following season, as to any other part of cultivation. Grape vines have a constant tendency to throw out lateral shoots, and if the branches which are intended to furnish the next crop of fruit are not divested of those as they appear, their strength will be found exhausted; and if any fruit appear, its quality will be very inferior.

As soon as the buds are developed in the spring a vine stops bleeding; and in the spring we can cut out all the wood which has perished during the winter, of which there will be a quantity on every vine native or exotic, and it cannot be expected that the late growth should ripen sufficiently to stand a severe frost. I prefer pruning in the spring, because we can then make clean work, and lay in only fine ripe wood; and by doing this work a short time before the buds put forth, the plant receives no injury from bleeding. Most foreign vines will become acclimated and hardy by a discriminating use of the knife.

If you deem this communication worth insertion, I may probably make more remarks on this subject.

PORT CARBON, PA.

MASS. HORTICULTURAL SOCIETY.

PROCEEDINGS

Of the Massachusetts Horticultural Society, at a meeting held at the Hall of the Institution, Oct. 19th, 1833.

THE President read the following letter, and stated that the wine therein named was the only specimen he had ever tasted, of American production, from the fruit of either foreign or native

vines, which was the pure juice of the grape, without the reinforcement of sugar or spirit; and that it not only resembled, in color and flavor, those from the vintages of the Rhine, but even rivalled some of the varieties of that region; which have been imported to a considerable extent within a few years, and are now so generally drank and so highly appreciated in this country.

Cincinnati, Oct. 7, 1833.

Dear Sir, I sent you by private conveyance two bottles of wine of last year's vintage, made from a native grape. Some of my friends had purchased of Boller of N. York, some of his Rhenish Cabinet wines; for which they paid him 15 to \$36 per dozen. I bantered them to place them in competition with my domestic wine, at our late fair. The Society appointed a special committee of wine merchants and connoisseurs. I am not certain whether 10 or 12 of the committee attended. Three bottles of the same size and shape were submitted; one containing Johannesberger, one Geisenheimer, and the third a domestic wine from a native grape, the same I sent you. They were ignorant of the contents of each bottle, and were left alone to make up their decision. When the company were admitted, it appeared all but two had decided in favor of the bottle containing the domestic wine. The principal importer of the Cabinet wines was present, and the three samples were submitted to him, and he selected the same bottle. The domestic wine was of the same color and character, but in flavor and aroma *sui generis*, having the flavor of the fruit. But my object in this letter was not to detail this result, but to express my fears that the wine sent you was received by the committee in the heat of summer. The fair was only 5 miles from the city, but I found the wine I sent in a partial state of effervescence, and would willingly have avoided the time, had it not been too late. I am anxious to hear from you, for should the wine sent you have been injured I shall send you a sample of the same wine as soon as the weather is cool.

We have nearly completed the vintage at one of my vineyards, containing about 4 acres; but a part of the vines are too small to bear. My vine-dresser's estimate was 2000 gallons, my own 1500. It will not fall short of my estimate. His portion of the wine (one half) is made with less care than mine, yet he has refused 87½ cts. per gallon, offered by the keepers of our coffee houses, for the whole of his wine. He sold at that price last year. Very respectfully, N. LONGWORTH.

EXHIBITION OF FRUITS.

Saturday, Oct. 19th.

Apples. From Mr. Whitmarsh, Brookline, very fine large red apples. Mr. John Perkins, Essex, seedling apples, very fine. Mr. John A. Kenrick, two sorts of apples. Mr. Joel Dakin, Sudbury, Garden Royal, good. Dr. Russell of Lincoln, seedling apples, good. Mr. E. M. Richards, Dedham, Boun's Imperial Russet, and two varieties unknown. Mr. E. Bartlett, Gloria Mundi, and Fall and Golden Pippin apples. Mr. Richardson, Dorchester, chesnut apple (French), French Russet apple and the Harvey apples, good. Mr. John Perry, Sherburne, native apples, good.

Pears. Mr. Wm. E. Payne, Waltham, seven varieties pears, names unknown, not in eating. Mr. Wm. Oliver, Dorchester, Muir Fowl's Egg, true sort. Mr. E. Bartlett, Dorchester, striped, long green of Cox, Chaumontelle, St. Germain, and Brown Beurre pears. R. Manning, Salem, a French pear, name unknown.

Peaches. From Mr. John Mackay, Weston, fine Clingstone Seedling peaches. Mr. E. M. Richards, Dedham, Heath Clingstone of Cox.

Grapes. From Mr. Joshua Child, Boston, four fine large bunches grizzly Tokay grapes. Mr. E. Vose, Dorchester, Black Muscat, Violet Muscat, White Muscat and Grey Muscat, all excellent. Dr. S. A. Shurtleff, Boston, his fine Seedling grapes. Mr. J. Balch, Roxbury, Black Hamburg grapes, girdled, the largest berries exhibited from open culture. For the Committee, B. V. FRENCH.

Saturday, Oct. 26th.

By Mr. Vose, *Passe Colmar* and *Napoleon* Pears estimable varieties.

By Mr. MANNING, first and second crop of *Passe Colmar* and *Doyenne Gris* pears. Also *Bleecker's Meadow*, which promise well, (received from Messrs. James Bloodgood & Co. Flushing, N. Y. and *Per-sique* Peaches (of Cox.)

By Mr. V. FRENCH, a very large and beautiful specimen of the *Chaumontelle* Pears, and a variety of large *Quinces* from French trees, names lost.

By Mr. J. BALCH, Roxbury, very large and fine clusters of girdled *Catawba* Grapes. Also, *Bland's Madeira*.

By Mr. SAMUEL HASTINGS, Boston, *St. Michael* Pears, fair and handsome.

By Mr. J. WINSHIP, (received from Dr. Joel Burnett of Southboro,) large Seedling Pears, which the Committee have named the "*Burnett Pear*." Also, by the same, *St. Germain* Pears.

By Mr. P. WARE, Franklin, *St. Michael* Pears.

By Mr. FRANCIS AMORY, Milton, Pears, name unknown, not in eating.

By Mr. JAMES WADSWORTH, Geneseo, N. Y. uncommonly large *Seckle* and *Baking* Pears.

By Mr. POND, *Isabella*, handsome *Catawba*, and *Pond's fine Seedling Grapes*.

By Mr. THOMAS MASON, a basket of handsome *Peaches*.

By Mr. BENJ. WELD, Roxbury, small *Seedling Apples*, of rather delicate flavor, the first year of bearing.

By Mr. BENJAMIN WHEELER, Framingham, two varieties of *Apples*, names unknown; one was considered a good eating fruit, and the other fit for culinary purposes.

By Mr. FAY, raised in the garden of Mr. SYMES, Charlestown, a *Pound* pear weighing 28½ oz.

Per order of the Committee on Fruits, &c.

E. M. RICHARDS.

VEGETABLES EXHIBITED.

By Mr. D. HAGGERSTON, from the Society's garden, Mount Auburn, *Carote Violette*, seed from the London Hort. Soc.

By Mr. GEO. NEWHALL, Dorchester, a *Sugar Beet*, weighing 23 lbs.; it weighed when taken from the ground with the top 31 lbs.

By Mr. P. B. HOVEY, Jr. Cambridgeport, *Purple Brocoli*, the largest and handsomest ever exhibited at the rooms of the Society. E. M. R.

*From the American Orchardist.***GATHERING AND PRESERVING FRUIT.**

VARIOUS theories have been offered for preserving apples in a sound state for winter use, or for distant voyages. Some have proposed gathering the fruit before it is ripe, and drying it on floors before it is put up: this has been tried; apples lose their sprightly flavor, and keep no better than by some less troublesome modes. Dr. Noah Webster has recommended that they should be put down between layers of sand that has been dried by the heat of the summer. This is, without doubt, an excellent mode, as it excludes the air, and absorbs the moisture, and must be useful when apples are shipped to a warm climate. But apples thus preserved are liable to imbibe an earthy taste.

Chopped straw has also been highly recommended to be placed between layers of fruit; but I have noticed that the straw, from the perspiration it imbibes, becomes musty, and may do more hurt than good. When apples are to be exported, it has been recommended that each be separately wrapped in coarse paper, in the manner oranges and lemons are put up. This is, without doubt, an excellent mode. And Mr. Loudon has recommended that apples destined for Europe should be packed between layers of grain.

Great quantities of winter fruit are raised in the vicinity of Boston, and put up for the winter use, for the market and for exportation. The following is the mode almost universally adopted by the most experienced. And by this mode the apples, under very favorable circumstances, are frequently preserved in a sound state, or not one in fifty defective, for a period of seven or eight months. The fruit is suffered to hang on the tree to as late a period as possible in October, or till hard frosts have loosened the stalk, and they are in danger of being blown by high winds; such as have already fallen are carefully gathered and inspected, and the best are put up for early winter use. They are carefully gathered from the tree by hand, and as carefully laid in baskets. New, tight, well seasoned flour barrels from the baker's, are usually preferred; the barrels being quite filled are gently shaken, and the head is gently pressed down to its place and secured. It is observed that this pressure never causes them to rot next the head, and is necessary, as they are never allowed to rattle in moving. No soft straw or shavings are admitted at the ends; it causes mustiness and decay. They are next carefully placed in wagons and removed on the bulge, and laid in courses in a cool airy situation, on the north side of a building, near the cellar, protected by a covering on the top of boards, so placed as to defend them from the sun and rain, while the air is not excluded at the sides. A chill does not injure them; it is no disservice; but when extreme cold weather comes on, and they are in imminent danger of being frozen, whether by night or by day, they are carefully rolled into a cool, airy, dry cellar, with an opening on the north side, that the cold air may have free access—they are laid in tiers, and the cellar is in due time closed, and rendered secure from frost. The barrels are never tumbled or placed on the head. Apples keep best when grown in dry seasons and on dry soils. If fruit is gathered late, and according to the above directions, repacking is unnecessary; it is even ruinous, and should on no account be practised, till the barrel is opened for use. It has been fully tried.

*From the New-Hampshire Spectator.***CULTURE OF SILK.**

THE culture of silk has of late been suggested to the American people as affording a prospect of reward to the cultivator of the New England or the Eastern States. If you think the following experiment worth an insertion in your paper, you may oblige some who wish for more information on this subject. I have made an experiment personally, and can attest the truth of every item that I communicate, for I have kept an exact diary of the whole experiment, and the result. I may be permitted to say in the outset, that I never have had an opportunity of attending any silk worm establishment, and all the previous knowledge I have ever had, before commencing the experiment, was in 1831. I saw one silk worm in the action of winding, and one other on the shelf, nearly ready to ascend the bushes to winter; and in 1832, one or two hundred about ten days old, reared by those who had no previous opportunity of seeing the development of the silk worm, and were as unlearned as myself. This fact is only hinted at to prove that any person may, by diligent care, raise silk, if they never were acquainted with the art; yet, to make it profitable in the end, as in every other species of cultivation, a complete knowledge of the subject is undoubtedly necessary.

On the 20th June last past, my eggs were hatched. I counted out 1500, and a few more to supply the place of those that should die in the several stages, say from 50 to 100. These were uncoultured. My calculation was to raise about 1500. By reason of the cold and rainy summer, the worms were retarded in their growth, as will always happen—warm and dry weather being the climate suited to the full perfection of the worm, and facilitates its growth and maturity; yet, the food in either case, will be about the same—the only difference will be the length of time required for the insect to eat the same quantity of leaves. The first cocoon was wound on the 38th day of the age of the silk worm. After the fourth moulting, or in other words, shedding of their skin—for they skin four times during their life before they commence winding their balls or cocoons—they are usually about ten days in winding up their cocoons. Previous to their moulting the fourth time, I counted about 1450; so that 50 had died out of the 1500, beside the worms I held in reserve above stated. Of these 1450 worms, beside those that died during this last age of the worm, and during their winding, I counted 912 that remained on the shelves on the 40th day—585 on the 42d day—303 on the 43d day—186 on the 44th day—90 on the 45th day—43 on the 46th day—26 on the 47th day—13 on the 48th day. In ten days from the beginning of winding, all had wound their cocoons, except 13 worms. In four days more, these were all wound. The whole time the silk worms were progressing through their several ages, each age designated by their moulting, including the winding, was 53 days—the usual time is from 42 to 45 days—retarded no doubt from the cold and dampness of the season. There died in the whole 257, during the several ages, till the completion of the cocoons. I had 1243 cocoons of all descriptions, and but few, say 15, that would not reel off. The reserved uncoultured worms are not included in this estimate.

The weight of cocoons before reeling, and as soon as they were picked from the bushes, weighed 4 lbs. 5 oz. 20 cocoons weighed precisely 1 oz.

| | |
|------------------|------------|
| Raw reeled silk, | 6½ ounces. |
| Raw silk, | 1¼ ounce. |

Making the whole product of silk nearly one half pound.

The weight of leaves consumed and wasted, was 75 lbs.

After I had found the quantity of leaves the 1500 worms consumed, I made a comparison with a statistical table communicated in a letter to the 20th Congress of the United States, by Hon. James Mease, on the method of rearing silk in Bavaria, and found by this table 20,000 silk worms consumed 1000 lbs. mulberry leaves—exactly corresponding to 75 lbs. for every 1500 worms—and that from 7 to 10 lbs. of cocoons make a pound of raw or reeled silk—from this estimate the product of my experiment nearly coincides, for 4 lbs. and 5 oz. produced 7½ ounces of silk. Nor does this estimate of the consumption of leaves and the product of silk, materially differ from the estimate and exact result of Count Dondolo—transmitted to Congress by the Hon. Richard Rush, then Secretary of State.

It will readily be perceived that the rearing of silk worms in our State is practicable, and with due management equals the product raised in Bavaria, and the careful management in the extensive laboratory of Count Dondolo, where eight ounces of eggs, or 160,000 worms are reared. In this laboratory the leaves are chopped, the thermometer regulates the temperature, and the pyrometer the dampness of the atmosphere; and every measure of precaution used to secure the worms from disease—by ventilation, by stoves, and by cleanliness. On reading these treatises, and observing all the nice directions contained therein, any person would almost shrink from the task, and become discouraged before they attempted to enter a field where so many obstacles seemed to threaten him. I have chopped no leaves—made no fire but once or twice, and then when the weather was extremely cold and damp for the season. I gave them what they would eat, and they appeared to know what to do with the leaves as well as any other insect, and not more at a loss about it.

I am fully of opinion that the culture of silk is as easily learned as any other kind of business or art—and that many families in every town would find as profitable reward for their labor as our rich farmers do, by correspondent care and exertion.

ELIAS FROST.

Plainfield, August 27, 1833.

QUEBEC AGRICULTURAL REPORT, FOR SEPTEMBER, 1833.

THE weather this month has been colder than usual, with rain at intervals of about a week. The first frost was on the night of the 2d of the month, and on the two following weeks there were several nights during which ice was formed. Towards the close of the month the weather became warmer, and no further frost was observed till the night of the 30th.

The effects of these frosts, which have extended from the Gulf of St. Lawrence to Pennsylvania, have given the country the appearance usual a fortnight later. Tender plants have been more or less injured; the leaves of the forest trees have assumed the rich, brilliant and changing colors of decay, and many trees are already quite stripped of their leaves.

The weather, upon the whole, has been favorable for harvesting such of the crops as were ripe; but the cold prevented all that were late from ripening, and extensive fields have been injured by the frost. Peas have not ripened, and will prove a bad crop. Below the Island of Orleans, it is the same with a great part of the wheat. Above Quebec, it is hardly an average; and more of it is injured by the worm in the grain than was at first imagined. Oats were fine and abundant, but a great many fields which were still green have suffered greatly by the frosts, or have been cut unripe.

Potatoes are the best crop, and have not suffered materially. They will be a full average. Turnips, which are but little cultivated, particularly the *Swedish* or the *Choix de Siam* of the country, set out early, prove productive, and form an excellent aid to a scanty hay crop.

The pastures have suffered by the frost, and have turned brown where the land is not in good condition. The live stock is, however, yet in good order; but the produce of the dairy, which has been about an average this year, is prematurely diminished.

The finer produce of the garden has failed. Upon the whole, garden stuffs will not keep up to the promise of the earlier part of the season. Every thing fails in coming to maturity. The produce of the orchards is an average in quantity, but inferior in quality.

Nothing but great economy and good management will enable the agriculturist to make the returns of the year meet his most necessary wants, till the labors of another season enable him to raise a fresh supply; and the inhabitants of the towns, unless they have saved something from summer's work, will find themselves hard pressed.

Quebec, 1st Oct. 1833.

HORSEMANSHIP.

The Principles of the Art of Modern Horsemanship; by M. Lebeaud: Translated from the French, by D. J. DESMOND, Esq.—Equitation, like all other arts has its principles, both in respect of the rider and the horse. They are well laid down and explained in this little treatise, which, however, we must say, seems to have been translated with dictionary in hand, and without any great knowledge of the original tongue. The following note by the translator, gives good reasons for taking the left, instead of, as is the custom, the right side of a lady on horseback:

When a gentleman accompanies a lady on horseback, he should take the left side of her horse. The custom of taking the right side is derived from the English mode of riding. The law of England directs the left hand of the road to be taken; the gentleman therefore takes the right, to protect the lady from vehicles, &c. which pass on that side. Here the law directs the right hand of the road to be taken, consequently the gentleman should take the left side of the lady's horse. It seems to be best adapted to afford efficient assistance, whatever may occur. The right hand of the gentleman is perfectly free, and may be used to stop the horse, or rescue the lady from danger. He can on this side aid her in disentangling her dress, disengaging her foot from the stirrup, adjusting her reins, and lifting her off her seat, without exposing her to the accidents which might occur to him, if he attempted to give her assistance from the other side. It is not so easy to

afford assistance to the lady with the left hand, nor is it so easy for the rider to command his own horse with the right hand.—*Rail Road Journal.*

LOVE OF MUSIC BY SHEEP.

WE were surrounded by a large flock of sheep which were leaving their fold to go to pasture; one of our party took his flute out of his pocket, and saying, 'I am going to turn Corydon, let us see whether the sheep will recognise their pastor,' began to play. The sheep and goats, which were following each other towards the mountain with their heads hanging down, raised them at the first sounds of the flute; and all, with a general and hasty movement, turned to the side from whence the agreeable noise proceeded. Gradually they flocked round the musician, and listened with motionless attention. He ceased playing; still the sheep did not stir. The shepherd with his staff obliged those nearest to him to move on. They obeyed; but no sooner did the fluter begin again to play, than his innocent auditors returned to him. The shepherd, out of patience, pelted them with clods of earth, but not one of them would move. The fluter played with additional skill; the shepherd exasperated, whistled, swore, and pelted the fleecy amateurs with stones. Such as were hit by them began to march, but others still refused to stir. At last the shepherd was obliged to entreat our Orpheus to cease his magical sounds. The sheep then moved off, but continued to stop at a distance as often as our friend resumed his instrument.—*Vie de Haydn par Bombat.*

BAYBERRY OR MYRTLE WAX.

THE Vegetable Wax, called Bayberry in the Northern, and Myrtle Wax in the Southern parts of the United States, is the produce of a shrub called by botanists *Myrica Cerifera*, which sometimes grows to the size of a small tree, and is found abundantly along the coast, from Maine in the North, to Texas, on the Gulf of Mexico. The wax is extracted from this shrub by collecting the berries, boiling them with water, and bruising them at the same time, by which the wax will rise to the top as a thick oily scum, easily separated, which, when cold, turns out a moderately hard substance, of a green dingy color. After chemical investigation, that substance has been found to resemble bees' wax so closely in the most important properties, that they may be classed under the same genus of chemical bodies.

Until now, the use of this wax has been very limited; the farmers pick up in swamps and the woods a sufficient quantity to supply themselves with candles; and if there is any surplus, they send it to market in New York, Boston, or other Northern places, where it is bought by candle makers, who mix it with their tallow, in order to correct, in summer, the extreme softness of their candles.

Notwithstanding the abundance of its growth, the picking up of the berries among swamps, thick wood and mire, is so laborious, that people who have attempted the collection of the wax as a special business and matter of trade, have found that one single bushel of berries is the utmost a stout and active man can collect in one day's work; hence its price in market is very high, fluctuating between 18 and 25 cents per pound.

The object of this publication is to invite the attention of farmers to the cultivation of the shrub affording the myrtle wax, in order to bring its price down to that of tallow. It is obvious that

should the shrubs be collected in one field, consequently ready at hand—it is obvious, I say, that the same man, who, under the difficulty of wandering in swamps, wood and mire, can collect but one bushel, shall be able, when he finds the shrubs gathered together in the same field, to pick up in the same space of time, from three to four bushels, can also deliver his wax at a price proportionably reduced; that is to say, from 25, to 8, 9, or 10 cents per pound.

The question now is, to investigate what will be the nett produce of an acre planted in myrtle wax, the wax selling at the reduced price of 10 cents per pound.

Let us suppose each shrub planted at two and a half feet from each other, there will be in one acre 6724 of them: supposing, next, the average product of each shrub to be only one pint of the berries—then the whole crop will amount to 6724 pints, making up 105 bushels. Now, experience has shown by those who follow the trade, that the quantity of wax obtained from a bushel of berries, averages from 5 to 8 pounds; then our 105 bushels of berries would yield 630 pounds of wax, which, at 10 cents a pound, tallow price, would make \$63.

As we have stated already, one man will pick up in a field from 3 to 4 bushels in one day, it follows that the picking of the whole 105 bushels, will require the labor of a hand during a whole month; admitting \$18 for the wages and finding—then \$18 deducted from \$63, the value of the crop as before stated, the balance, \$45, will be the nett profit accruing to the farmer.

Besides such a valuable income, this culture receives additional recommendations from the following circumstances:

1st. It grows in the worst soils, especially if damp and sandy.

2d. It requires no fences, as the cattle do not meddle with it.

3d. Once planted, it requires no attendance except in picking time.

4th. The picking may be performed by boys, girls, old men and old women, who else would be useless on the plantation.

5th. By a process discovered lately, the myrtle wax may be bleached to a degree of whiteness equal to that of bees' wax. This process adds only five cents per pound to the original price, is done in a short time, and within the power of every individual to perform.

6th. A soap equal, if not superior, to any shaving or fancy soap imported from Europe, can be manufactured of the myrtle wax.

A GOOD MINCED PIE FROM SAW-DUST.

DON'T be frightened!—A neighbor of mine once desirous of obtaining a steak from his store of beef found it very hard frozen, which rendered it difficult to cut. He therefore used a common hand saw, and sawed it on a clean cloth: his wife observed that she thought the meat thus made fine by the saw, might be the happiest mode of preparing it for a pie. She took it and added the other usual ingredients, and it made even a better and richer pie, than one made by boiling and chopping, &c. which trouble was saved. Sawing is clearly the easiest mode of obtaining a steak when the meat is frozen; the nutritive qualities of the meat lost in boiling are saved in this way, and of course the richer and better the pie.—*Maine Farmer.*

From the New-York Farmer.
PROGRESS OF CHEESE MAKING.

BY EPHRAIM PERKINS.

This article is submitted as a demonstration of what can be effected in our country, by community of exertion and enterprise, directed to one staple commodity; and also what extraordinary impulse has been given in a few years to one department of agriculture, in a small section, by the facilities of transportation on the Erie Canal. Heavy produce is transported from Utica to New-York for 25 cents per 100 lbs. on large contracts, this season.

Much public and general inquiry has, of late, been excited, by the rapid increase, extension, and improvement in cheese-making, in a district of about twenty miles in length, and ten or twelve in breadth, chiefly within, and parts of the towns of Salisbury, Norway, Fairfield, Newport, Russia, and Trenton—and of butter-making in the town of Steuben; being the second tier or range of towns on the north side of the Mohawk river, and within the counties of Herkimer and Oneida. A sparse population was spread over all these towns as early as the year 1800, and in 1815 had become a well-settled country, emigrating to the west; and at that period, and even till the completion of the Erie canal, cheese, as an article of commerce, over and above the home consumption, was an item little thought of or known.

It is supposed that less than 60 tons were annually exported from this district at that period, and this was chiefly confined in its manufacture to a few families in Norway. This district is hilly, well watered, and better adapted to grazing than to any other department of agriculture; and, without recourse to records, it is supposed that it may have doubled its population since 1815; and it is now ascertained that in 1832, though an unfavorable season for making, there was exported, the manufacture of this district, more than one thousand tons of cheese, besides twenty-five tons of pine-apple cheese. Mr. H. Burrell, of Salisbury, sold in New-York market near 400 tons of the same. In the art of cheese-making improvement has advanced in this district far towards what, in this age, is known of perfection, as will be acknowledged or attested by the extensive cheese merchants in New-York, Philadelphia, and the cities south.

Steuben, early settled by that noted Baron, is much inhabited by emigrants from Wales, and their descendants; has long been almost exclusively devoted to butter-making; and, although a small town, sent, in 1832, one hundred and fifty tons of butter to New-York market—which, as an article to keep good in tubs and firkins, stands high in market. Indeed, some small sections of the said cheese district make butter only.

The writer of this article was bred a farmer, and from the year 1806 to 1813 made a cheese dairy on the farm whereon he now lives, from twenty, and some years from thirty cows. Cheese was then a dull article, and he relinquished that business; and again, in 1828, commenced on a cheese dairy of forty cows, and now has, on the same farm, eighty cows. Inquiries are often made as to theory, and statistical facts, pertaining to this subject, from friends and acquaintances, both near and remote, and he has been requested to communicate in writing the modern process of making, as practised by himself and many others, at this day, and also to point out as distinctly as might

be, the difference between the former and the latter process. This has been done, by saying that less heat, and some less salt, is applied in the making, and the cheese made softer, and is kept from spreading and cracking, by swathing, soon after the cheese comes from the press. The milk, in warm weather, is not considerably below the warmth of milk directly from the cow. The rennet must be free of taint, and made in such quantity as to last several weeks, that its power can be relied upon to "fetch the cheese," in three quarters of an hour, or be sure in an hour, so as to "break up," which is done with the hands, from bottom to top of the tub or vat, or with an utensil made of fine brass wire, with a sharp iron or brass rim, in squares of three quarters of an inch, like a sieve, with two high bales crossing each other on the top, and reaching above the top of the tub; when broken up, it is then left for a little time, till the curd settles, and the whey rises on the top; then begin to draw or dip off, and of the first put some over the fire, and with it, as soon as may be, gradually increase the warmth in the tub, working off the whey and making fine the curd, endeavoring always so to manage that the whey is as green as possible. It is a conceded fact, that the greener the whey the richer the cheese. If the weather be hot, and there be any appearance of souring in the tub, the process must be hurried, and less heat applied, or the cheese will be hard and dry, and the yield small in proportion. For the last half-hour, we have, in warm weather, about milk or animal heat in the tub or vat, and this is called the scalding process, which, if all works well, is done in about two hours from the setting, and ready to dip off into the cheese basket or cinque. It has, I believe, been a general practice to cool off the curd while in the tub, with cool whey or water, or the cheese will be rank, but we do not so; we let the cheese go to the press with its warmth, except what is imparted by making it fine and stirring in the salt, and think it closes better, and needs much less scalding, and is not so liable to be porous and spongy. We put two pounds of dry Onondaga salt to 100 lbs. of curd, pressed and worked so fine and dry that not more than two quarts of whey can be extracted by the press. We choose to have our cheese made so soft as to need swathing the first or second day; and if the weather be very hot, very soon after they come from the press. This is done with cheap cotton cloth, stained with annatto, and dipped in melted lard, and, by some cased entirely over, there to remain till the cheese goes to market; it is then safe from flies to keep any length of time, if made so as not to leak.

The soft cheese ripens and matures much sooner than the dry hard cheese; the latter will dry much sooner; but maturing and drying are, or may be, very different. Cheese will shrink two to one in October that it will in August, yet it will ripen and mature three to one in August that it will in October and November.

Many suppose that large cheeses require more time to ripen than small ones, but we think not; the ripening process is of a chemical nature, rather accelerated by increased mass than retarded; as is also the mass of the baker, the brewer, and the distiller, by increased mass.

A very little cheese, made to please a child, will soon become dry, but never have maturity or taste. The coloring, if any, should be of annatto, dissolved in pure strong ley, a spoonful or two of

which is sufficient for the milk of a large cheese; let the outside be painted with the same soon after the cheese comes from the press, then dry an hour, and be anointed with lard or butter. We do not darken the room, or attempt to keep out the flies, but depend on the soundness of the cheese to save it from their depredations. In hot weather we open our doors and windows, and give air, but cool dry winds, blowing directly on, will crack the cheese. In spring and fall we keep up a generous warmth; and indeed, in the cool damp days in midsummer, have fire in the cheese room stove, and so greatly accelerate the maturing process.

My sons commenced cheese-making the present year the 15th of April, and before August had three tons of cheese in market, which would have passed well with many for old cheese, being so ripened. It is found, by actual experiment, that every pound of butter taken from a cheese will shrink the weight of the same about three pounds for one. The experiment of making cheese of milk directly from the cow night and morning has been tried often in this section, but I know of no one who continues the practice. The yield will be greater, but the cheese rank, carrying into it something of that kind of taste peculiar to milk directly from the cow.

The reservoir for the whey, and every other thing that may have tendency to charge the atmosphere with impurity, should be kept at a sufficient distance; and the room where the milk stands over night, well ventilated.

The question is often asked, how much cheese will each fair dairy cow make in a season? and how much in a day will each such cow make at full grass in May? I answer, 300 lbs. is perhaps about an average yield for a fair dairy well kept; but a very choice selection of cows well kept will sometimes exceed 400 lbs. in a season, and one such cow may make four or five pounds in a day at full grass. We have very few cows of the improved breeds, and very little stock is raised. Many hundreds of cows are brought in annually from a distance, for sale and for use.

EPHRAIM PERKINS,

One of the Com. of the New-York State
 Agricultural Society for Oneida Co.

South Trenton, August, 1833.

"Living within the above cheese district, I am well convinced that the calculations here made by Ephraim Perkins, Esq. as to the quantity of cheese manufactured in second district, is to be relied on as correct; and his process of making worthy of the attention of those engaged in the dairy business.

W. WILLOUGHBY, M. D.

Late President of the Agricultural Society
 of Herkimer County."

FARM HORSES FED ON STEEPED BARLEY.

THE barley is steeped 48 hours in a close wrought wicker basket, fixed into a cask of water, for the convenience of draining it when taken out. It is then laid on the floor to sprout, where it requires some little care. The kernels should be examined by opening them; and if the nib of the sprout is half way up, it is then ready to use; if suffered to grow through the kernel, then the saccharine matter will be exhausted, and the nutritious part lost. No more should be steeped at one time than is used at this state of vegetation.—*Gardener's Magazine.*

LAWS

WHICH AUTHORISE TRAFFIC IN ARDENT SPIRIT AS A DRINK MORALLY WRONG.

THE American Temperance Society, at the commencement, took the ground that to drink ardent spirit is *morally wrong*; and in their Reports they have exhibited the reasons which demonstrate its truth. Millions in this country have embraced this truth, and are now acting under its influence. Its influence has also been extended to other countries, and great numbers in foreign lands are imitating our example.

The next position taken by the Society, was, that it is wicked to make ardent spirit, or to furnish it to be drunk by others. This too they accompanied by legitimate and abundant proof; and it has been embraced; as whole counties in which it is now a violation even of human law to sell it, and of a thousand churches in which there is not a man who prosecutes the business, and thousands of other churches that are struggling to throw off the mighty incubus, abundantly testify. It is shown also by the existence of more than six thousand Temperance Societies, embracing more than a million of members; pledged to abstain from the drinking of ardent spirit, and from the traffic in it, and also to use all suitable means to cause this to become universal. The means by which such a result may be expected, is the universal conviction that the drinking of ardent spirit, or the furnishing it to be drunk by others, is *sin*; an offence against God, and injurious to the temporal and eternal interests of men. Whatever tends to produce this conviction tends to promote the Temperance Reformation; and whatever tends to prevent the one, tends to hinder the other. Perhaps nothing now stands more in the way of producing this conviction, and causing it to become universal, than the fact, that the traffic in ardent spirit is authorized by law; and thus receives the sanction and support of legislation. This is a public testimony to the world that the sale of ardent spirit, and of course the drinking of it, are right; a fundamental and fatal error, destructive in its effects to the life that now is, and to that which is to come. The next thing to be accomplished therefore, is, by the universal diffusion of information and the exertion of kind moral influence, to produce throughout the community the conviction, that the laws which authorise the traffic in ardent spirit as a drink, by licensing men to pursue it, are *morally wrong*; opposed in their influence to the laws of God; and that the public good, instead of requiring that some men should sell ardent spirit, utterly forbids that this should be done by any; and that no men or body of men who understand, or have the means of understanding this subject, can be instrumental in making such laws without the commission of sin. And as such laws are *morally wrong*, they never can be politically right, or beneficial, or expedient. While Jehovah lives, righteousness, and that alone will exalt a nation; *sin* in any form, and especially if sanctioned by law, will be a reproach and a nuisance to any people. That this is plainly and strongly the case with the traffic in ardent spirit, and that the laws which authorise it are *morally wrong*, and in their influence opposed to the will of God, is manifest from the following considerations, viz:

I. Ardent spirit is a poison, and the drinking of it is not useful or beneficial to men. Even the moderate use of it is positively hurtful; and is a violation of the laws of health and of life. Of

course no man has a *natural* right to furnish it; or to wish for laws which shall authorise him to do it. And no man acquainted with the subject can be instrumental in making laws which shall authorise others to do it, even in a savage state, without guilt. Such laws would legalize sin, and violate the law of God.

II. No man acquires a right to make such laws by entering into society; and no body of men by the establishment of civil government. The only legitimate object of government is to protect, and to benefit the community. It has no right, any more than individuals, to injure that community; or to pass laws which authorise others to do it. And if it does, it violates the divine will; and the individuals who compose it, will, at the divine tribunal, and ought at the bar of public opinion, to be held responsible for the effects. The personal responsibility of each individual for the influence which he exerts, is in no case merged in the general mass; or swallowed up and lost in the responsibility of the body. Each one is bound by obligations which he can never throw off, in whatever situation or capacity he may act, to honor God, and do the greatest good of which he is capable to mankind. In no case has he a right to injure others or be instrumental in making laws which will authorise them to do it. It would be having a right to do wrong, which carries on its face evidence of falsehood.

III. The authorising of men by law to traffic in ardent spirit as a drink, is inconsistent with the temperance of the community. Temperance is the moderate and proper use of things beneficial, and it is abstinence from things hurtful. Ardent spirit being one of the hurtful things, temperance with regard to this, is abstinence—perpetual, entire, universal abstinence. But by authorising men to sell it, and professing to do this for the public good, legislators declare that to buy and drink it is right, and useful. This is not only false, but promotes intemperance. To use a thing which is in its nature hurtful is intemperance, no less really than to use a beneficial thing to excess; and is often more injurious; especially when the use of it, as in the case of ardent spirit, even in small quantities, tends to a constant increase. To teach the doctrine then by legislation, that it is right to drink it, in any quantity, is to promote intemperance; to inculcate a doctrine which tends to form intemperate appetites, and which lies at the foundation of a great portion of all the drunkenness in the world. It does immense injury in another way, by increasing the difficulty of convincing men that to drink ardent spirit, or to furnish it to be drunk by others, is *sin*. Many see no difference between what is legal, and what is right. With them, the standard of right and wrong is human law. If a thing is legal and they wish to do it they take it for granted that it is right. Show that it dishonors God, and destroys men, and is therefore wrong, they meet you with the fact that it is legal, and therefore conclude that it is right; and thus they ward off the conviction, which they would otherwise feel, of its enormous wickedness and guilt. They tell you that it is allowed by law; that they have gotten a license and paid for it; that this is a land of liberty; and begin to clamor about their rights to increase the taxes, demoralize the character, destroy the health, shorten the lives, and ruin the souls of men; or else, which is more common, contend in opposition to

facts that their business does not do this. "If it did," say they, "legislators would not license it. They know what is right, and as they have made laws, authorizing it, and as they expressly say, for the public good, it is right, legally, and *morally* right for us to continue to sell it,—all its consequences," which they acknowledge are tremendous, "and all that temperance people say to the contrary notwithstanding." This, were legislators right in authorising the traffic, would be true; and it would present a barrier to the triumph of Temperance, which would be absolutely and forever impregnable; and it would roll the burning current of desolation and death over man to all future generations. And the fact that legislators, as well as rum-sellers and rum-drinkers act as if it were right, and as if the public good required that some men should continue the traffic, presents one of the greatest obstacles to the progress of the Temperance Reform. It prevents in the minds of thousands, the conviction of the demoralizing character, the deadly effects, the enormous injustice, the gross oppression, the high handed immorality, and the tremendous guilt of that desolating traffic. Were it not for the ramparts which legislation has thrown around it, the pressure of public indignation, as light and virtue increase, and facts are developed, would sweep it away; or sink it into the abyss from which its fires, smoke, and stench, would no more escape to annoy and desolate the earth.—[To be continued.

From the Genesee Farmer.

VEGETATION.

THE celebrated Dr. John Mason Good, when writing on the different stimulants contained in the atmosphere which are beneficial to vegetation, says, "Ammonia is a good stimulus, but oxygen possesses far superior powers, and hence without some portion of oxygen few plants can ever be made to germinate. Hence, too, the use of cow dung and other animal recrement, which consist of muriatic acid and ammonia; while in fat, oil, and other fluids, that contain little or no oxygen, and consist altogether, or nearly so, of hydrogen and carbon, seeds may be confined for ages without exhibiting any germination whatever. And hence, again, and the fact deserves to be extensively known, however torpid a seed may be, and destitute of all power to vegetate in any other substance, if steeped in a diluted solution of oxygenated muriatic acid, at a temperature of about 46 deg. or 48 deg. of Fahrenheit, provided it still possess its principle of vitality, it will germinate in a few hours. And if, after this, it be planted as it ought to be, in its appropriate soil, it will grow with as much speed and vigor as if it had evinced no torpitude whatever."

In the latter part of 1826, I received several packets of seeds which had come from the Cape of Good Hope and New South Wales, with part of which I made several efforts on various plans to cause their vegetation, but I was invariably unsuccessful. The residue by chance were put in my trunks, and there remained until the fall of 1828, when I first read Dr. Good's method. I immediately made the experiment, and with the greater part I was perfectly successful.

ALEXANDER GORDON.

Mr. B. Nason of this town, raised the present season, 81½ bushels of Oats per acre—3 acres in the piece.—*The Age, Augusta, Me.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 30, 1833.

TOASTS

DRANK AT THE BRIGHTON CATTLE SHOW.

WE were able to obtain but a few of the sentiments, which were elicited by the festivity of this occasion, but we are sure that their quality will amply atone for any deficiency in quantity. Other wise and witty sayings were uttered and applauded, but like many brilliant things, were (so far as our memory is concerned) as evanescent as the scintillations of the Aurora Borealis.

The United States of America—Their strength, prosperity and glory, lie in their union.

The Commonwealth of Massachusetts—May she ever remain true to her own interests, true to her own character, and true to the whole country.

The Governor of the Commonwealth—Nine years of social and political prosperity under his administration, are the best proof of his wisdom and patriotism.

The late President of this Society, Mr. Lowell—a farmer both practical and scientific; a benefactor to this Society, whose services are never to be forgotten.

The Twenty-four States—A team strong enough for any work, provided they do not break the chain.

In proposing a toast, Mr. Welles observed, that it might be thought proper he should report to the Society thus assembled, that he had represented them at the Worcester agricultural Show—and the Massachusetts Agricultural Society had been noticed in that gracious manner so customary and so complimentary by the president of that society, to which he had the honor to respond.

In the Exhibitions of the Day there was much to admire, and it seemed difficult to conjecture where the fertility of production in that beautiful county might pause. The president of that society had exhibited an apple which he now made room for in his carriage, and had brought to Brighton; this he invited the company to view [the apple here raised] and in reference to which he asked leave to propose the following toast:

The Orator of the Day—He engrafts the scion of public usefulness on the stock of private worth.

After some pertinent remarks the Governor expressed a compliment to the Orator, and toasts with pleasant and appropriate introductions were offered by Mr. Everett, Judge Story, and Mr. Webster.

The removal of the deposits from the barn yard to the field—a constitutional measure for the benefit of the local banks.

The Speaker of the day—Old Virgil may have spoken well of agriculture in poetry—we are satisfied with its praises in prose.

By the President—*M. Emanuel Fellenburg* of Switzerland, an Honorary member of this Society—alike celebrated for his great practical skill in husbandry, as for the important and valuable instruction in his favorite pursuit, constantly and gratuitously imparted to the young men in his vicinity.

By Mr. B. V. French—*The Rev. Farmer at Meadowbank*; the Arthur Young of America; his theory and practice promise for New England what the Rev. Author's did for old England—may the happy influence of his example and industry prevail.

Hon. HENRY CLAY was admitted an Honorary Member of the Massachusetts Horticultural Society at their last meeting.

Enormous Beet. Mr. George Newball of Dorchester has raised this season a SUGAR BEET, which exceeds, so far as our observation has extended, all of its kind that was ever yeilded a Mammoth Vegetable. It weighs without the top 23 lbs! It was presented on Saturday last to the *Mass. Hor. Soc.* and may now be seen at the office of the N. E. Farmer.

New kind of Corn. The same gentleman, mentioned above, has imported from the South, and left at the N. E. Farmer office an ear of corn, of a singular and to us non-descript kind, in which every kernel has a separate glume or envelope like the chaff of wheat. The specimen left with us is not ripe, being planted late, but it is thought that it will prove valuable as food for cattle.

Prodigious Turnip. A Turnip was raised the present season, by Mr. George Latimer, of Hartford, Vt. which weighs 16½ lbs. and its circumference is 38½ inches. It may be seen at the office of the N. E. Farmer.

ROLLING WHEAT GROUND.

FARMERS are often heard mourning the effects of winter in injuring their wheat fields. The great and sudden changes of temperature throw the roots out of the ground, and thus kill the plant. Rolling the ground after the wheat is sown has a very great tendency to prevent injury from frost and thaws. Next harvest, many a one, we dare say, will lament that he did not get and use a roller.—*New York Farmer.*

AMERICAN INSTITUTE.

THE following are among the Premiums awarded by the American Institute at its Annual Fair, October, 1833.—

To the Great Falls Manufacturing Company, Somersworth, N. H. for the second best blue and black Broadcloths—a premium.

To the Middlesex Manufacturing Co. Lowell, Mass. for the best piece of Cassimere, (drab and printed)—a Silver Medal.

To the York Manufacturing Co. Saco, Maine, first premium for bleached and brown Canton Flannels—a Silver Medal.

To Robinson, Jones & Co. Attleborough, Mass. for the best specimen of Military, Naval and Sporting Buttons, and for the truth and finish of plain flat Buttons—a Silver Medal.

To J. M. L. & W. H. Scovill, Waterbury, Con. for the second best Silver Plated Metal—a Silver Medal.

To Oliver Ames, Easton, Mass. for the best Spades and Shovels—a Silver Medal.

To Daniel Adams, Springfield, Mass. for the best Sand paper—a premium.

To Allen & Co. Boston, and Wm. Minns, New York, for the second best Account Books—a premium.

To Oliver Perkins, Maine, for a Press, upon the principle of the inclined plane, very powerful, and requiring but small power—a premium.

To P. Hubbard, Vermont, for a Rotary Hand Pump, simple, powerful and lasting—a premium.

To the Boston Crown Glass Company, for well made articles of excellent quality—a premium.

To Day, Venables & Taylor, Norwalk, Con. for good articles of Flint Stone Ware—a premium.

ITEMS OF INTELLIGENCE.

An experiment was made some time since on the Dansville and Pottsville railroad, over the inclined plane, in order to ascertain its practical operation. The plane is 800 feet in length, and 200 feet in perpendicular height. The car, which was drawn by a descending one, passed up in 90 seconds, and without the least interruption to its smooth progress. Water power, it is said, will be used on these inclined planes, being at present attended with far less expense than that of steam machinery.

The *Omnibus* spirit has extended itself to Charleston, S. C. We observe by a recent number of the Courier, that an Omnibus has commenced running at certain hours of the day to various designated points.

A letter from Oxford, Chenango County, New York, states that the quantity of butter was fully one eighth to one quarter greater than ever was known, and that the farmers have bountiful crops of every thing except corn. Letters in fact from every part of the State of New York, concur in the statement, that for years the crops have not been equal to those of this season.

The Horticultural Garden of Mrs. Parmentier, on the Jamaica turnpike, two and a quarter miles from Brooklyn Ferry, was sold on Friday, for the sum of \$57,000. The garden comprised twenty-four acres, and has been purchased by a company, for the purpose of converting it into building lots.

Law for Travellers.—A court in Cincinnati recently decided that it is the duty of stage proprietors, to provide good and sound carriages, horses, and harness, a skilful driver, and not to take more than a reasonable load. Should they travel in the night, it is their duty to carry lights. In cases of accidents, occasioned by a fault in any of these particulars, the proprietors are liable.

During the late exhibition of manufactures by the Franklin Institute, in Philadelphia, there were \$1,400 collected; and about 40,000 persons as spectators.

A letter from Hartford says, that a piece of one of the boilers of the boat New England, was found at a distance of two miles from the scene of the explosion.

There is scarcely a greater degree of mortality, on record, as occurring in one family, than that mentioned as having recently taken place in the family of Daniel Bamby, of Berks County, Pa. From the 28th of August to the 22d of September, no less than seven members of this family, including its head, were carried off. A general want of cleanliness, and a cellar filled with stagnant water, are said to have been the probable cause of this unusual fatality, in one household.

A friend who has had an opportunity of noticing the rain gauge at the Hospital, mentioned to us that between the 7th inst. and yesterday at 9 o'clock A. M., there had fallen ten inches of water in rain. This is the greatest quantity of water ever known to have fallen in this country, in the space of time. The average quantity of rain falling annually for the last twenty-three years, is about thirty-six inches.—*U. S. (Philadelphia) Gazette.*

The Charleston Patriot says, it is understood that the Bank of South Carolina has refused to receive the United States deposits.

Gale on Lake Erie.—A severe gale was experienced there on the 17th inst., by which a large number of vessels on the Lake were driven ashore—roofs swept off of buildings, and chimneys blown down, and other damage done.

Great Fire.—An extensive conflagration took place in Somerset, (Penn.), on the morning of the 16th. At half past two a fire was discovered in the house owned by J. F. Cox, Esq., and occupied by several families, and

by several mechanics. In a few moments it spread both east and west, and its progress was not sensibly arrested, until every house between the street which crosses Main street at Judge Krutz's and Main Cross street, were entirely consumed. Upwards of thirty families are turned homeless into the streets. The part of the town which is now in ashes, was the most business doing and populous, as well as most valuable; stores, offices, shops, taverns—all have been consumed. We suppose the whole loss not less than one hundred thousand dollars!

—*Somerset paper.*

FRUIT AND FOREST TREES, &c.

BLOODGOOD & CO. have for Sale at their Nursery at *Flushing, L. I.* near New York, a large assortment of the most approved American and European sorts of Apple, Pear, Peach, Cherry, Plum, Apricot, Nectarine and Quince Trees, hardy Ornamental Trees, flowering Shrubs and Plants, of almost every description usually kept in Nurseries. Of the *Pear Trees* they have a large stock and of good growth, amongst which are most of the celebrated new sorts. About eight thousand of the *Morus Multicaulis* Mulberry Trees, so much esteemed for the feed of the Silkworm, which they will sell at Twenty-five Dollars per hundred. To Nurserymen who want to increase their stock or to sell again, liberal discount is made, excepting on the *Morus Multicaulis*. The *Fruit Trees* in this Establishment are all grafted or inoculated by the Proprietors, who feel confident in their being correct. Orders forwarded by mail to **THOMAS BLOODGOOD, No. 208 Front Street, New York**, or to **BLOODGOOD & Co. Flushing, L. I.** will be particularly attended to. Catalogues may be had of **Geo. C. Barrett, at the Agricultural Warehouse, No. 52 North Market Street.** 31 o 16

WM. PRINCE & SONS,

—Deeming it unnecessary to have any Agent, request all orders to be sent to them *direct per mail*, and they will receive prompt attention, and be forwarded precisely as desired. Catalogues will be sent gratis to every applicant.

N. B. *Morus Multicaulis*, or Chinese Mulberry, \$25 per 100, and \$4 1-2 per dozen.

Linnæan Botanic Garden and Nurseries,
Flushing, Oct. 8th, 1833. o 23

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of *new celebrated Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus Multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of **ROSES**. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Pæonies*, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to **WILLIAM KENRICK, NEWTON.** Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with **Geo. C. BARRETT**, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

TREES, SEEDS, PLANTS, &c.

THE Subscriber having been regularly bred to the business of Horticulture, &c. in England, and having resided in, and visited different parts of the U. States—considers himself fully qualified to select any thing in the line—as he has business that will call him to England the first of November, he will undertake to select and see personally to packing and shipping to any part of the U. States any thing that may be requested in his line for a small commission. The most respectable references given as to character and capacity. Please address communications to the care of **Messrs. G. THORNBURN & Sons** previous to Nov. 1.

JOSEPH LODGE.

oct 2

VALUABLE FARM AT AUCTION OR PRIVATE SALE.

THE Subscriber offers for sale a Farm situated in the town of Marlboro', Mass. about half way between Howes' Tavern and the Lower Meeting-House. It consists of 140 acres of excellent land, with a large two-story Dwelling House, two Barns, Chaise and other Out-houses, with two fine Wells of Water. About 70 acres of the land is covered with a fine growth of the best quality of Wood; the remainder consisting of Mowing Lands, Tillage and Orchard, in a high state of cultivation. It now supports 20 head of horned cattle, horses, swine, &c.

For the last 25 years, this estate has been improved by Mr. William Wilson, deceased, and for 50 years previous thereto, it was known as "Munroe's Tavern." The excellent quality of its soil, the large and valuable quantity of wood, and its other numerous advantages, make it a most desirable situation for a farmer; while its situation (on the old road to Worcester, on which the travel is great, the distance from any other tavern and its former notoriety as one), makes it a no less desirable situation for a Tavern again.

The above estate, free from all incumbrances whatever, will be sold on Friday the first day of November, unless previously disposed of by private sale. As also, at the same time, all the cattle, a large quantity of hay and grain, farming utensils, &c. as are not previously disposed of.

Terms of purchase made known on the day of sale. Likewise, several other lots of land belonging to the same estate, will be sold at the same time.

JOSIAH WILSON, Administrator.

For further information, apply to **WEBBER WILSON**, on the premises, or to **Messrs. LOT WHEELWRIGHT & SON, No. 46 Central Wharf.** sept 11

COUNTRY SEAT AT AUCTION.

To be sold at Auction, on Wednesday, November 6, at 11 o'clock, on the premises, (unless previously disposed of at private sale) the estate of the subscriber, situated in upper Beverly, called Cherry Hill, four miles from Salem, and about seventeen from the city of Boston, consisting of 200 acres of tillage and pasture land in good condition, with the dwelling-house, barns, out houses, and other buildings thereon situated, including several lots of wood land, peat meadow, &c. The view from the dwelling-house is extensive and commanding, and embraces, beside the towns for many miles in the interior, the whole of Massachusetts Bay, from the Light House on Baker's Island, to Nahant and the islands adjacent. The fruit trees are numerous and of great variety, having been selected with much care and attention, for the last thirty-five years. The property is a desirable one for farming purposes, or as a pleasant and convenient country residence.

At the same time, will be sold the live stock, farming utensils, and produce; consisting of oxen, cows, horses, wagons, carts, ploughs, potatoes, corn, hay, &c.

Also, a Pew in the Meeting-house. Enquire of **Mr. WM. NUTTER**, on the premises, or of **STEPHEN WHITE, No. 7 Somerset Street, Boston.** oct 23.

COWS, FARMING, AND GARDEN UTENSILS, &c. AT AUCTION.

The subscriber will sell at Auction, at his place in Dorchester, at 1 o'clock, P. M. on Thursday, the 31st inst.—6 first rate COWS, 3 of them will come in in December.

1 Horse Cart, 1 Horse Wagon, for marketing, 1 Milk Cart, (new last spring) 1 Hay rigging, 1 Small Wagon, with canvas top, 1 Harrow, 2 Ploughs, &c. 1 Booby Hack, for one or two horses. 1 Sleigh, Harnesses, Saddle, Bridles, Whips, &c.

Also, a variety of Farming and Garden utensils, which are too numerous to mention. From 12 to 15 tons of English Hay, a few tons of Mangel Wurtzel, which is very good for stock.

Also, a few bushels of Potatoes and other vegetables. The sale will be positive, as the place was sold on the 2d of September last.

JOHN SWETT.
EBENEZER EATON, Auctioneer.
Oct. 23, 1833. 2w

NEW ENGLAND FARMER ALMANAC FOR 1834.

JUST published and for sale by **Geo. C. Barrett, No. 52 North Market street.** The New England Farmer's Almanac, for 1834, by **T. G. Fessenden**, editor of the N. E. Farmer.—Astronomical calculation by **R. T. Paine, Esq.** Dealers supplied on liberal terms. oct 9

BUCKTHORNS.

Buckthorns for Hedges for sale at \$3 per 100 for large ones, and small thorns in proportion, by **G. C. BARRETT.**
N. B. These are the genuine thorns, raised upon the farm of **E. H. Derby, Esq.** o 23

WINTER BARLEY.

A few bushels of this valuable grain for sale at this office. The great advantage of this grain is, it enables the farmer to lay down his land in the autumn, when he is not so much hurried, and when the land is generally in a better state for leaving it smooth, than in the spring. This has been successfully raised for the last four years in the eastern part of this State, and stands the winter admirably. 2w o 23

BRIGHTON MARKET.—MONDAY, OCT. 28, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 4540 Beef Cattle, 125 Stores, 4670 Sheep, and 575 Swine.

PRICES. *Beef Cattle*.—Sales were remarkably brisk, and business was very lively through the day, save a few moments when the attention was drawn another way by the appearance of the distinguished visitor from the West, who was about the yards—we saw him handle some of our best cattle. A few very fine were taken at \$5 25, and 5 50. We quote prime at 4 75 and \$5; good at \$4 25 a 4 50.

Barrelling Cattle.—Our quotations last week appear to have been substantiated, viz. mess \$4 a 4 12; No. 1, 3 50 a 3 62; No. 2, 3 a 3 25.

Stores.—Very few sales noticed. *Sheep*.—We noticed sales at \$1 42, 1 58, 1 67, 1 75, 1 88, 2 12, and 2 33. *Wethers* 2 25, 2 50 a 3 and 3 50; some very fine at 5 and \$6.

Swine.—A lot of old Swine, Sows and Barrows, were taken at 4, 5-16; a lot of Shoats, selected at 5 1-4 for Barrows, and 4 1-4 for Sows, one lot, 4 for Sows, and 5 for Barrows. At retail, 4 1-2 a 5 for Sows, 5 1-2 a 6 for Barrows.

MISCELLANY.

*For the New England Farmer.***THE CRUSADERS AT THE HOLY SEPULCHRE.**

THEY knelt beside the battle plain,
Beneath a burning sun—
And number'd o'er their country's slain,
And ev'ry victory won.
And many a heart beat high that hour,
With feelings proud and stern,
Though worship brought no priestly power,
Nor censer there to burn.

They knelt beside the Saviour's grave
In deep and solemn prayer,
No banner-folds above to wave,
Nor spear nor shield were there.
The chieftain came—no herald's blast
Proclaim'd his princely name—
No minstrel of the glorious past
To greet his knightly fame.

The peasant, with his gleaming spear
Along the crested line—
Whose war-shout rang both loud and clear—
On! for the sacred shrine!
He had but bravely struggled on
For many a bloody day,
That he, when field and fame were won,
His tribute there might pay.

They woo'd a proud, a lofty fame,
Those way-worn, aged men—
Who onward through old Europe came,
And through the Paynim's glen.
For there, as in their native land,
They counted death no loss—
So they but near His grave could stand—
First soldier of the Cross.

And woman in her hour of bloom,
From sunny hills afar—
With flowers to wreath her Saviour's tomb,
Cross'd many a field of war.
No cloud upon her vision came,
No dream of earthly woe—
She cherish'd there that holy flame
Which triumph'd o'er the foe.

The priest forgot the mitred dome—
High words of burial rite—
He left afar a smiling home,
To fight the Christian's fight.
He rested where the fountain gush'd,
And palm and cedar wave—
The thrilling call had there been hush'd
Beside that humble grave.

That grave! That grave! Would I could stand
Where stood that mighty host—
On that redeem'd and glorious land,
To them forever last—
And hear again the shout that rang
Along those hills of thine,
When leagued Crusaders came to free
The shores of Palestine.

Weston, Oct. 19, 1833.

SONG OF THE BEES.

WE watch for the light of the morn to break,
And color the Eastern sky
With its blended hues of saffron and lake,
Then say to each other, "Awake! awake!
For our winter's honey is all to make,
And our bread for a long supply."

And off we hie to the hill and dell,
To the field, to the meadow and bower,
We love in Columbine's horn to dwell,
To dip in the lily with snow white bell,
To search the balm in its odoriferous cell,
The mint and the rosemary flower.

We seek the bloom of the eglantine,
Of the painted thistle and brier.
And follow the steps of the wandering vine,
Whether it trail on the earth supine,
Or round the aspiring tree top twine
And reach for a state still higher.

While each on the good of his sisters bent
Is busy, and cares for all,
We hope for an evening with heart's content,
For the winter of life; without lament
That summer is gone, its hours misspent,
And the harvest past recal.

WONDERS OF PHILOSOPHY.

THE polypus receives new life from the knife which is lifted to destroy it. The fly-spider lays an egg as large as itself. There are 4041 muscles in a caterpillar. Hook discovered 14000 mirrors in the eyes of a drone; and to effect the respiration of a carp, 13,300 arteries, vessels, veins, and bones, &c. are necessary. The body of every spider contains four little masses pierced with a multitude of imperceptible holes, each hole permitting the passage of a single thread; all the threads, to the amount of 1000 to each mass, join together when they come out, and make the single thread with which the spider spins its web; so that what we call a spider's thread consists of more than a 1000 united. Lewenhoeck, by means of microscopes, observed spiders no bigger than a grain of sand, which spun threads so fine that it took 4000 of them to equal in magnitude a single hair.

NIAGARA WHIRLPOOL.

THIS whirlpool, which is several miles below the Falls at Niagara, is a large deep basin, about the size of Primrose Hill, at the back of Chalk Farm, in which the waters of the mighty St. Lawrence revolve in one perpetual whirl, caused by their being obstructed by an angle of the steep and dreary banks which overhang this dreadful place. Mr. Wallace, the blacksmith, had a son, a fine youth, who one day went down to the whirlpool, and the current proving too strong for him, he was carried into the whirl. His poor distracted mother sat on the gloomy bank for hours and days, and beheld the body of her own darling carried round in a circle by the water, sometimes disappearing for a time and then coming up and revolving upon the surface of his watery grave, and thus continuing for several days, no human aid being available even to obtain his remains. After five or six days, bodies which get into this dismal cauldron are carried down the river. It is usual for persons rafting timber from places between the Falls and the Whirlpool, to get off the raft before they come to the basin, first placing the raft in such a position as may best enable it to float down the stream without being carried into the whirl. On one occasion, however, one of the raftsmen refused to leave the raft—he was not afraid, all would go safe; entreaty was unavailing, and the raft with the unfortunate headstrong man upon it, made its way downwards, and was soon drawn within the fatal circle, around which for three days and three nights it continued to revolve, all the efforts of a thousand anxious spectators proving unavailing. The continual and sickening motion he underwent, robbed the poor sufferer of all power to eat—sleep he could not—a dreadful death was before his eyes, so much the more terrible that it was protracted night after night in

such a place. At last a man was found who ventured into the whirl as far as he could, with the hopes of life, a strong rope being tied round his middle, one end of which was on shore. He carried a line to throw to the raft—succeeded; the agonized sufferer fastened it to the raft, and in this way he was drawn on shore, and his life preserved.—*Mackenzie's Sketches of the United States.*

The Falls of Girsbury, on the western coast of the Madras territories, are of the unparalleled depth of 192 feet—as far as history or travels have informed us, the highest falls in the known world.

EPITAPH ON A MISER.

Here, crumbling lies, beneath this mould,
A man, whose sole delight was gold;
Contentment never was his guest,
Though thrice ten thousand filled his chest;
For he, poor man, with all his store,
Died in great want—the want of more!

NEW ENGLAND SEED STORE, AND HORTICULTURAL REPOSITORY.

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS, upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

POTATO BLOSSOMS.

MR. FESSENDEN—Sir, In the 5th vol. page 373 of the N. E. Farmer, you notice the statement of a writer in the Farmer's Magazine, a British publication, who among several other fine things, asserts "that in the drills where the flowers (meaning the potato blossoms) were gathered as soon as they appeared the crop was doubled, to what it was where the apples were allowed to come to maturity." You published this statement in 1827. I believe it had been previously published by Mr. Knight, that plucking off the potato blossoms would greatly increase the crop.

The present season I tried the experiment; and I will now give you the result.

I planted twelve rows of the Chenango potatoes all in drills of exactly sixty five feet in length. Without any preference I drove a stake at the head of one of the rows, and from that row I carefully cropped the blossoms from day to day as they appeared. Last week I dug them, and from the row from which I plucked every blossom, I gathered 330 large, handsome Chenangoes fit for steamer—also 146 small ones fit only for my cow. One adjoining row from which no blossoms were taken produced 354, equally large and fit for the steamer, together with 129 small ones. The other adjoining row, from which no blossoms had been taken, produced 366 equally large and fine, together with only 92 small ones. So that my land, with exactly the same cultivation I have no doubt produced at least 8 per cent. more potatoes, reckoning large and small, by leaving nature to herself. I pray you, sir, to recommend the same experiment to be tried by others, the next year, with different sorts of potatoes.

INQUIRER.

Charlestown, Oct. 25th.

From the New York Farmer.

SALTPETRE.

It is with no small degree of surprise that I observe in your paper a communication from Prof. Rafinesque, in which the use of Saltpetre, for the purpose of preserving meat, is condemned in the strongest terms. A communication from such a source will be received by a great mass of the community as fact, without inquiring whether it be so or not; and as the article in question is most palpably erroneous, I feel it to be due to the public that its errors should be exposed. In the first place it is stated that "the part of saltpetre absorbed by the meat is nitric acid or aquafortis, a deadly poison," than which nothing can be more erroneous. If Prof. R. can decompose nitrate of potassa (saltpetre or nitre) by means of animal muscle, he has gone one step further in chemistry than any other person. On the same principle may we say that common salt is decomposed, and that the part which enters the meat is muriatic acid, as powerful a poison nearly as aquafortis. Mr. Rafinesque states that he "never could understand why this substance was added to common salt in curing meat, except that it is said to make it look better." As this is not the object of the nitre, I will briefly state its use. By the addition of a small quantity of it, the meat is prevented from absorbing a far

greater amount of common salt, while at the same time, it is equally as liable to "keep," and in consequence of this diminished quantity of salt, the meat is rendered more tender, and retains its original sweetness to a far greater degree than it otherwise would. I would not, however, recommend a large quantity of saltpetre, as it would thus prove injurious instead of beneficial. About four ounces to every 100 lbs. of meat will be amply sufficient. At the same time a small quantity of refined sugar will materially add to its sweetness.

The very respectable source of the communication referred to above has induced me to be somewhat more lengthy in my remarks than I otherwise would have been, but I trust that the importance of the subject will be a sufficient apology.

MEDICUS.

From Goodsell's Genesee Farmer.

DOCTOR ANDERSON'S MODE OF KEEPING MILK AND BUTTER.

THE pernicious method of keeping milk in leaden vessels, and salting butter in stone jars, begins to gain ground in this country, as well as elsewhere, from an idea of cleanliness. The fact is, it is just the reverse of cleanliness; for, in the hands of a careful person, nothing can be more cleanly than wooden dishes: but, under the management of a slattern, they discover the secret when stone dishes do not. In return, these latter communicate to the butter and the milk which has been kept in them a poisonous quality, which inevitably proves destructive to the human constitution. To the prevalence of this practice I have no doubt (says the Doctor,) we must attribute the frequencies of palsies, which begin to prevail so much in this kingdom; for the well known effect of the poison of lead is debility, palsy,—leath!

From Goodsell's Farmer.

TO MAKE SALT BUTTER FRESH.

Put four pounds of salt butter into a churn with four quarts of new milk, and a small portion of arnotto. Churn them together, and in about an hour take out the butter, and treat it exactly as fresh butter, by washing it in water and adding the customary quantity of salt. This is a singular experiment. The butter gains about three ounces in each pound, and is in every respect equal to fresh butter. It would be greatly improved by the addition of two or three ounces of fine sugar, in powder. A common earthen churn answers the same purpose as a wooden one, and may be purchased at any pot shop.

From the American Farmer.

THE MOON.

It has been a question with us whether a periodical would not be as usefully employed in dissipating error as in disseminating information. As it respects the influence of the moon on the weather, on crops, &c., we have no doubt that the general belief in it has done as much harm to the agricultural interest, as any other evil with which farmers and planters have to contend. How often do farmers omit a favorable season to plant a crop of potatoes, &c., because it is not 'the right time of the moon.' Many people will not kill

hogs or beef, unless at a particular time of the moon. And when the 'right time of the moon' does come, it is at least an equal chance, that the state of the weather will not admit of these operations, or some other more necessary business must be performed, and of course they must be put off until the moon comes round again to the proper 'time.' Almost every body can tell what weather we are to have for the next four weeks, by looking at the new moon, and lay out their work accordingly. If the horns of the new moon are perpendicular, they say we are to have a wet moon, and at haying and harvest time, many a good crop is saved by the prompt advantage taken of every clear day; because, say they, we shall have few such days this moon. This, to be sure, is a very useful error; but its opposite more than balances the account. When the new moon shows her horns in a horizontal position, somewhat like a section of a bowl slightly inclined upon its side, then they say we shall have a dry moon, and the hay and crops are neglected, because 'we shall have plenty of dry weather this moon.' Now there is no 'old saw' more useful to farmers, than the good old adage—"make hay while the sun shines;" which means, do whatever you have to do, and can do, TO-DAY, and let the moon mind her own business, as you may be sure she is inclined to, if you will only let her alone—she cares no more for your potatoes and pork, and exercises no more influence over your operations, 'than the man in the moon.'

SAUERKRAUT, OR SALTED CABBAGE.

It is only 10 or 15 years since this article was introduced on board British ships of war, as an article possessed of valuable anti-scorbutic properties. Experience proving it to be valuable for the above mentioned qualities, it is still retained in their supplies. It has long been in use on board of German and Dutch national vessels, as well as merchant ships, the crews of which even during the longest voyages, remain perfectly free from scorbutic complaints. From time immemorial it has formed a favorite standing dish to the robust inhabitants of the north of Europe during their long and rigorous winters. It is recommended by cheapness, savor, salubrity, and simplicity of preparation. Cabbage should be taken that has sustained two or three white frosts previous to its being gathered. Sound compact heads should be chosen; the green and imperfect leaves should be carefully removed, each head divided, and the stalk cut out, then sliced fine with an instrument made for the purpose; a suitable tub, barrel shaped, should be prepared. After cutting, it should be salted with the proportion of a pint of fine salt to the bushel of cabbage, well intermingled, which may then be gradually packed in the tub pressing it continually with an appropriate wooden rammer. It should then be covered with a circular board two inches less in diameter than the tub, and a weight of 20 or 30 lbs. placed on it. In two weeks it will undergo the acetous fermentation, when it will be fit for use. Attention should be paid to it every week to skim the froth from the brine, to wash the board, stone, and sides of the tub. When Sauerkraut is taken out of the tub to

cook, it should always be washed with fresh water, and cooked without the addition of any other vegetable. A piece of fat pork, beef, or a fat goose, enclosed with the Sauerkraut in a close tin vessel and stewed three hours, forms an excellent dish, and is the more valuable as it can be had at the season of the year, and under circumstances that vegetables cannot be procured.

From the Genesee Farmer.

SUMMER FRUIT, AND FRUIT GARDENS.

I NEVER travel through the country in summer without regret on observing the small number of fine fruits at our most wealthy farmers; and what they have seems to have been obtained more by chance, than any settled plan to have them ripening in regular succession through the season. I have seen children devouring unripe cherries and apples, after our earliest varieties were gone, while a few dollars worth of trees from a nursery might have constantly supplied them with such sorts as were ripe and wholesome.

The subject may be set in a stronger light by calculation. If the price of a fruit tree be 50 cts. and the expenses of transportation and other extras should make it cost \$1 when planted, the annual interest on this expenditure would only be seven cents. Now I would appeal to any man who owns a fine fruit tree, if this is not a profitable investment of capital?

But I will make a closer calculation on a larger scale. Any independent farmer can appropriate one acre for a fruit garden without detriment to his other arrangements or business. When properly fenced against the depredations of children, suppose the garden with one hundred trees, consisting of cherries, apricots, plums, peaches, nectarines, pears, and early apples,—will cost (including the soil) \$150, then it will appear that for the annual interest (\$10 50) he may have the product of one hundred trees, all ripening in regular series, and yielding through the summer and autumn, a constant supply of the best fruit for his family. I say nothing of the crops of corn and potatoes to be raised on the ground for the first three or four years,—or of the pasture for swine after that period, leaving these to cover the expenses of destroying caterpillars, circulios, and other contingencies. *What other acre of that man's farm would yield him as much comfort?*

From the Brattleboro' Messenger.

APPLES GOOD FOR CATTLE AND HOGS.

MR. EDITOR.—Allow me, through your columns, to lay before your readers a few facts on this subject, which may perhaps prove advantageous to farmers.

About ten years ago, in that part of New-York where I then resided, it was found by actual experiment to be a fact, that hogs, turned into an orchard with only the slops of the family, would gain two pounds per day. In 1828, while living with Mr. C. of Buckland, Mass. I persuaded him, though with much difficulty, to let me give apples to his hogs, during his absence. He was gone nearly a fortnight, and on returning, came into the garden where I was and says, "S—, what in the world have you been doing to my hogs while I have been gone?" I was startled, and answered "I don't know, sir; why, what is the matter?" "Matter! why I could not get one of them out of his sty this forenoon." I was really afraid I

had somehow killed his best hog, and exclaimed, "Why, what is the matter?" "I should think you had been stretching their skins a little, for I never saw hogs fatten so fast in my life." "I have given them apples a plenty," was the reply.

A man in Brattleboro', last week, on showing me a hog that weighed nearly fifteen score, said, "Here is a hog, I am fattening entirely on sweet apples, boiled:—father thinks they are better for hogs than potatoes."

A man in Guilford, conversing on the same subject, said to me,—"There is a hog that will weigh over two hundred. I brought it home in July on my back. I have given it nothing but apples and a little slops for drink. I had no thoughts of his thriving so well; and my pigs do nicely on nothing but sweet apples."

To this list of facts I might add scores of similar ones; but a word to the wise is sufficient. Sweet apples are better than sour ones, but an occasional meal of the latter, for store or fattening hogs, I verily believe will be found to make them grow or fatten faster than so much corn. Hogs partly fattened become cloyed, dainty, and somewhat restive, and apples are just the thing to relax and open their intestines, and give them appetite and variety. And there is withal a deal of nourishment even in sour apples. A meal every day, or every other day, will help to put on the flesh faster than perhaps any other thing. Let any reader, who doubts, just try it for himself, and he will be surprised at the effect. A trial can certainly do them no harm. Store hogs that have a plenty of apples, sweet or sour, or both, will thrive remarkably well.

Apples are also good for cattle, and even for cows. On this point allow me to state what I have seen, and therefore know to be true. I proposed to this same Mr. C. of B. to give apples to his cows. "No, by no means," said he; "nothing will dry them up so fast." This he confirmed by numerous instances of cows getting into orchards and becoming dry. But after a while he consented to let me try it. I did try it perhaps ten times, giving them apples for a few days, weighing their milk, and then doing the same without giving them apples.—They gave from a quarter to one half more milk when they had apples than when they had none. The experiment satisfied Mr. C. and he bade me put up near two hundred bushels of sour apples for his cows and hogs. He gave a few occasionally to his horse. I think it was January before we gave out the last.

Ripe apples are peculiarly good for the human constitution, especially when taken in the fore part of the day. And why not equally good for beasts? I know that an opinion generally prevails that sour apples will dry up milch cows quicker than almost any thing else; and so they will when taken in too large quantities at a time. Let cows break into an orchard and fill themselves with apples until they can scarcely move, and it will dry up their milk—but not more than green corn will. Too many potatoes eaten at a time will have the same effect. But this argues nothing against a moderate quantity, and no more in the case of apples, than in that of corn or potatoes. Let any man begin with a small quantity, say less than a peck, and increase the quantity as they become accustomed to them, and a hundred to one if he does not find the growth of both store and fattening cattle and hogs, as well as the milk of his cows, to be thereby increased from a quarter to one half.

But it is objected that cattle are liable to get "choked" by them. So they are when they break into an orchard and you run to get them out. They will go to one tree and fill their mouths, and before they have masticated these sufficiently to be able to swallow them they again fill their mouths, greedy to secure as many as possible. But let them go quietly to a pile and take their own time for eating, and there is little if any danger of their choking.

Now if these things are facts, let me in conclusion ask if it is not evidently the design of God that we give our superabundance of fruit to our stock, rather than that we should distil it into a poison, the effect of which is most destructive to the mind and the body of man?

A HAS BEEN FARMER.

APPLICATION OF SALT TO TREES.

SEVERAL years since I had a large tree of the kind commonly called Balm of Gilead, properly the *populus candicans*, standing in my front yard, where it had been set as an ornamental tree before its reproductive powers were understood. Its roots extended a great distance, and every where threw out a multitude of suckers or shoots, which again taking root seemed in a fair way to convert the yard to a thicket, and bid defiance to extermination. I had witnessed the destructive effects of a few pails full of strong brine accidentally poured near the body of a tree of the same species, and I determined to make an experiment for the destruction of the tree that gave us so much annoyance. Accordingly had the tree cut down about three feet above the ground, where it was fourteen inches in diameter, and with an axe scooped out the top of the stump into a hollow capable of holding a quart of water. This I filled with salt, and pouring water upon it, kept the bason replenished with brine of the strongest kind, and when the salt was dissolved and taken up I added another small quantity. It was in the fall that the tree was cut down, and so effectually did the salt penetrate to the remotest ramifications of the roots, that of the multitude of shoots, but two or three in the spring showed any signs of life, and these soon perished. I have since tried salt upon other trees that had become troublesome; particularly the common wild meadow plum, and the black English cherry, trees which sprout in abundance, and with the same effect. It is necessary that the whole surface of the stump should be covered with brine that no part of the pores of the wood may escape, and therefore a gouge, or an axe where the size of the tree will admit, is preferable to perforations made in the top by an auger, as I have sometimes done. In this application of salt, another striking analogy between animal and vegetable physiology is shown, viz. that substances which used in small quantities are conducive to health and vigor, become deadly poison when used in quantity, or thrown into the immediate circulation.

W. G.

Otisco, Sept. 1833.

[Gen. Farmer.]

Nurseries of mulberries have been planted in various parts of the country during the past year for the cultivation of the silk worm. Successful experiments in the growth and manufacture of silk have excited emulation, and individuals are reaping large profits by it. The time is probably not distant when silk will cease to be an article of importation.—*Belvidere Apollo, New-Jersey.*

SUSPENSION RAILWAY.

THE Boston Transcript, in noticing the proposed improvements in East Boston, that is we suppose in the Islands in Boston harbor, has the subjoined account of a suspension railway :

"We were particularly interested with the novelty of a Suspension Railway, located across the marshes, for the purpose of testing, as we are informed, this truly American invention, and to correct, by actual demonstration, the many misconceptions relative to this very economical and highly important mode of transporting passengers and merchandize. Great curiosity was evinced to see how a car, intended to convey twenty or thirty passengers on two wheels only, one before the other, could run upon a single rail, which it did with perfect steadiness, and without the possibility of accident of any kind. There seemed to be but one opinion on the subject, and all were strongly impressed with the usefulness and importance of the invention. A locomotive engine was running upon the railway all the afternoon, but being in an unfinished state, it was not attached to the car. We sincerely wish success to the several projects contemplated on this island, and that the growth and prosperity of this new city may equal the hopes and industry of its enterprising owners.

From the Farmer's Register.

SKIPPERS IN BACON.

MR. EDITOR—There is a very great disposition in mankind, and in womankind too, to do things in any other way than the most direct. With many, a simple method of accomplishing an object has no charms; something of mummery and mystification is absolutely necessary to recommend a scheme to their favorable notice.

We see often in newspapers, and every year in almanacs, sage recipes for blockading smoke houses against the inroads of those destructive little animals called skippers;—and how much red pepper, trash tobacco, pennyroyal, &c. have been vainly wasted for this purpose in Virginia, nobody can calculate.

For the benefit of your readers, I give you my method of prevention. It has two recommendations—simplicity and efficiency.

Smoke the meat every day, until it is smoked enough; and on the very day that the smoking is discontinued, pack it in hogsheads, barrels, or boxes: they need not be air-tight, but it is necessary to have no holes or cracks in them large enough to admit the small fly, that is the mother of skippers. A lady to whom I communicated this plan in conversation, for the sake of convenience, used bags to keep her bacon in. Skippers were found in but one of them; and in that there was a hole.

This system has succeeded perfectly with me for several years. So far as I know it is original; but I cannot suppose that any thing so simple and so reasonable was never tried by others.

D.

THE CAP SHEAF!—The curious may see and examine for themselves, at Mr. Hatch's bar, in this town, an English Turnip, which grew in the garden of Mr. Isaac Gibson, of Rindge, weighing **SIXTEEN POUNDS**, and measuring 3 feet 8 inches in circumference.—*Keene Sentinel.*

BRIGHTON CATTLE SHOW, &c.

THE COMMITTEE ON INVENTIONS,

Consisting of E. Hersy Derby and Daniel Treadwell, Esqrs.—Report as follows:

That Messrs. Newell & Willis offered from their valuable Agricultural Establishment a great variety of articles, a part of them for Premium and a part for Exhibition only. For premium, one of Scot Keith & Co.'s cast iron Pumps, for which a premium of \$5 is awarded. One of Willis' improved Straw Cutters, for the improvement of which one of \$5 is awarded. A self operating Cheese Press, from the Shaker Village at Canterbury, N. H. one of \$10 is awarded. Also, Flagg's portable horse power Threshing Machine and Grater Cider Mill united: This Machine was accompanied with several Certificates recommending it highly; the Committee were much pleased with its operation, but as some parts of it were a little out of order, and there not being ample time to test it in every particular, it was concluded not to award a premium at present. In every instance where a premium was awarded, satisfactory certificates were produced stating the superiority of the article offered.

Among their articles offered for Exhibition only, were several of Howard's improved cast iron Ploughs, two Cultivators, a very superior portable Garden Engine, a hand Straw Cutter, and several Chains for tying up cattle, all of which did credit to their establishment.

Adam Brooks of Scituate offered for Premium a Silk Spinner and Twister, with several Certificates, recommending it very highly, a variety of samples of its work were exhibited, the operation of winding off the Silk from the Cocoons, the spinning and doubling and twisting of the Sewing Silk was performed in the presence of the Committee. This machine operates well, and in the infant state of the Silk Manufacture in this country, the Committee recommend the encouragement of it, by a premium of \$20.

To Carver Washburn of Bridgewater, for his improved Cast Iron Wheel Hubs with composition boxes, together with their axletrees, which were highly finished, and accompanied with very satisfactory certificates a premium of \$5.

To Nathaniel S. Bennett of Framingham, for Wrought Iron Bows, for tying up Cattle, certified as an improvement, a Premium of \$2.

Messrs. Prouty & Mears, Plough dealers, No. 12, Commercial Street, Boston, offered from their Store a variety of articles for exhibition only. Among which, were a great number of Ploughs, several cast iron Wheel Hubs, patent bored Pipe Boxes, an improved cast iron lock Tug Pin, and a pair of cast and wrought iron improved rolling galling irons for the sides of Wagons. The superiority of the cast iron Wheel Hubs over the wooden ones was particularly pointed out in the statement furnished by them. The whole of these articles do them great credit.

P. Washburn & Co. of Middleboro', offered for exhibition a large lot of shovels, of different patterns, made at their Manufactory under the direction of Mr. George Ames. All of them were highly finished and excellent tools.

J. C. Hewin offered 4 pitchforks of a superior quality.

Cassander Gilman and Elias Hall of Raynham, and Joseph Silvester, each of them offered a cast

iron Plough, all three of which were well finished implements.

Several small articles were offered, but as they could not be said to appertain particularly to Agriculture, it was thought inexpedient to mention them.

E. HERSEY DERBY.

DANIEL TREADWELL.

Brighton, 16th Oct. 1833.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS AT THE MASS. HORT. SOC. ROOMS.

Saturday, Nov. 2d, 1833.

PEARS. By Mr. B. V. French, Chaumontelle, a superior old French pear, but now extremely liable to blight.

By Mr. Richards, Crassanne, another superior old French variety, but like the preceding extremely subject to blight. Neither of these varieties can be recommended for profitable cultivation near Boston.

By Mr. Downer, Crassanne; also, the Beurre Diel, very large and fine, a new Flemish winter pear, of first rate quality, the skin is rough and thick, a valuable quality in a keeping pear, reputed a great bearer.

By Messrs. Bloodgood & Co. of Long Island, Bleecker's Meadow, very sweet.

By Mr. Samuel Hastings of Boston, St. Michael, very fair and fine.

By Mr. Vose, Napoleon Pears, very fine and delicious.

By Mr. Alexander Young of Boston, large baking Winter Pears—the same kind exhibited by him on some former occasions—an old French fruit of extraordinary size, some of them have weighed 29 ounces.

By Mr. Manning, a roundish Pear, name unknown—a fruit of middle size, of a golden russet color, melting and sweet.

APPLES. Of Apples as of Pears, some very fine specimens were exhibited this day.

By Mr. Mackay of Weston, Mackay Sweeting, a large, round and very sweet apple, fine for flavor and for keeping; also, native apples, the first fruits—one a fine good sized apple, of a conical form and pleasant flavor; Baldwin, Greening and Russets, all very handsome specimens.

By Mr. Richards, Lady Apple, a small apple admired chiefly on account of its great beauty.

By Mr. B. V. French, Nonsuch, Black apple; also, Red Everlasting, a beautiful red apple of good flavor.

By Mr. Downer, a large apple, unknown, roundish, pale straw color and red, now nearly ripe and fine flavored; Ramshorn apple; also, Bruxelles Pippin, a large and beautiful fruit of excellent quality. From an unknown source, an apple, half pippin half russeted.

PEACHES. By Mr. Richards, Heath Clingstone, very fine.

QUINCES. By Mr. Joseph Head of Boston, a specimen of the Orange Quince, very large and beautiful.

By Mr. B. V. French, specimens of very fair Quinces.

By Mr. Vose, Portugal Quinces of very fair appearance. Also, Orange Quinces, equally extraordinary for their size and great beauty.

GRAPES. By Mr. Balch, Malvoisie, much resembling the Lombardy if not identical.

By Mr. Joshua Child of Boston, Grizzly Tokay.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 6, 1833.

ON Thursday last, the Hon. Mr. CLAY visited the Ten Hills Farm of Col. Jacques, in the neighborhood of Boston. Mr. Clay appeared very well pleased with Col. Jacques' stock of different and excellent breeds, and pleased every body present by his affability and pertinent remarks on the excellences and peculiarities of the different animals, which Col. Jacques submitted to his inspection. It was evident that Mr. Clay was a *connoisseur* as well as an amateur of agriculture, as much at home in the field of the Farmer as at the cabinet of the Statesman; and left a very favorable impression on the minds of a number of our most distinguished cultivators, and other pillars of the farming interest, who met and accompanied him on the excursion.

Afterwards, Mr. Clay visited the Agricultural Warehouse, Seed Store and Office of the N. E. Farmer, and gave the sanction of his approbation to the tools, machines and specimens of agricultural and horticultural improvement which are exhibited in that establishment.

A super superb Beet. Mr. J. A. Kenrick of Newton, Mass. exhibited at the rooms of the Mass. Hor. Society on the 2d inst. a BEET of the Mangold Wurtzel variety, which very far exceeds any thing and every thing of the kind, which we have ever heard, seen, or read of in verity, poetry, romance, Scott's Novels, Robinson Crusoe, or Arabian Nights' Entertainment. This enormous, overgrown, unwieldy vegetable would make a full meal for a Mammoth, and bait the largest herd of Buffaloes that ever pervaded a prairie in the Valley of the Mississippi. It weighed, what d'ye guess? Well, I'll tell you, to wit: It weighed even THIRTY-SIX POUNDS FOUR OUNCES! Before you deny this assertion please to call at the New England Farmer Office, No. 52 North Market Street, where room has been made for its deposit, and it may be seen gratis by practical and Amateur Cultivators.

From Fessenden's N. E. Farmer's Almanac.

STIFF, hard, cloggy arable land, is best ploughed in autumn, that frost may assist in pulverizing it. But if your soil is loose and sandy, it may be best to let it lie and consolidate through the winter. Barricade your cellar and barn, &c. as much as possible against the intrusion of frost. The only banks with which a good farmer ought to have any dealings are such as are of use to preserve his cellar from frost. You may now carry out and spread compost, soot, ashes, &c. on such of your mowing ground as needs manure, though some say that the best time for top-dressing grass land is immediately after haying. Any time, however, will do, when the ground is free from frost and snow. But previous to manuring your grass ground, it will be advisable to harrow or scarify it. Also, it will often not be amiss to sow grass seeds at the time you manure and harrow as aforesaid, to produce a new set of plants and supersede the necessity of breaking up the soil to prevent its being 'bound out,' as the phrase is. Now is as good a time as can be for collecting fallen leaves, and the mould caused by their decay to litter cattle, mix with farm-yard dung, use in making hot beds, manure for fruit trees, &c. Attend to your water-courses, ditches, &c. and please to manage

in such a manner that your mowing ground may be benefited by the wash of the highway.

From Fessenden's N. E. Farmer's Almanac.

FOOD FOR FATTING CATTLE.

It has been often said, and we believe correctly, that it is not profitable, generally speaking, to fatten cattle on any kind of grain. Lawrence, on Neat Cattle, asserts that 'corn [by which is meant oats, barley, rye, peas, beans, wheat, &c.] cannot be used in the fattening of bullocks and sheep except in seasons of superabundant plenty.' Even Indian corn is often too costly food to be used solely or chiefly for the profitable fattening of cattle; and grass, hay and roots are the materials, which true economy requires.* It is, however, asserted that beef fattened on oil cake, raw potatoes, turnips, &c. will not be so firm, nor of so good a quality, other things being equal, as that which is fattened on Indian corn. If that be true, it might be well to commence feeding with turnips, potatoes, &c. and give the animals richer food as they increase in fatness. An able writer observes that, 'with respect to feeding, the first rule is, little at a time and often; because experience has shown that animals that eat much in a short time do not fatten so well as those which eat less, but more slowly and frequently. The second rule is to begin the course with cabbage and turnips; then to employ carrots and potatoes, and lastly, Indian, oat, or barley meal, the March bean, or the grey pea.—These aliments ought to be varied five or six times a day, and oftener if convenient; and instead of always reducing them to flour, there is an advantage in sometimes boiling them. A little salt, given daily, is very useful.'

It would be advantageous to the community of farmers, if something like the following experiments were made and their results published. Let a number of cattle of similar or the same breed, age, propensity to fatten, as ascertained by hand, &c. &c. be fattened at the same time. Let one be fed entirely on potatoes raw, a second on the same foot, steamed or boiled, a third be made one half or two thirds fat on potatoes, and his fattening completed with Indian corn; a fourth be fatted on Indian corn or corn meal; a fifth be fed with a mixture of all these kinds of food, given together in the same mess, or in different messes. The first food in the morning for the last mentioned bullock, might be a small quantity of potatoes, pumpkins, or turnips; the second, ruta бага or carrots, mangel wurtzel or parsnips. Then, as the last course of the day's feast, give Indian meal or other food, the richest you have. It would be well likewise to try the virtues of sweet apples. The most important object of such experiments, however, would be to ascertain whether the beef of cattle fattened on potatoes or other roots, raw or boiled or steamed, is equal in quality to that which is fattened on Indian corn. If not, whether an ox may not be made nearly fat enough for profit on roots and hay, his fattening completed on corn, and the flesh be as good as if he had been fattened wholly on corn. And if an ox partly fattened on roots, and his fattening completed on corn gives as good beef as one wholly fed on corn, the question arises, *how long a time* will it require to give the beef its good qualities arising from the corn? We know, as respects swine, that farmers make

* See a Communication for the New England Farmer. Vol. I. p. 234.

them partly fat on any thing which they will devour, and then feed them for some time before they are killed with Indian corn or meal to 'harden the flesh,' as they express it. And perhaps the same process will answer as well for beef cattle. Some farmers say that the red or La Plata potato, given raw to swine, makes as good pork as that which is corn fed. Others say that any kind of potato, if steamed or boiled, will make as good pork as can be made of corn. If this be true of pork, it may be so of beef.

It is a truth, which has been confirmed by repeated experiments, that food for swine, fermented and become a little acid, will go farther and fatten them faster than unfermented food of the same quantity. But it is not, we believe, generally known in this country that acid food is most valuable for neat cattle in certain circumstances. Mr. Bordley, (a celebrated American writer on Rural Economy,) however, asserts, that 'Oxen made half fat, or in good plight, on grass or turnips, are then soon finished in France, upon a sour food, prepared as follows: rye meal, (buck wheat or Indian corn meal may be tried) with water, is made into a paste, which in a few days ferments, and becomes sour; this is then diluted with water and thickened with hay cut into chaff, which the oxen sometimes refuse the first day, but when dry, they drink and prefer it. All the husbandmen are decidedly of opinion that they fatten much better because of the acidity. They give it thrice a day, and a large ox thus eats 22 lbs. a day. Maize [Indian] meal, or maize steeped till sour, should be tried. This sour mess is given during the last three weeks of their fattening, and they eat about 7½ bushels of meal, value four dollars.

Care should be taken that the process of fermentation be not carried too far. The paste should not become mouldy, nor the liquid food in the slightest degree putrid. We think, moreover, that there is reason in waiting till animals become 'half fat,' or in good plight before they are fed with acid food. Acids, like alcohol, create appetite by stimulating the stomach but if long continued, they weaken the digestive powers, and in time totally destroy the tone of the stomach. The animal will then be visited, with what in a human subject would be called dyspepsia, or a want of the power of digestion; fattening him will be out of the question, and he will be worth but little more than the value of his hide. The constitution of an ox may be destroyed by excessive eating, and it is only towards the close of his days, near the last stage of his preparation for the butcher, that he should be allowed to become an epicure, and indulged with as much as he can eat of rich and high seasoned food.

Store keep should neither be too rich nor too abundant; and if an ox is once made fat, and then loses his flesh, he is like one of Pharaoh's lean kine, the more he devours, the leaner he becomes. If young cattle are kept in rich pastures in summer, and poor fodder in winter, sometimes stuffed, at other times starved, they lose their disposition to fatten. To such cattle Mr. Lawrence alludes, when he says, 'It is extremely imprudent, indolently to continue at high keep, animals which do not thrive; I advert chiefly to individuals, with which the first loss is always the least.' 'Stock cattle,' said Mr. Bordley, 'are kept, others are fattened. The feeding is different. Cattle kept, need no kind of grain, nor even hay, unless to cows about calving time. Straw, with any juicy food

such as roots or *drank*,* abundantly suffices for keeping cattle in heart through the winter, provided they are sheltered from cold rains. Mr. Bakewell kept his fine cattle on *straw and turnips* in winter. 'A *drank* for keeping cattle may be made thus: roots, chaff, or cut straw and salt, boiled together with a good quantity of water; the roots cut or mashed. The cattle drink the water, and eat the rest. *Drank* for fattening cattle thus: roots, meal, flax-seed, chaff, or cut straw and salt, well boiled together in a plenty of water. If given warm, not hot, it is better.' The same author says, 'Hay, meal, and linseed jelly, with drank, must be excellent food in stall fattening. Linseed-jelly is thus made: seven quarts of water to one of flax-seed, steeped in a part of the water 48 hours; then add the remaining water, cold, and boil it gently two hours, stirring constantly to prevent burning. It is cooled in tubs, and given mixed with any meal, bran, or cut chaff. Each bullock (large) has two quarts of *jelly* a day; equal to a little more than one quart of seed in four days.'

*The word *drank* is given us by Count Rumford, for distinguishing this composition from common water.

Mistake relative to Toasts at the Brighton Show.—In our last paper, (page 126) a material mistake was made, as respects Mr. Welles' Toast, and the occasion which introduced it. The remarks made by Mr. Welles' on the display of the large apple raised by Gov. Lincoln, were in allusion to the successful efforts of the Governor as a cultivator, and the toast itself, which followed his remarks was omitted. The toast was

The President of the Worcester Agricultural Society. May he go forth to his agricultural pursuits, though he may make it unsafe to pass through the orchard.

The well merited compliment, paid to the Orator of the day, was from another source.

COUNTRY SEAT AT AUCTION.

To be sold at Auction, on Wednesday, November 6, at 11 o'clock, on the premises, (unless previously disposed of at private sale) the estate of the subscriber, situated in upper Beverly, called Cherry Hill, four miles from Salem, and about seventeen from the city of Boston, consisting of 200 acres of tillage and pasture land in good condition, with the dwelling-house, barns, out houses, and other buildings thereon situated, including several lots of wood land, peat meadow, &c. The view from the dwelling-house is extensive and commanding, and embraces, beside the towns for many miles in the interior, the whole of Massachusetts Bay, from the Light House on Baker's Island, to Nahant and the islands adjacent. The fruit trees are numerous and of great variety, having been selected with much care and attention, for the last thirty-five years. The property is a desirable one for farming purposes, or as a pleasant and convenient country residence.

At the same time, will be sold the live stock, farming utensils, and produce; consisting of oxen, cows, horses, wagons, carts, ploughs, potatoes, corn, hay, &c.

Also, a Pew in the Meeting-house. Enquire of Mr. WM. NUTTER, on the premises, or of STEPHEN WHITE, No. 7 Somerset Street, Boston. oct 23.

FRUIT AND FOREST TREES, &c.

BLOODGOOD & CO. have for Sale at their Nursery at Flushing, L. I. near New York, a large assortment of the most approved American and European sorts of Apple, Pear, Peach, Cherry, Plum, Apricot, Nectarine and Quince Trees, hardy Ornamental Trees, flowering Shrubs and Plants, of almost every description usually kept in Nurseries. Of the *Pear Trees* they have a large stock and of good growth, amongst which are most of the celebrated new sorts. About eight thousand of the *Morus Multicaulis Mulberry Trees*, so much esteemed for the feed of the Silkworm, which they will sell at Twenty-five Dollars per hundred. To Nurserymen who want to increase their stock or to sell again, liberal discount is made, excepting on the *Morus Multicaulis*. The *Fruit Trees* in this Establishment are all grafted or inoculated by the Proprietors, who feel confident in their being correct. Orders forwarded by mail to THOMAS BLOODGOOD, No. 208 Front Street, New York, or to BLOODGOOD & Co. Flushing, L. I. will be particularly attended to. Catalogues may be had of Geo. C. Barrett, at the Agricultural Warehouse, No. 52 North Market Street. St o 16

NEW ENGLAND FARMER'S ALMANAC FOR 1834.

JUST published and for sale by Geo. C. Barrett, No. 52 North Market street. The New England Farmer's Almanac, for 1834, by T. G. Fessenden, editor of the N. E. Farmer.—Astronomical calculation by R. T. Paine, Esq. Dealers supplied on liberal terms. oct 9

JOHN SCOTT'S LEGACY.

THE Board entrusted with the management of the fund bequeathed to the Corporation of Philadelphia, by the late John Scott of Edinburgh, "for distribution of premiums to ingenious men and women, who make useful inventions," hereby give notice, that in three months from this date they will award a premium to Adam Brooks of West Scituate, Massachusetts, for an apparatus for—1. Reeling Silk from Cocoons: 2. Spinning or Twisting the Silk: 3. Doubling and Twisting it—all by one operation, provided satisfactory objections to the originality of said apparatus are not made in the meantime. The Members of the Board are.

JAMES MEASE,
ROBERT HARE,
JAMES DONALDSON,
WM. HEMBEL,
WM. PHILLIPS.

To any of whom application for premiums may be made. Philadelphia, Oct. 22, 1833. oc 23-d3tG.

SITUATION WANTED.

BY an experienced Gardener; one who thoroughly understands the propagation of Green House Plants, Grape Vines, &c.—Good reference as to character and capability can be given. Apply at this office. if oct 9

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sept 11 eow6w

WM. PRINCE & SONS,

—Deeming it unnecessary to have any Agent, request all orders to be sent to them *direct per mail*, and they will receive prompt attention, and be forwarded precisely as desired. Catalogues will be sent gratis to every applicant.

N. B. *Morus Multicaulis*, or Chinese Mulberry, \$25 per 100, and \$4 1-2 per dozen.

Linnæan Botanic Garden and Nurseries,
Flushing, Oct. 8th, 1833. o 23

BUCKTHORNS.

Buckthorns for Hedges for sale at \$3 per 100 for large ones, and small thorns in proportion, by G. C. BARRETT.
N. B. These are the genuine thorns, raised upon the farm of E. H. Derby, Esq. o 23

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus MULTICAULIS* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Pæonies*, *Moutan* and *Papanavacea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

BRIGHTON MARKET.—MONDAY, NOV. 4, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 4375 Beef Cattle, 240 Stores, 3200 Sheep, and 420 Swine.

PRICES. *Beef Cattle*.—Prices did not vary much from last week, there were many very fine Cattle at market. We noticed ten beautiful Steers, fed by S. Allen, Esq. of Fairfield, Con. but did not learn the price; we also noticed some others, very fine, were taken at \$5 25, and 5 50. We quote prime at 4 75 and \$5; good at \$4 25 a 4 50.

Barrelling Cattle.—Mess \$4 a 4 12; No. 1, 3 50 a 3 62; No. 2, 3 a 3 25.

Sheep.—Lots were taken at \$1 50, 1 60, 1 75, 1 83, 1 96, 2 17 and 2 25. Wethers 2 75, 3 a 3 50.

Swine.—In good demand; we noticed two or three lots of Barrows, taken at 5; a lot of Sows and Barrows, at 4 1-2. At retail, 5 for Sows, and 6 for Barrows.

WANTED.

HERDS GRASS, CLOVER, RED TOP. Of the growth of 1833 and of good quality.

ALSO—Flax and Hemp seed, for which cash will be paid. oct 9

MISCELLANY.

From the Token, for 1834.

THE PLAGUE IN THE FOREST.—A FABLE.

By JOHN QUINCY ADAMS.

TIME was when round the Lion's den,
A peopled city raised its head;
'Twas not inhabited by men,
But by four-footed beasts instead.
The lynx, the leopard and the bear,
The tiger and the wolf were there;
The hoof-defended steed;
The bull, prepared with horns to gore—
The cat with claws, the tusky boar,
And all the canine breed.

In social compact thus combin'd,
Together dwelt the beasts of prey;
Their murd'rous weapons all resign'd,
And vow'd each other not to slay.
Among them, Reynard trust his phiz;
Nor hoof, nor horn, nor tusk was his—
For warfare all unfit;
He whispered to the royal dunce,
And gained a settlement at once;
His weapon was—his wit.

One summer, by some fatal spell,
(Phœbus was peevish for some scoff,)
The plague upon that city fell,
And swept the beasts by thousands off.
The lion, as became his part,
Lov'd his dear people from his heart,
And taking counsel sage,
His peerage summon'd to advise
And offer up a sacrifice,
To soothe Apollo's rage.

Quoth lion, 'We are sinners all;
And even, it must be confess'd,
If among sheep I chance to fall—
I, I, am guilty as the rest.
To me the sight of lamb is curst,
It kindles in my heart a thirst,
I struggle to refrain,
Poor innocent! his blood so sweet!
His flesh so delicate to eat!
I find resistance vain.

'Now to be candid, I must own,
The sheep are weak, and I am strong—
But when we find ourselves alone,
The sheep have never done me wrong.
And, since I purpose to reveal
All my offences, nor conceal
One trespass from your view;
My appetite is made so keen,
That, with the sheep, the time has been
I took—the shepherd too.

'Then let us all our sins confess,
And whose soe'er the blackest guilt,
To ease my people's deep distress,
Let his atoning blood be spilt.
My own confession now you hear—
Should none of deeper dye appear,
Your sentence freely give:
And if on me should fall the lot,
Make me the victim on the spot;
And let my people live.'

The council with applauses rung,
To hear the Codrus of the wood;
Though still some doubt suspended hung,
If he would make his promise good—
Quoth Reynard, 'Since the world was made
Was ever love like this displayed?
Let us, like subjects true,
Swear, as before your feet we fall,

Sooner than you should die for all,
We all will die for you.

'But, please your majesty, I deem,
Submissive to your royal grace,
You hold in far too high esteem
That paltry poltroon, sheepish race:
For oft reflecting in the shade,
I ask myself why sheep were made
By all-creating power?
And howsoe'er I tax my mind,
This, the sole reason I can find—
For lions to devour.

'And as for eating, now and then,
As well the shepherd as the sheep;
How can that braggart breed of men
Expect with you the peace to keep?
'Tis time their blustering boast to stem,
That all the world was made for them,
And prove creation's plan;
Teach them, by evidence profuse,
That man was made for lion's use,
Not lions made for man.

And now the noble peers begin;
And, cheer'd with such example bright,
Disclosing each his secret sin,
Some midnight murder brought to light.
Reynard was counsel for them all;
No crime the assembly could appal,
But he could botch, with paint;
Hark! as the honeyed accents roll,
Each tiger is a gentle soul;
Each blood-hound is a saint.

When each had told his tale in turn,
The long-eared beast of burden came,
And meekly said—'My bowels yearn
To make confession of my shame:
But I remember on a time,
I pass'd, not thinking of a crime,
A hay-stack on my way;
His lure some tempting devil spread—
I stretched across the fence my head,
And cropp'd—a lock of hay.

'Oh monster! villain!' Reynard cried—
'No longer seek the victim, sire;
Nor why your subjects thus have died,
To expiate Apollo's ire.'
The council, with one voice, decreed,
All joined to execrate the deed—
'What! steal another's grass!'
The blackest crime their lives could show,
Was washed as white as virgin snow;
The victim was—THE ASS.

There are few wants more distressing than the want of some useful occupation, for activity of the faculties is the fountain of enjoyment.

Cunning is the most silly of all things, for those who often undertake to outwit others, and become notorious for being sharp folks, eventually outwit themselves, and honest men will shun them as they would a contagious disorder.

The most trifling promise a parent can make to children should always be adhered to; for negligence in that particular teaches a lesson of deceit.

Carefully observe every action of a child, which is praiseworthy, and let if possible a reward accompany it; for the encouragement of one virtuous impulse will have a happier effect than the correction of a hundred faults.

A person bemoaning the uncomfortable prospect of celibacy, and comparing the respective

situations of married and single persons, exclaimed, "What can make the bitter cup of a bachelor go down?" A wit in the company, assuming the tone and manner of the complainant, exclaimed "a lass! a lass!"

A gallant officer of the American navy on visiting the State Prison of Massachusetts with a friend, observed that he should have no objections to such a crew as could be formed of the prisoners. "True," replied his companion, "and you would have this advantage, they would be all *tried* men."

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. NO. 18.

From the Massachusetts (Worcester) Spy.

REPORT

OF THE COMMITTEE ON LEATHER AND MANUFACTURES OF WOOL,

Made at the Cattle Show, Worcester, Oct. 9, 1833.

EMORY WASHBURN of Worcester, Chairman; LEVI A. DOWLY of Worcester, WILLIAM M. BENEDICT of Millbury, ELI WARREN of Upton, and CHARLES PARKMAN of Westborough—Committee.

The Committee upon Leather and Manufactures of Wool having attended to their duty, direct me to Report—

Although the number of articles which have come under their observation has been less numerous than have sometimes been offered, the exhibition in this department has been one of much interest.

Their attention was first directed to the samples of Leather.

There are few things less inviting than the raw materials which the tanner and currier undertake to work into one of the most essential articles of comfort and luxury of man.

But that the arts of tanning and currying can convert very unsightly materials into objects of beauty, the specimens of Leather offered this day have most conclusively shown.

There were no specimens of Sole Leather or Morocco, and only three lots of Calf Skins; one offered by Messrs. E. H. & G. Bowen of Leicester, one by Waterman G. Warren of Ward, and one by Charles Goulding of Grafton.

The lot offered by Mr. Warren was highly finished, but the lot offered by Messrs. Bowen was better tanned, and were thought on the whole, deserving the premium of \$7, offered by the Society.

As there was no Sole Leather offered the Committee hope and recommend that the Society should give a gratuity of \$3 to Mr. Warren, for the lot offered by him.

The skins offered by Mr. Goulding were considered a fair lot, and he deserves credit for his endeavor to give interest to the show.

Mr. Samuel B. Scott of Worcester, who has heretofore exhibited specimens of great skill and neatness as a worker of Leather, presented two pairs of Boots for exhibition, one of which, on account of their workmanship, excited admiration, and were thought by your Committee deserving a gratuity of \$1.

From these products of the shop your Committee turned with great pleasure to the specimens of Household and Domestic Manufactures, which decorated a goodly portion of the hall of exhibition. If your Committee possessed one spark of romance, they might be suspected of extravagance in the encomiums which they would be glad to confer upon this part of the exhibition. For, verily, if the proverb-making king of Israel could have seen a Worcester County Cattle Show, he could not more accurately have described, than he has done, her wives and daughters whose "price is above rubies," "who seek wool and flax and work willingly with their hands," who "lay their hands on the spindle," and "whose hands hold the distaff."

If the Committee had had the power, not one competitor should have gone away without a prize

As it was, they gave to all they could, and now publicly give their thanks to all upon whom they could not bestow any more tangible marks of their commendation.

There were seven pieces of Carpeting offered: one by Miss Hannah Brown, of Rutland, of 31 yards; one by Mrs. Thomas J. Davis of Holden; one by Mrs. Mary Flagg of West Boylston, of 28 yards; one by Harriet P. Dana of Oxford, of 26 yards; one by Mrs. Susan Johnson of Rutland, of 27 yards; one by Annis Davis of Paxton, and one by Miss Mary Bartlett of Northborough, of 35½ yards. All except that of Harriet P. Dana were striped and woven in imitation of what are called Venetian Carpets. That of Harriet P. Dana was of cotton, and woven in imitation of what are called Kidderminster Carpets. The colors were generally bright and permanent, and the materials well wrought.

There was some diversity of opinion in the Committee as to the first premium of \$12, but it was at last awarded to Mrs. Mary Flagg. The second premium of \$8, was awarded to Mrs. Davis of Holden; and the third premium of \$5, to Miss Johnson.

Mrs. Jeremiah Robinson of Worcester offered a Carpet woven from "listings," which, from its neatness and beauty, would have been recommended as deserving a gratuity if, from its being entertained for exhibition only, it had not been thought by the Committee more consistent with the wishes of that body to pass it with the commendations which it deserved.

There were only two pieces of Flannel offered, and your Committee do not hesitate in awarding the first premium of \$6, to Mrs. Tirza Nichols of Charlton, for the very beautiful piece which she offered; and the second premium of \$5, for the piece offered by Mrs. Lucy Marsh of Sutton, for the Committee think it would have been difficult to have surpassed these had other competitors offered. The Flannels offered were so soft, so fine, and withal bespoke so much comfort in their very touch, that one would almost wish for cold weather all the year round for the mere pleasure of wearing them.

The Committee were of opinion that a gratuity of \$1, should be given to Mr. Thomas Nichols of Charlton, for a piece of striped woollen Frocking exhibited by him, both on account of the quality of the cloth and the respect which they entertain for a neat, comfortable, genuine Frock in these degenerate days, when a Frock-coat is thought so much more of as a mark of a gentleman, than the good old *habits* of our fathers.

The Committee also awarded a like gratuity of \$1, to Mrs. Abigail Pratt of Oxford, for a handsome specimen of green domestic Moreen, which it was understood was designed for very useful, though not showy, because not outside garments.

The Committee would be doing great injustice to their own feelings if they were to pass unnoticed two pieces of black and one of slate colored Cassimere, and a piece of invisible green Broadcloth, which were offered for exhibition by John Brown, Esq. of the Dudley Woollen Manufacturing Company. It is perhaps known by all the Society that no premium is offered for cloths of this kind. If,

therefore, there had been nothing in the quality of these cloths deserving notice, the spirit manifested by those who presented them is deserving of great praise. The cloths, however, were of such a character as to do justice to the County whose prosperity is so much identified with the success of American Manufactures. The Committee would have regretted in common with all who were present, if on this occasion there had been no such manufactures exhibited. Experience has taught us all that the farmer and manufacturer must stand by each other or they cannot stand at all. And while a portion of our Union looks with jealousy upon our industry and prosperity, the agriculturist and manufacturer should, on every suitable occasion, cheer and encourage each other to the struggle that seems to be approaching in which public sentiment should be the only engine of conflict.

Under these impressions, your Committee are unanimously of opinion that, as a slight token of the interest which this Society feel in the success of the manufacturing system, they should appropriate as a gratuity the sum of \$10, to be paid to the Dudley Manufacturing Company.

There was a fine show of Coverlets and Blankets on this occasion. Warmth, comfort and repose seemed to constitute the very ingredients of this part of the exhibition, and wrapped in articles like these one could never, while in health, need the aid of soporific draughts, nor sigh to be fanned to repose by a West Indian slave.

There were six woven Coverlets offered for premium; one of woollen patchwork, of great durability and excellent workmanship, was offered by Mrs. Sylvia Adams of Worcester.

The woven Coverlets were of cotton and wool, and were presented by the following persons: Serephina Chaffin of Holden, Mrs. H. Howard of Worcester, Miss Rebecca L. Sweetser of Worcester, Mary Chaffin of Holden, Nancy Converse of Spencer. Of these, all excellent of their kind, the Committee were of opinion that Miss Sweetser was entitled to the first premium of \$4—Mary Converse the second premium of \$3—and that a gratuity of \$1, should be given to Mrs. Howard.

No specific premium was appropriated by the Society for Blankets. But your Committee were of opinion that a pair of Rose Blankets exhibited by Mrs. Pickard of Worcester, richly deserved a gratuity of \$2, for their softness, fineness and beauty. Miss Sweetser offered a checked woollen Blanket, of which the Committee need only say that it deserved to be laid next to the Coverlet for which she has been awarded the first premium.

There were two lots of Men's Half Stockings or Hose offered for premium, and, by their quality, were thought fully deserving the premiums of the Society. To Miss Adeline Marsh of Sutton, for two pairs Half Hose, the Committee award the first premium of \$3; and to Miss Brooksey Marsh of Sutton, for two pairs, the premium of \$2. In such Hose as these no man need be ashamed to put his feet wherever his head shall have wit to introduce him.

There was a lot of fifty pairs of cotton and woollen Stockings and Half Stockings, presented for exhibition by Mr. Hitchcock, the Steward of the Insane Hospital in this town, which had been

knit during the past season by the female inmates of that institution. They were designed for the use of the inmates, and were in good keeping with the neatness and comfort of any thing in and around that noble establishment. And while witnessing these samples of the profitable and pleasant employment of that unfortunate class of the community, the Committee could not forbear recalling the happy change which has taken place in their condition through the liberal bounty of the State, and under the kind and paternal care of the superintendent and subordinate officers and attendants of that admirable institution.

Among those articles of "skill and utility," to the encouragement of which the Committee were permitted to appropriate gratuities, they would mention a Hearth Rug offered by Mrs. Hannah Wheeler of Grafton; two Hearth Rugs by Mrs. Abby C. Snow of Fitchburg; three Stool or Chair Coverings by the same lady; and a braided List Mat or Rug by Miss Eliza Earle of Leicester.

We could not look upon these articles of household industry, without recalling the change that has taken place in the condition of man within a little more than two centuries, when, if historians tell us truly, even upon the floors of palaces in the land of our ancestors, rushes were strewed as their only covering, and but half concealed what they served only to disguise. Now every farm-house has its carpeted parlor, and though we see not the mailed warrior and his steed, or the shepherd and his flock upon the storied tapestry that adorns the walls, we see, as we have seen to-day, animals of every kind and flowers of every hue, reposing in needlework upon our hearth rugs and our chair coverings. Economy, too, has kept pace with comfort and neatness, and we were credibly assured that all the articles offered by Mrs. Snow were wrought from materials which are usually thrown away, thus showing how industry and skill and genius can transform even worthless shreds into articles of utility and show.

The Committee recommend a gratuity of \$2, to Mrs. Snow, and of \$1, to Mrs. Wheeler; and to Miss Earle they tender an assurance that her Mat was not passed by from any want of disposition to reward it.

Miss Mary Ann Wood of Upton, exhibited two Crickets or Foot Stands, the coverings of which were beautiful specimens of needlework from her hands. They were fit for the foot of Royalty itself, or what is more, for the prettiest daughter of the best farmer in the County of Worcester; and by the unanimous opinion of the Committee are recommended to a gratuity of \$1. They would only add the hope, that articles that look so pretty in pairs may not long remain the sole property of the lady who presented them for exhibition.

Two Lamp Mats and two smaller Mats were offered by Miss Mary M. Stiles of Worcester, which were wrought by her own needle, and were specimens of exquisite workmanship. They would lend beauty, if not lustre, to whatever they might be applied, and the Committee cheerfully recommend a gratuity of \$1, to be paid as a testimony of their opinion of these productions of female taste and skill.

Two other Lamp Mats were offered by Miss Anne Janet Ware of Shrewsbury, aged 10 years, and gave such evidence of skill in the use of the needle, that the Committee, as a token of their approbation, awarded to her a gratuity of half a dollar, not doubting that Miss Ware will hereafter win nobler prizes in the competition of merit.

The Committee have thus gone through with the performance of the duties of their appointment, and were they to repeat the expressions of pleasure with which they have performed this duty, they would only reiterate the expressions of all who have examined the same specimens of the domestic arts.

Others may seek for the beautiful productions of art abroad in the decaying and impoverished cities of the old world, and forget that we have objects of interest at home; for ourselves, we should seek in vain for objects more gratifying to our feelings as citizens of New England, than the samples of the productions of the domestic arts which we have this day witnessed, which tell in language not to be misunderstood, of the comforts, the luxuries, and the independence which make a New England man's home the best and the brightest spot on earth.

By order, EMORY WASHBURN, *Chairman*.

For the New England Farmer.

**ABRIDGED REPORTS OF COMMITTEES,
MADE AT WORCESTER CATTLE SHOW, OCT. 1833.**

Working Oxen. Nathaniel P. Denny of Leicester, Chairman; Salem Towne of Charlton, Daniel Tenny of Sutton, Amory Holman of Bolton, and Lovett Peters of Westborough—*Committee*.

There were 17 teams entered for premium. The first premium was awarded to Isaac Hathaway of Sutton, for his four years old oxen. The second of \$10, to James Taylor of Sutton, for his four years old oxen. The third of \$8 to John Spurr of Charlton, for his five years old oxen. The fourth of \$5, to Stephen Mark, jun. of Sutton, for his four years old oxen.

If the Committee could have disposed of any more money in premiums, they observed that they would have given it to Arnold L. Allen of Shrewsbury, and Simon Carpenter of Charlton; and recommended a gratuity of \$3 to each of these gentlemen.

"The Committee noticed with great satisfaction and approbation the skilful and humane management of most of the teams. While they were striving for mastery, the kind treatment of their masters seemed to urge them on to the task. These noble animals willingly and patiently put forth all their strength to gratify the curiosity of an admiring multitude.

"The anxious visages of the drivers, with their quick and seemingly agitated step, dictated to these discerning animals that something more than common was required of them to perform. They obeyed the dictate, and the work was done in silence without a goad or lash of the whip.

"This kind treatment to the docile and patient Ox, should be lauded and imitated; while the opposite treatment, which is too prevalent, should be derided and condemned.

"That man who will cruelly and wantonly goad, lash and beat this patient and useful animal, while bending his neck to the yoke, and freely spending his strength for the service and comfort of man, is the greatest brute of the two, and ought to be excluded the society of a civilized community. Public animadversion cannot be too severe upon such offences against humanity, and the feelings of a Christian people should prompt them to bring such offenders to justice, and to let them know that they are liable to punishment for such outrages against the laws of God and men."

The Committee on Heifers and Heifer Calves consisted of Alexander Dustin, of Sterling, Chairman; Jacob Conant of Sterling, Reuben Newhall of Spencer, Ebenezer White of Charlton, and Silas Brooks of Worcester. They reported that there were thirty five animals in the whole. They awarded to Col. John Whitney of Princeton, the first premium of \$8 for a three years old Heifer. To Dr. Oliver Fiske of Worcester, the first premium \$6 for his Heifer, half breed, two years and five months old. To Jacob W. Watson, Princeton, the 2nd premium of \$5. To Asa Rice of West Boylston, \$3. The twin Heifers of Maj. Daniel Tenney of Sutton, were said to be very fine. Heifers belonging to Mr. Simon Carpenter of Charlton, Capt. Ephraim Mower of Worcester, and His Excellency Levi Lincoln, the latter for exhibition only, were also commended as fine animals.

For yearling Heifers the first premium of \$5 to Mr. William Eager of Northborough. The second premium of \$4 to Mr. Asa Rice of West Boylston, and the third premium to Mr. Franklin M. Farnam of Charlton.

For Heifer Calves to Mr. Asa Rice of West Boylston, the first premium of \$5. To Mr. Samuel Chamberlain of Westborough the second premium of \$4. To Gen. Towne of Charlton, the third premium.

TEMPERANCE LAMP.

The right use of Alcohol seems to have been discovered at last. Hitherto its consumption has, with some, led to deeds of darkness; hereafter it is to be a means of universal light. The new lamps, in which the flame is fed by a mixture of alcohol and spirits of turpentine, gives a most brilliant blaze. The fluid is white and transparent, and has a beautiful appearance in glass vessels. The combustible compound is sold at 80 cents a gallon, and we understand that in the ratio of consumption it is as cheap, or cheaper than oil. We learn these new lamps are in considerable use in Baltimore, Philadelphia, and New-York, and that several hundreds of them are now nightly lit in Boston.—*Boston Patriot*.

POTATOES MANURED WITH PINE BOUGHS.

A farmer in New-Jersey relates to us the following experiment: Having a large number of young pine trees growing near his potato grounds, he gathered a sufficient quantity of the boughs to form a considerable covering to a row of potatoes which he was planting in drills. In the drill on one side of this he used lime for manure, and in the one on the other he put in marl. They were all covered with earth in the same manner, and received the same culture. On digging them, those that were manured with the pine were twice as large as the others, and double in quantity.

Planters in the Southern States estimate pine leaves, gathered early, as among the best of manures.

A MORSEL FOR ANTIQUARIANS.

In digging a cellar on the premises formerly occupied by Gov. Hutchinson, in North Square, in this city, there was found a keg containing 17 bomb shells, the largest 13 inches in circumference, and the smallest 9 inches. These articles were no doubt intended to aid the cause of Great Britain in our Revolutionary war; but by accident or design were suffered to remain both *passive* and *neutral* in the great contest for freedom.

ITEMS OF ECONOMY, USEFUL ARTS, &c.

Extraordinary Day's Work.—Slaughtered at the packing establishment of E. Wilson, Albany, on the 5th Nov. inst., 215 head of cattle. This was performed by fourteen butchers, who commenced work at half past 6 A. M., and ended at half past 4 P. M., and were absent 2 hours at meals; viz. —Bartholomew Powers, *Boss*; L. Grace, B. Vanetta, W. Butler, H. Young, H. Stackhouse, J. Christian, J. Grace, D. Kennedy, P. Sherdon, R. Crawford, P. O'Neil, F. Davidson, T. Burgess.—*Albany Argus*.

Alum as a Remedy for Cancer.—M. Gunoau de Mussey, speaks in terms of confidence, of the efficacy of alum in cancerous diseases. He has employed with advantage in cases of cancerous breasts, a solution of alum, with a little camphorated spirit.—*Jour. de Chim. Med.*

Preserving Potatoes.—Chance has led to the discovery of a method of preserving potatoes, which is both simple, and attended with little or no expense. A house keeper had placed in his cellar a quantity of charcoal. Having removed it in the autumn, without removing the dust that covered the ground, he caused a large quantity of potatoes to be laid on it. Towards the spring, those roots were preserved, had thrown out no shoots, and were as fresh and well flavored as ever.

A Profitable Farm.—A young and enterprising farmer in the town of Florida, N. Y., is said to have realised for three years in succession, from about 90 or 95 acres of land, a nett annual income of one thousand dollars. This seems mysterious and incredible to some of our Connecticut river agriculturists, but the secret about it is, he with the aid of a lad about 15 years of age, performed the principal part of the labor on the farm and did it well. Ruffle shirt farmers manage differently.—*Hartford Review*.

Large Library.—There are now, says the Philadelphia Sentinel, 43,000 volumes in the City Library of Philadelphia. Philadelphia, then, has the honor of possessing the largest library, (we do not know whether the best) in the United States, and for aught we know in America. That of Harvard University contains less than 40,000, and that of the Boston Athenæum about 30,000.

An Artificial Magnet has recently been constructed by Professor Henry, of Princeton College, which far surpasses in power every thing of the kind. A number of interesting experiments on the subject of electro magnetism, were exhibited by means of this wonderful instrument, in the presence of the students, and a large number of gentlemen assembled to attend the late commencement. Upon one trial it was found to be capable of raising between three and four thousand pounds; and we learn that with some further modifications of the apparatus, the magnet will probably be able to sustain upwards of four thousand pounds.—*Flem. Gaz.*

Ship Canal.—It is proposed in the New York papers, to make a ship canal of eight miles, around the Falls of Niagara. The project is said to be wholly feasible, and at comparatively little expense. Such a canal would, it is thought, secure to New York, the trade of Ontario.—*Philad. Intel.*

The Cotton Planters have made great exertions to bring their cotton early into market this year, and the forwardness of the season has enabled

them to do so. They have hurried their crops more rapidly into market than we have ever known. Last week the receipts were far beyond those of any week remembered before. This was sufficiently shown by the extraordinary arrivals on the two days we mentioned in our last paper; which, however, far exceeded the receipts on other days. The quantity brought in since has been considerably smaller. We think that this year, the whole crop will be brought in perhaps two months earlier than usual.—*Columbia Telescope*.

PRETTY WELL FOR BRUNSWICK PLAINS. Two pumpkins have been raised in this village, the present season, weighing forty-six pounds each. Another of our neighbors raised seven pumpkins from one seed; the largest, weighing 37½ pounds; the smallest, 22; the whole product of one seed was one hundred and seventy-two pounds.

Family Pioneer.

From the Mantius Repository.

THE CANADA THISTLE.

MR. EDITOR:—I have, for a long time past been hoping that some one who felt a deep interest in the subject, and who was capable of doing justice to its importance, would address the community, through the medium of public journals on the subject of the *Canada Thistle*.

I have anxiously waited to see some remedy suggested to arrest and lessen, if not wholly extirpate this terrible evil—but until very lately, I have not seen even a passing notice taken of the subject. More than three years since, I had prepared an article for the press, earnestly soliciting the attention of the community to this subject; but on consulting my neighbors and acquaintances, I found such an astonishing apathy in relation to it, such a total disregard of what I deem their essential interest, that, disappointed and dissatisfied, I consigned my article to the flames. I am rejoiced, to find some indications now, of a disposition to give it a consideration; and to have lately noticed in the *Genesee Farmer*, a proposal to farmers to give their sentiments and opinions on the subject. In pursuance of this suggestion, I here venture to contribute my mite, in the hope that I may possibly aid in arousing the attention of the agricultural community to such a consideration of the subject, as its importance demands, and as is obviously required by its influence on their interests.

That the *Canada Thistle* is an evil of the most alarming character to the comfort and the welfare of the farmer, no one acquainted with its history will for a moment deny. It is an evil in my view of immense magnitude—one that is daily, and most alarmingly increasing—and that will, I fear, ultimately, overrun the whole country, and almost ruin the value of our farms, unless the most vigorous and efficient measures are immediately taken to arrest its progress. I am astonished that farmers, generally, appear so little interested and alarmed on this subject, and am afraid they do not fully realize the nature and magnitude of the evil. During the few years that I have been acquainted with them, they have multiplied astonishingly on my ground. Ignorant at first, and unadvised, of their true character I spread them by the use of the plough and harrow, over large fields, and thus lost for grain tillage, some of my most valuable lands. The extent, also, to which they can be propagated by the seed is incredible; for in addition to the immense number of seeds produced by

a single plant, kind nature, to perpetuate its being, and enable it to fulfil the great command to increase and multiply, has furnished each seed with wings of down, which bear them on every passing breeze, and spread them far and wide, to remote and distant fields. With intense interest I have diligently sought for some remedy to eradicate them, but as yet I have found nothing that I consider sure and effectual. In cutting them down, I have, as advised, observed "times and seasons, and signs of the moon." I have put salt liberally on the young plants, and have mown down those that were in blossom, and put salt into the hollow stalks—but have never discovered that it destroyed them. There is probably no plant within the circle of our knowledge, so tenacious of life, and so difficult to destroy, as the *Canada Thistle*.

I know not the fact but consider it reasonable to conclude that by being often cut down, and never permitted to go to seed, almost any plant will ultimately decline and die away. I am inclined to think this the best remedy to arrest their progress. And to be most efficacious, the plant should be mown down when the root is most exhausted, and the juices most in the stalk, which is when the plant is in blossom. But in vain will a prudent, careful, vigilant person regularly cut down the thistles on his own plantation, if his neighbor is permitted to suffer beds of thistles to flourish and go to seed on his adjoining grounds. The cultivated fields of the prudent man, who to prevent their spread, regularly and seasonably cuts them down, may be even white with the down from the neglected thistle beds of his less careful neighbor; if there is not a *uniform* and *general* practice of mowing them down while in bloom. There is no possibility of consulting our safety, except by *uniformity* and *concert of action*—and no concert of action, on this subject, can be had, except induced by *legislative provision*. The object of this communication is, therefore, to endeavor to arouse the attention of farmers to this subject, and to urge them most earnestly to take into consideration the expediency of making application to the Legislature, at their session the approaching winter, for the passage of a law, forbidding any owner or occupant of land to suffer a bed of thistles to go to seed, under a suitable penalty. The Legislature of the State of Connecticut, I am informed, alarmed at the approach and spread of such an enemy, have passed a law on this subject, requiring every owner or occupant of land to prevent a plat or patch of *Canada thistles* from going to seed on his ground, or the road opposite his grounds, under the penalty of ten dollars, for each and every neglect. With such an enactment in this State, we could partly, if not wholly arrest the spread of this plant by the seeds. Every farmer can then with some courage and hope of success, resort to such measures to destroy those already on his grounds, as his own experience, and that of his neighbors may suggest as most advisable.

I most earnestly request editors throughout the country, who feel an interest in the prosperity and success of our agricultural pursuits, to press this subject on their patrons, to induce them to instruct their friends whom they may send to the State Legislature, to adopt the only measure, which in my view will be effectual to check this alarming and growing pestilence.

A FARMER.

Pompey, Onondaga Co., Oct. 3d, 1833.

From the American Farmer.
LODGING OF WHEAT.

An intelligent friend who called at our office a few days ago, communicated to us the result of an experiment made by him relative to the lodging of wheat.—He prepared two pieces of ground precisely similar in quality and aspect. On both of which he sowed wheat; on one he sowed *broadcast*; on the other in *rows*, which was thus effected: the land was ploughed as usual, but instead of harrowing it, he sowed the wheat immediately after ploughing; of course the seed fell naturally into the furrow, very little remaining on the ridges. After sowing, the field was harrowed, not crosswise, but in the same direction as it was ploughed. This last operation cast the seed almost entirely into the furrow at the same time covering it—and when the wheat came up, it stood close and thick in rows, almost as perfect as if planted in drills. This field of wheat succeeded perfectly and the grain remained erect, whilst that on the adjoining field, which had been sown broadcast, lodged.

The *rationale*, (as Loudon would say) of this, is as follows: In the field sown broadcast, the grain stands close and the circulation of air is prevented or at least impeded; the stalks, deprived of the influence of this element, remain soft and tender, are unable to support either themselves or the weight of the ears—and the wheat lodges. In the other case, the spaces, either vacant or but thinly covered, between the drills admit the air to circulate freely, by which the stalks become firm and hardened.

"The lodging or falling of some kinds of grain and of grass," says Nicholson, "is owing to their standing too thick to admit of a free circulation of air, by means of which only they can preserve a healthy state.—Plant one grain of wheat, for instance, in the richest soil, and the stalk when grown will not fall; but plant a great number of grains in the same soil, so closely together as to preclude a free circulation of air amongst the stalks and they become unable to sustain their own weight."

From the Manufacturer's and Farmer's Journal.

RHODE-ISLAND AGRICULTURAL, MECHANICAL AND CLASSICAL SCHOOL.

THE American Farmer, published at Baltimore, some time last summer, put forth the inquiry whether there was in this country, such an institution as an Agricultural School. Since that time we have endeavored to obtain information concerning the school under the direction of the Rhode-Island Agricultural Society. The most definite we have heretofore obtained was embodied in the account of that Society's annual Fair, which the American Farmer noticed and copied. We are now enabled to communicate some additional particulars concerning the system of labor and instruction which has been adopted in this novel and useful institution. The School, which commences its winter term on Monday, the 28th October, is now under the direction of Mr. Drury, as Principal, assisted in the English Department by Mr. Alden, a distinguished instructor from Northampton. The mechanical department will be under the superintendence of Mr. Alden, assisted by Mr. Reynolds and Mr. Partridge, both practical mechanics. The hours of labor will be from 2½ to 4½ o'clock in the afternoon of each day. The school hours are from 8 till 12 o'clock in the forenoon, and from one to half past two in the after-

noon, except on Saturdays, when they are from 8 to 12 only.

SALT YOUR CORN.

MR. BROWN, of this vicinity, communicated some information to us, in a conversation recently held with him, in regard to the use of salt in corn which is put away in the husks, which may be interesting to the public. He stated that he received last year a quantity of corn, which he had purchased, in so wet a state that he was apprehensive it would spoil. He remembered that it was a common practice in Pennsylvania, when hay was put away somewhat damp, or not fully cured, to sprinkle salt on it, and that such hay generally kept well, and that horses and cattle were very fond of it; he therefore concluded to try the experiment on his corn. He accordingly, as his corn was thrown in a pile on a large floor, sprinkled it with salt, using from a half a bushel to a bushel of salt to five or six hundred bushels of corn. The corn kept well, never became musty, and never had any weevil in it. Mr. B. still had of this corn when he communicated this information to us; and he stated that the bread which it then made was so sweet and good, that it was esteemed preferable to that made of new corn. He also stated that he was not under the necessity of purchasing any fodder for his working oxen last winter, they fed upon the husks of this corn so freely; and he added that they kept in excellent order. Mr. B. was so well pleased with this experiment, that he is putting up all his corn this year in the same manner, using about half a bushel of salt to five hundred bushels of corn, which he thinks is enough.—*Ala. Intel.*

From Goodsell's Farmer.

PITTING TURNIPS.

As the turnip harvest is approaching, we take the liberty of suggesting to those who cultivate the Swedes, our method for pitting them for winter. The pits are limited to two feet in width, and of an indefinite length, and are dug in a dry situation, seldom more than two feet deep. When the pit or hole is filled with roots as high as the surface of the ground, the turnips are laid by hand, the tops out, and sloping to the centre, until they terminate in a ridge which is generally about two feet above the ground. The whole are then covered with straw and then with earth. The important point follows: The crown of the ridge is then pierced with an iron bar, at intervals of a yard, and the earth pressed out so as to leave an entire aperture into the turnips, and into each of these apertures a wisp of twisted straw is loosely inserted. The roots will heat, and unless the rarefied air is permitted to escape the turnips are apt to rot. The openings permit its escape, without danger of the frost doing injury. With this precaution we have not lost one bushel in a thousand. The same course would no doubt be beneficial in preserving the *mangel wurzel*.

INDIA RUBBER BATHING TUBS

—Are manufactured in New York. The article folds up like a cot bed, and is so light that it may be carried in the hand from one apartment to another. Air beds, pillows, &c. are made out of the same material. Trunks are rendered water proof by being lined with a thin India Rubber cloth as thin as bank note paper. In England they have a method of restoring strength and elasticity to

rotten India rubber, and the substance has^{re} lately been brought into use for whale fishing line^{re}, and elastic cables and ropes, the superior excellence of which for many purposes is highly spoken of.

INDIA RUBBER.

MORE than fifty-two thousand lbs. of caoutchouc, or India rubber, were exported into England in 1830, being nearly double the quantity brought during the preceding year. Its price is from 1s 6d to 2s 3d per lb. The duty upon it is 5d per lb. The increase in the demand is to be attributed to the application of this substance as an article of general utility.

From the Rail Road Journal.

The following article will, we trust, be read with interest, by those who give their attention to the honey-making insect:

*A Parasite of the Honey Bee (Apis mellifica).—*For a few years past, many of those people, in this vicinity, who have apiaries, have found that in the month of April, May, and June, an unusual mortality had prevailed among their bees. This circumstance has led to a thorough investigation of the cause, by those who have felt a particular interest in the products of this valuable insect; and the result has proved that this mortality has been produced entirely by a parasite.

More than two years since, one of my neighbors suggested to me his conjecture, that there was a parasite fly that was injurious to the honey bee: since which time, we have fully ascertained the fact. I have a box now before me, containing a great number of bees, in which may be found the parasites, in both the pupa and the perfect state. Usually the bees become sickly and unable to fly, when the parasites are in the larva state; but they sometimes live till the perfect insect emerges from the pupa. The larva is fixed at the insculations of the dorsal segments of the abdomen of the bee, and is hardly discoverable by the eye, unless the abdomen be dissected. The larva is white, nearly two lines in length, and very much resembles a small worm or maggot. The pupa is nearly the size of the larva, and of a reddish brown color. The perfect insect is a non-descript, and bears very little resemblance to the [*Stylops*] or [*Xenos*] or any other insect, that has been found to be a parasite of the bee or wasp. It is of the class Diptera of Lin., is little larger than the Hessian fly, but in color and form it is very unlike that insect.

Kirby, many years since, discovered that the insect (*Stylops*) was a parasite in the black-bronze bee, (*Andrena nigroaenea*), in England, and Professor Peck afterwards found that the (*Xenos*) was a parasite in wasps, in America; but I am not aware that a parasite of the honey bee has ever been discovered till of late, and in this vicinity.

In conclusion, I would most sincerely request those who have apiaries to examine their hives during the spring and summer months, and if this parasite is discovered, to investigate the history of the insect, and if possible, to find a remedy for the injury it may produce. MARTIN FIELD.

Fayetteville, Vt. May 15, 1833.

Cherries. MR. PETER MYERS of Greenbush, has a tree full of ripe cherries of the second growth this season, having all the richness and flavor of a first crop.

LAWS

WHICH AUTHORISE TRAFFIC IN ARDENT SPIRIT AS A DRINK MORALLY WRONG.

(Continued from p. 133.)

So with all farmers and all merchants, and all other classes of men throughout the country: The traffic in ardent spirit is a curse to the whole community; a cancer on the vitals of all the sources of national wealth.

Even if the present profits of those who sell to unproductive consumers were more than those who sell only to productive consumers, as the property of their customers diminishes, and of course their ability to purchase, their future profits must be less. On the other hand, the ability of productive consumers, who replace what they consume with something of greater value, constantly increases; and of course their value as customers. They can purchase next year, not only as much as they have purchased this, but more; equal to the value of the addition which they have acquired, or a proportion of it. And thus what they consume becomes a source continually of increased reproduction, not only to them but to the nation.

On the other hand, what is consumed but not replaced by something of a greater, or an equal value, is ultimately lost—and is, to that amount, a loss to the country. Whatever causes an increase of unproductive consumption therefore, causes a decrease of national wealth. And this evil attaches in a high degree and to an enormous extent, to the traffic in ardent spirit. If the property which the consumers pay were burnt, all would acknowledge it to be a total loss; though the merchant and the distiller and the grain grower might all have received their pay. But it would in that case be a loss vastly less than it is now. It is now not only an entire loss, but it diminishes, as we have seen, beyond almost any thing else the sources and the power of future reproduction. It is therefore not only a source of great present loss, but also a prevention of vast future gain. It diminishes in both ways, the wealth of the nation, and to an amount, equal,

1. To the whole sum which consumers pay for ardent spirit; estimated by those who are best acquainted with the subject at about \$50,000,000 annually.

2. The loss of all the time which it occasions.

3. The diminished productiveness of land labor and capital.

4. The loss of health and reason; and all the expenditures which it occasions.

5. The cost of supporting the paupers, and prosecuting the criminals occasioned by it.

6. The property lost in consequence of it by casualties on the land and on the ocean.

7. The shortening of human life and the consequent loss of human labor: amounting in all, as all acquainted with the subject admit, to a sum much greater than the cost of the liquor. One hundred million dollars a year is a sum far less than is lost to the United States by this destructive traffic. And yet this, and the diminution of future gain which it occasions, would in one generation amount to a sum greater than the present value of all the real estate in the country. And this loss, to a great extent, is borne by those who are least able to bear it, the laboring classes of the community. It may not be amiss to advert for a moment to the beneficial uses to which this money might be applied; uses beneficial to the individuals, and to the nation. It would purchase

| | |
|--|--------------|
| 4,000,000 sheep at \$2.50 each, | \$10,000,000 |
| 400,000 head of cattle at \$25 each, | 10,000,000 |
| 200,000 cows at \$20 each, | 4,000,000 |
| 40,000 horses at \$100 each, | 4,000,000 |
| 500,000 suit of men's clothes at \$20, | 10,000,000 |
| 1,000,000 boys' do. at \$10, | 10,000,000 |
| 500,000 women's do. at \$10, | 5,000,000 |
| 1,000,000 girls' do. at \$3, | 3,000,000 |
| 1,200,000 barrels of flour at \$5, | 6,000,000 |

| 10,000,000 lbs. sugar at 10 cts. | 1,000,000 |
| 400,000 do. rice at 5 cts. | 200,000 |
| and 2,000,000 gallons of molasses at 40 cts. a gallon, | 800,000 |

| | |
|---|-------------|
| It would also build 1000 churches at \$5,000 each, | \$5,000,000 |
| support 2000 ministers of the gospel at \$500 each, | 1,000,000 |
| build 8,000 school houses, at \$500, | 4,000,000 |
| furnish 500,000 newspapers at \$2, | 1,000,000 |
| and establish 5,000 parish libraries at \$600 each, | 3,000,000 |

—and all in a single year. This might be repeated, from year to year, making in one generation of thirty years, thirty times the above amount.

Who then in our land need to be poor, or wretched? And what need to hinder this land, as soon as its population might wish, from becoming Immanuel's land; its peace flowing as a river, and its righteousness and blessings as the waves of the sea?

But the loss of property, great as it is, and enough to stamp the laws which authorise the business that occasions it with everlasting execration, is still among the least of its evils.

V. The traffic in ardent spirit as a drink impairs the health of the nation. Health depends on one great law; viz. The action of certain agents, upon their appropriate organs in the human body, which agents and organs, "the product of the Divine hand," are so perfectly adapted one to the other, that in view of all their consequences to endless being, their author himself pronounced them to be "very good;" perfect, good enough to satisfy the mind of Jehovah. Light, for instance, was made for the eye; air for the lungs; and food, nourishing food and drink, for the digestive organs; causing by their operations the functions of vision, respiration, nutrition, and the various movements on which health and life depend. But for what organ in the human body was ardent spirit made? There is none.

What organ in the human body needs its stimulus in order to perform in the most perfect manner, healthy action? There is none. What gland can extract from it the least portion of nutriment, or any thing which can contribute to health, or be in any way useful in the animal economy? There is none. The anatomist, the physiologist, the chemist and the physician examine with the minutest care every part throughout the whole body, and they can find none. God has made none, and there is none. Nor is there an organ whose healthy action is not disturbed by ardent spirit; and which does not instinctively reject it. The blood by its circulation conveys to each part of the body the materials of which it is composed, while each organ by its Creator is endowed with the power of selecting from the mass what it needs

for nourishment, and the performance of its appropriate functions, and of rejecting the refuse to be thrown out of the system. "The blood is therefore a sort of common carrier, conveying from part to part what is entrusted to it for the common benefit." When obliged to carry spirit, it presents it on its way, as it does other materials, to each organ; and each starts with mighty effort, not to welcome and receive, but to *repel* it. And if not crippled by the overpowering force of the enemy, it succeeds; and rejected, not suffered to stop, because it is worthless, the carrier, though vexed with its burden, is obliged to take it on to the next; rejected by that, it must carry it on, till rejected by all as a common nuisance, "it is seized upon by the emunctories, the scavengers of the system, and unceremoniously excluded." This is not for any want of kindness in the system towards friends, but because ardent spirit is an enemy, a mortal enemy. It would be treason to harbor it, and suicide to use it. Nature, through unerring laws stamped by the Divine hand, true to herself and her God, is incapable of such an offence; and till poisoned and perverted by the enemy, will never submit to it. On every organ it touches, spirit is a poison; and as such it is chased from organ to organ, marking its course with irregularity of action, and disturbance of function; exciting throughout the system a war of extermination, till the last remnant of the intruder is expelled from the territory. Till vital power is prostrated the enemy can never have a lodgment. And if, through decay of organic vigor, by the mighty force of the intruder, or the long continuance of the war, and by perpetual successions of new recruits, it cannot be expelled, the work of death is done; the last citadel of life surrenders, and the banner of universal ruin waves over all. Thousands of such conquests are made every year, and of territories more valuable than all the material wealth of creation. Before, the prospect was like Eden; and after, a land of sepulchres, with uncovered, putrid carcases of drunkards, sending up in clouds their poisonous exhalation, wafting contagion and death through the land.

To sanction by law the recruiting and equipping of such an enemy, and the sending of him out to desolate the fairest portion of God's heritage, is an outrage upon all principles, not only of patriotism, but of humanity, which bids defiance to parallel in the history of legislation. It is an outrage almost too gross for sober consultation. It would seem to be hardly possible, in view of its fruits, that it should be tolerated, we will not say in any christian, but in any civilized State. Even paganism, under the first rays of civilization, has almost instinctively denounced it. And were it not for the pestilential moral atmosphere which it produces, and the deteriorating and stupifying effects which that atmosphere occasions, its continuance would seem to be hardly possible; or its removal need any thing more than its own doings.

NEW USE OF FIRE ENGINES.

At the late fire in Troy, a number of fellows, after applying themselves freely to the common stock of rum, fell to fighting among themselves. One of the engines was standing near filled with water, and under the direction of a practical cold-water man, who suddenly extinguished the flames of war, by a single effusion from his pipe, and thus separated the belligerents.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 13, 1833.

PREPARATION OF FOOD FOR SWINE AND CATTLE.

It has been observed by an English writer on agriculture that an apparatus for steaming food for cattle should be considered as a necessary appendage to every arable and dairy farm, of a moderate size. It has been long known that many sorts of roots, and particularly the potato, become much more valuable by undergoing this sort of preparation. And it is equally well known that when thus prepared they have been employed alone as a substitute for hay, and with cut straw both for hay and corn, in the feeding of horses as well as other animals. To a farmer who keeps many horses or cattle, or even swine or poultry, the practice of boiling their food in steam is so great a saving and advantage, that it deserves the most particular attention. Though potatoes have often been given raw to both horses and cattle, they are found to be infinitely preferable, when cooked by steam, as they are thereby rendered much drier, and more nutritive. This has been long since shown by the experiments of Wakefield of Liverpool, who, in order to ascertain it, fed some of his horses on steamed, and some on raw potatoes, and soon found the horses on steamed potatoes had greatly the advantage, in every respect. Those on the steamed potatoes looked perfectly smooth and sleek, while the others were quite rough.

A description of a Root Steamer, with a cut, may be seen in the *N. E. Farmer*, vol. 6, page 23. One still more simple is that described in the "*Farmer's Assistant*" from which the remainder of this article is extracted.

STEAM-BOILER.

This is an implement that no Farmer or Planter should be without, as potatoes, particularly, are nearly doubled in value, for feeding and fattening, when boiled. Turnips and other roots, and pumpkins, are also much improved, as food for cattle, by a similar process.

Boiled clover-hay is found very good for keeping Swine, during Winter; and we are of opinion, that if fed to Milch-cows, during that season, it would greatly improve the quantity of their milk, and keep them in better order, than when fed dry to them. We believe this to be well worthy of a fair experiment, by having a vat, or box, to hold the hay sufficiently large for the purpose.

A steamboiler is commonly made by setting a kettle, holding twelve gallons or more, in a furnace, of brick or stone; and over this a hogshead, with one head taken out, and the other bored full of holes, is set so close that the steam of the kettle, when boiling, can only rise through the holes, and thence ascend among the articles to be boiled in the hogshead, and pass off at the top. In this way a hogshead full of potatoes will be nearly as soon boiled, as a small part of them only could have been, if placed in the kettle underneath.

As the kettle must be so closed as to prevent any steam passing off, but through the bottom of the hogshead or vat, a pipe or tube must be set in one side, through which, with the aid of a tunnel, the water is to be poured into the kettle, as often as occasion may require. When poured in, the tube is to be stopped, with a plug for the purpose.

Grain of all kinds may be steamboiled to great advantage, for feeding and fattening cattle; but, in

that case, it is requisite to have the bottom of the hogshead covered with a cloth, to prevent the grain running down through the holes.

By experiments which have been accurately made, in Pennsylvania, upon Indian corn and potatoes, used for fattening Swine, it was found that they increased in weight one third faster on the boiled, than on the unboiled food; or, in other words, they gained three pounds when fed on the former, where they only gained two pounds when fed on the latter. We are fully of opinion, that steam-boiling food, for feeding or fattening all sorts of cattle, generally increases the value of the food, as much as forty or fifty per cent.

We are induced to lay this down, as a general rule, that all kinds of food, whether for Man, or beast, is more or less improved in its nutrimental qualities, by being boiled. This is evidently the case, in regard either to grain or roots; and we believe that every kind of vegetable matter, even green grass itself, will be found much improved, as a food for cattle, when it has been sufficiently subjected to the operation of the steamboiler. But, whether the additional expense thus incurred, would, in all cases, be found overbalanced by the additional value thus given to the food, must depend on the results of experiments to be fairly and properly made.

RICE MILL AT SOUTH BOSTON.

This is an entire new invention, by some of our Yankee mechanics at Northampton in this State—STRONG, MOODY, & Co. It is remarkable that our Carolina friends, should be under obligations to us, for the best means of cleansing Cotton and also Rice. We are induced to say something on this subject, in consequence of a visit to these Mills which are just put in operation by JOHN PRINCE, Esq. who has purchased the exclusive privilege of using them in this section of the country.

They appear very effective Machines for doing the business of hulling and cleansing the Rice in a more perfect manner, than any heretofore known—As the method used in all countries is by *pounding*, which breaks much of the grain, and subjects it to become floury, and makes it very liable to insects in warm weather. The process of cleansing the inner coat is by *Carding* Machines in the shape of mill-stones.—And the other processes of bolting, brushing and winnowing clean and polish it in the most perfect manner, and make nearly the whole of it *head rice*—consequently we believe it will keep much better and be more valuable.

We know that in Summer it is very difficult to obtain good Rice, free from Weevil and other insects, being uncertain *how long* it has been *beat out*. Here we can go to the Mills and buy it from the *hopper*. We understand it is Mr. Prince's intention to grind some into fine flour, having a set of Burr Stones for that purpose.

This article more particularly since the appearance of the Cholera has become more in use than formerly—the physicians recommending it for general use, as a most wholesome food.

The machinery is in considerable variety, and appears ingenious and very perfect, is carried by a neat and powerful Steam Engine of 20 horse power, made by Mr. Holmes Hinckley, of Boston. A visit to this place, we think will gratify any persons desirous of seeing useful inventions. Mr.

Prince's present establishment is expected to clean 4 and 500 bushels of the rough rice or poddy per day—and can, if necessary, be much increased.

The outer coat or hull which is in large proportion, he expects will answer well for making *wrapping paper*—it is now under process for that object, and can be afforded at a very low price.

Figs in New England.—The Nantucket Inquirer says there is in one of the gardens of that Island, a flowering Fig tree, the fruit of which has come to maturity. The Hartford Times mentions another in that city, as heavily burthened with fruit, some of which has grown ripe, and proves very good. It would be rather singular if at this late day, New England should become the home of this fine fruit. This may not seem altogether improbable when we consider that it not only flourishes in Spain, which lies in the same latitude with our Middle States, but in France, which lies all north of the latitude of Boston. It is not native here, we grant; but that is true also of many other valuable trees and plants which have become acclimated here and elsewhere. In England scarce any thing is native but the oak. The vine itself was brought into France from the East, by the Romans; and so was the cherry tree. The olive, which now flourishes so universally, came from the neighborhood of Mount Taurus; and the Chinese, for a long time kept to themselves almost exclusively the orange, the lemon, and the white mulberry. The peach, which grows very well in Maine, is, we believe, of Persian origin. In a word, we cannot decide, without trying, whether New England, or the Middle States, may not cultivate the fig. We only know that cultivation will do a great deal which nature did not seem to intend accomplishing, without human instrumentality; and these results are the premiums she pays to the ingenuity and industry of man.—*Boston Journal*.

ITEMS OF INTELLIGENCE.

The Season.—A gentleman just returned from the west, states that on Thursday last he travelled on runners from Oswego to Auburn, and that the snow was from 8 to 10 inches deep. In some places on the route, apples were not gathered and potatoes were still in the ground.—*Albany Argus*.

Winer.—Snow fell at Bangor for the first time this season on the 30th ult. and we hear also that about one inch fell at Mariaville. The weather since then has been exceedingly cold,—and appearances at this time, give, is good reason to expect sleighing in a few days.—*Ellsworth Me. paper*.

Remarkable Case.—The Paris Academy of Medicine lately reported the case of a man who died in July last in that city, delirious, and in the right ventricle of whose heart was found imbedded a needle, which extended into the cavity. No trace of a cicatrix by which the needle might have entered, could be discovered on the exterior of the body. He had been suffering for some months from shivering and pain in the side.

The Greenfield Mercury states, that a gentleman belonging to Northfield, whose wife was in the steamer New England, and was injured by the explosion, has determined to commence an action against the proprietors of the boat for injuries sustained by her through the negligence of their agents. The action will be brought in the Circuit Court of the United States, at New Haven. This will afford an opportunity for obtaining the facts of the case.

Caution to Parents.—A child of Lewis Gordon of Portland, a little boy between two and three years old, lost his life a few days since by his clothes taking fire. His mother left it a few minutes to go into one of the neighbors, and on her return she met it at the door with its clothes on fire! it lived about twenty-eight hours.

Sheep.—The sale of Mr. Thomas Wright's flock of Merino sheep, in Chesterfield, last week, brought together a great number of people. The 200 sheep were sold for about 500 dollars, or \$2.50 each. Some brought over \$3.00, and some less than \$2.00.—*Hamp. Gaz.*

Quebec, Oct. 21.—The weather has been dry but cold. This morning there was ice fully half an inch thick, and the mud of the roads bore the carriages. The ground was sufficiently frozen to prevent potatoes from being conveniently raised in places at all moist. There are still some fields of oats out in a green state.

A decision of importance has been made in the State of Alabama, in regard to State jurisdiction over the Indians within its limits. A Cherokee Indian was indicted for murder, before the Circuit Court of the County of St. Clair, and when arraigned, his counsel filed a plea to the jurisdiction and maintained in support of the plea, two points:—1st. That the State of Alabama has no right to extend its jurisdiction over the Indian nations within its chartered limits—and 2d, conceding the right, the act of the legislature did not embrace the case under consideration.

The court sustained the plea, and discharged the prisoner, upon the grounds that Alabama had become a member of the Union with full knowledge of the treaties subsisting between the United States and the Cherokees, and that those treaties, having guaranteed the soil and jurisdiction to the Indians, the State had no right to either.—*Balt. Am.*

Bears.—From different parts of the country we continue to hear of the ravages of the Bears, who it seems have lately been so bold as to attack Oxen. We are informed that a short time ago, an Ox was killed at Le-preaux by a Bear, and last week, C. L. Hathaway, Esq. of Lancaster, had a pair of large oxen wounded—one severely and the other mortally by a Bear or Bears. We would earnestly recommend to people throughout the country to set log traps for these destructive beasts, some recommend a trap baited at night with a living sheep, which may be safely removed every morning; the bleating of the lone sheep induces the Bear to enter, and the trap springs before he reaches the bait.—*St. John City Gazette.*

Information which may be relied on has been received from the county of Saguenay on the subject of the harvest. In distant parts and elevated ground of the parishes of Baie St. Paul, Eboulemens, and Malbaie, the crops as early as the month of August, were all frozen and the inhabitants there, will be distressed as in 1816. In the low grounds, the crops, after great difficulty, have been partially saved, and the harvest is deficient by nearly a half. In the Ile-aux-Coudres, from the dryness of the soil, low situation, and exposure to the influence of the sea air, there will be a sufficient supply for consumption. The population of this country is about 10,000 souls.—*Quebec Gazette.*

WHITE MULBERRY TREES.

5000 Vigorous and large White Mulberry Trees for sale low—Apply to GEO. C. BARRETT, New-England Seed Store.

NEW ENGLAND FARMER ALMANAC FOR 1834.

JUST published and for sale by Geo. C. Barrett, No. 52 North Market street. The New England Farmer's Almanac, for 1834, by T. G. Fessenden, editor of the N. E. Farmer.—Astronomical calculation by R. T. Paine, Esq. Dealers supplied on liberal terms. oct 9

JOHN SCOTT'S LEGACY.

THE Board entrusted with the management of the fund bequeathed to the Corporation of Philadelphia, by the late John Scott of Edinburgh, "for distribution of premiums to ingenious men and women, who make useful inventions," hereby give notice, that in three months from this date they will award a premium to Adam Brooks of West Situate, Massachusetts, for an apparatus for—1. Reeling Silk from Cocoons: 2. Spinning or Twisting the Silk: 3. Doubling and Twisting it—all by one operation, provided satisfactory objections to the originality of said apparatus are not made in the meantime. The Members of the Board are.

JAMES MEASE,
ROBERT HARE,
JAMES DONALDSON,
WM. HEMBEL,
WM. PHILLIPS,

To any of whom application for premiums may be made. Philadelphia, Oct. 22, 1833. oc 23-d31g.

SITUATION WANTED,

BY an experienced Gardener; one who thoroughly understands the propagation of Green House Plants, Grape Vines, &c.—Good reference as to character and capability can be given. Apply at this office. tf oct9

WM. PRINCE & SONS,

—Deeming it unnecessary to have any Agent, request all orders to be sent to them direct per mail, and they will receive prompt attention, and be forwarded precisely as desired. Catalogues will be sent gratis to every applicant.

N. B. *Morus Multicaulis*, or Chinese Mulberry, \$25 per 100, and \$4 1-2 per dozen.

Limnan Botanic Garden and Nurseries,
Flushing, Oct. 8th, 1833. o 23

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug28

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK IN NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—Selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus Multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 230 varieties, including the *Paeonies*, *Moutan* and *Papaveras*—and 24 other kinds—and 33 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

WANTED.

HERDS GRASS, CLOVER, RED TOP. Of the growth of 1833 and of good quality.

ALSO—Flax and Hemp seed, for which cash will be paid. oct9

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sept 11 eow6w

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

BUCKTHORNS.

Buckthorns for Hedges for sale at \$3 per 100 for large ones, and small thorns in proportion, by G. C. BARRETT.

N. B. These are the genuine thorns, raised upon the farm of E. H. Derby, Esq. o 23

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

MISCELLANY.

HORTICULTURAL EXHIBITION.

Lines by Mrs. Balmanno, on the Horticultural Exhibition at Geneva, in September, 1833.

NATURE! how beautiful! ah, who may gaze

On these thy gorgeous treasures round him piled,
Nor with deep fervor their Creator praise,
Perfect in all his works—pure—undefiled.

What perfumes breathe—what colors meet the eye,
The Dahlia, gem-like, in its velvet fold;
Melon and Peach, with Grapes of Tyrian dye,
The ruby Nectarine and Quince of gold.

To grace imperial Autumn's golden reign,
The lovely Summer still her garland brings,
Wreathes his bright spoils with many a Woodbine chain,
And 'mongst his fruits, her faint sweet Roses flings.

Sunn'd in her smiles the Lily lifts its head,
The Alcea blooms—the Oleander towers—
Myrtles and Jasmines their rich perfumes shed,
And in pale radiance shine the Orange flowers.

Blended with Snowberries that gleam afar,
Like pearls, design'd some beauty's hair to braid,
The China-Aster's many-colored star,
In all its varied splendor stands display'd.

And like small jewels in a chaplet set,
Blooms, too, the bright Geranium and Sweet Pea—
Violets and Pansies—Daisies—Mignonette—
And the dark Pink's superb embroidery.

Nor these alone—but all that Autumn yields
Of grand or excellent in fruit and flower,
The stately growth of gardens, orchards, fields,
Tokens of Earth's full plenteousness and power.

In such a scene, O Nature! who may stand,
Nor feel his spirit swell adoring thee!
Who crown'd with blessings this, his native land,
The proud, the beautiful, the brave, the free.

OHIO!—*a little the biggest.*—The present season has abounded in choice fruit, and the papers have contained frequent notices of uncommonly fine specimens of different kinds. We have, however, neither seen nor heard of any thing equal to an apple shown us last week, which was brought by a gentleman from Ohio. It measured fifteen inches in circumference, and weighed at that time upwards of twenty-four ounces; and we are assured, when first plucked, its weight exceeded twenty-five ounces. It grew in the orchard of Heman Ely, Esq. of Elyria, Ohio, and was truly a noble specimen of Ohio husbandry.—*Con. Courant.*

LONGEVITY.

The widow Mary Wiggin, of Stratham, was born October 17, 1733.—She is still living, and has entered on the second century of her life, retaining in a good measure, her mental powers and bodily health. She is the oldest person in that town, and the first who has lived to the age of one hundred years. She has several grand children who are grand parents. Her maiden name was Jewett. Her first husband was Walter Weeks, Esq. of Greenland; her second and last, Andrew Wiggin, Esq. of Stratham. A gentleman of this town, who visited her three years ago, informs us that her memory was good, and her eye-sight so perfect as to enable her to read without spectacles. He has also seen her since her last birth day, and found her not materially altered, excepting that her senses of hearing is much impaired.

Exeter News Letter.

From the Temperance Recorder.
FARMING WITH RUM.

MEETING recently with a farmer residing in a neighboring town, I soon discovered from his conversation that he was a zealous advocate for the temperance reform, and he gave me many striking facts in regard to the good it had already effected among his acquaintance. To himself he said it had been every thing. He had in times past been a temperate drinker, and supposed it utterly impossible to accomplish the labor of his field without ardent spirit. For some years a barrel of whiskey was regularly purchased, and sufficed; but in process of time it was empty before the haying and harvesting were completed, and the two gallon jug went again and again to the merchant for a new supply. Unsuspicious of the cause, he found himself going behindhand yearly; every thing went wrong—his farm was mortgaged to the merchant—his blacksmith and other mechanics were unpaid—duns and demands came upon him frequent as April showers, but not half as pleasant; and with a rising family and increasing embarrassments, his prospects were most gloomy—poverty and wretchedness were before him. Daily his life became more and more unpleasant, and every effort he made to escape from his difficulties, only plunged him the deeper in trouble and perplexity. Still he saw not the cause. The leak which was sinking his ship so fast was undiscovered, and he saw no hope—no way of deliverance. How many thousands have like this man been involved, and from the same cause; and from affluence have sunk to abject poverty—sold their farms—gathered together their little all, and emigrated to the west!

FARMING WITHOUT RUM.

While our friend was in this perplexed situation, with nothing but ruin before his eyes, some person either by design or casually, sent him a Temperance Recorder. He threw it aside as being only suitable for the attention of *drunkards*, not suspecting that in that little messenger of mercy he should find a solution of all his difficulties and a sure way of escape. And so it is; man, wayward man, from ignorance and caprice, not unfrequently dashes from him the hand of kindness, and voluntarily shuts his ears and his heart to instruction. Our farmer, casting his eye upon the heading of one article in the Recorder, was induced from curiosity to read it through. Before he had finished, conviction of the inutility and evil of temperate drinking seized his mind, and without delay he determined to adopt the principle of *total abstinence*. All his domestic and farming arrangements underwent a change, and very soon the important discovery was made, that the barrel of whiskey had been the cause of his trouble. Of course it was discarded, and under the new order of things he soon discovered that laborers drinking only *cold water*, were of far greater profit than those who were stimulated by rum; the look of trouble and of fearful foreboding gave place to that of hope and cheerfulness; in two years his farm was disincumbered of the mortgage; every debt was paid; and he remarked, that which pleased him most was, that he could now do something in aid of the benevolent operations of the age. By this change, no one beside himself is a greater gainer than the merchant. True he sells him no whiskey, but then he sells him a much greater quantity of other articles than he before purchased;

and he sells them for cash too, for now our farmer wants no trust, though all are willing and desirous to see his name upon their books. L.

FRESH FALL GOODS.

ELIAB STONE BREWER, No. 414 Washington street, has received an extensive assortment of fresh Fall and Winter goods, which he offers, wholesale and retail, for cash only, considerably lower than can be bought in the city. Among which are 4 cases English, French and American cloths, consisting of superior, extra superior, middling and low priced, black, blue, mixed, and every variety of colors. 50 pieces Cassimeres, of all colors—2 cases pelisse cloths, an excellent article for chaise lining (very low)—1 case very nice Habit cloth, Brown, Blue, Claret, &c.—7 cases Satinets, Striped, and plain of various colors—5 cases 6-4 Eng. Merino, a very superior article, and all the most desirable colors, imported expressly for the subscriber—4 cases 8-4 Eng. do. of various colors and qualities—4 cases Circassians, very superior qualities and various colors—1 case superior Goats Hair Camblet—4 bales 4-4 5-4 and 6-4 Bocking, green and mixed—12 bales splendid Tarriffville Hearth rugs—5 bales Eng. low priced do. do.—54 bales Domets, white, yellow, red, &c.—10 bales Flannels, Eng. Welsh, and American—10 bales Cotton Carpeting, striped and blocked—6 bales Russia Diaper—1 bale Canton Flannel, lower than the cost of importation—3 bales American Cotton Flannels, bleached and unbleached—1 bale White Counterpanes, all sizes—10 bales superior London Row Blankets from 10-4 to 14-4—7 bales real Indigo Checks from 3-4 to 5-4—3 bales American Gingham—2 cases Eng. Gingham—29 bales cotton Batting—25 bales Pillisse Wadding, 12 bales black Wadding—5 cases Embossed Furniture Dimety—2 cases Embossed Cambric, for stage lining—20 cases Prints, all patterns and prices, Eng. French, and American—35 cases Bleached Cottons—50 bales unbleached cotton—10 bales Ticking 3-4, 7-8 and 4-4, some very superior quality—2 cases Sincaws—2 cases Saranets—2 cases Satin Levantines, superior quality—3 cases Levantines, low priced—7 cases Crape Dresses, all colors—5 cases Linens, Lawns, and Shirtings 4-4 to 10-4 with a very extensive assortment of Cambrics and Cambric Muslins, Bobbinette and Grecian lace, 4-4 and 6-4 Swiss nonsook, Book Jaconett plain and figured muslins—Hosiery and every variety of seasonable Dry Goods.

Country merchants will do well to call and examine for themselves. sept18.

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Coelebs, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. opt

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[F] No paper will be sent to a distance without payment being made in advance.

BOSTON, WEDNESDAY EVENING, NOVEMBER 20, 1833.

NO. 19.

COMMUNICATIONS.

PEARS.

We have frequently received letters from distant correspondents, respecting the best kind of fruit trees to be obtained in the vicinity of Boston, and at our request, Mr. W. Kenrick, of Newton, has furnished us with the communication subjoined. We hope soon to be favored with a descriptive catalogue of the best fruits in this neighborhood, from a Committee of the Mass. Horticultural Society.

For the New England Farmer.

THOS. G. FESSENDEN, Esq.—*Dear Sir,* I will send to-day my last years Catalogue, or that of 1833, and in a few days my new one, in which are marked with an asterisk all those varieties of Pears which have already been proved amongst us. All these are here of genuine kinds of course, as the tree, the leaf and the fruit, are compared with the descriptions, and the buds, to prevent even the possibility of mistake, are immediately renewed from the bearing tree: I will just speak here of a few which are there marked thus *.

g. 1. Bartlett (Williams Bon Chretien), large, fair, *very delicious*, first rate, always productive.

g. 2. Bourgmestre, very large and productive, a good pear.

g. 3. Capiaumont, 1st rate, very beautiful, large, delicious, very productive.

g. 4. Charles of Austria, large, beautiful, delicious fruit, bearing not yet known.

g. 5. Colmar Souverain, a noble and delicious fruit, bearing not known.

m. 6. Diel, is here genuine, a tree bore last year, its fruit of most superior quality.

g. 7. Beurre Easter, is here genuine from many sources; Mr. Manning's tree is now full for the first time—I saw it in August, shall see it again.

s. 8. Dix, a native of the 1st rate and very productive.

g. 9. Duchesse d'Angouleme. I have here from Messrs. Lowell and Perkins bearing trees. One of the most noble and delicious of all our Pears—very productive.

g. 10. Julienne, very productive, early and delicious, very early, bears early.

m. 11. Fulton, a native, very delicious and productive.

s. 12. Golden Beurre of Bilbao, new from Spain, very delicious, beautiful and productive.

g. 13. Harvard, a fine delicious native—tree a great bearer, but does not bear early.

m. 14. Heathcot, a large, delicious pear, very beautiful and productive.

g. 15. Passe Colmar, a most delicious fruit, and handsome, tree a prodigious bearer; St. Ghislain, of Van Mons, evidently a good bearer, a most superior fruit.

m. 16. Sylvanthe Verte d'hiver, a very first-rate late pear, a great bearer.

s. 17. Urbaniste, a very first-rate and delicious pear, a great bearer. This pear has been miscalled Beurre du Roi (of John Prince.)

m. 18. Wilkinson, a very fine native pear from R. I. very productive.

g. 19. Scotch Carnock, received from London Hort. Soc. proves a great bearer, a large winter fruit,

The above are some of the best kinds which are here from undisputed sources, from bearing trees. I add no more now. There are numbers of others I have marked.

I add one *beautiful pear* introduced by John Prince, Esq.; the tree grows remarkably and is a great bearer; the fruit tolerable for table, excellent for baking in Oct. This pear makes a fine show; it is 20th s. Dr. Hunt's Connecticut.

g. Denotes that the trees are now ready for sale of good size.

m. That the trees now ready are of middling size.

s. Trees small now, and I know not where else they can be got to depend on.

The size changes a little from the time we begin to take up in the fall, and is always diminishing till May.

Colmar d'hiver is here genuine; it bore fruit at Mr. Parsons's, but it cannot yet be recommended.

Forelle has borne fruit, genuine, but cannot yet be recommended.

D'Arenberg and many others, can only as yet be recommended for trial.

Very respectfully, your friend and obedient servant,

WILLIAM KENRICK.

Newton, Nov. 1833.

For the New England Farmer.

TOO MUCH TEMPERANCE.

MR. EDITOR, Has a man after receiving subscriptions and pay in advance for a public journal any moral right to devote it to other objects than those mentioned in his prospectus? If not, why are the pages of the "New England Farmer and Horticultural Journal" filled with the productions of the Temperance advocates? Why are the instructive essays, and extracts from books to which most of us have not access crowded out to give place to dissertations upon a subject which ought not to appear in its columns? I am no enemy to the temperance cause, but most cordially wish it success; by precept and example too, I show my devotion to it. There are papers whose object it is to diffuse information on this subject in their pages, and we are pleased to see any thing which will tend to enlighten the public mind and of course diminish the consumption of ardent spirits. "Every one to his trade" and "all things in their places" are our mottoes. We take the Farmer for the purpose of gaining information relative to our art, and to that let it be devoted; it is what we expect; what we have paid for; and it is what we claim. Injure not its usefulness, by prostituting its pages to any thing else.

A SUBSCRIBER who has paid in advance.

By the Editor. The above is a tolerable sample of the "Miseries" of Editors. We have, heretofore, been admonished of the propriety of *devoting more room in the N. E. Farmer to the objects of the Temperance Reformation*. We have been told verbally, as well as informed by letter, that nothing relating to *Rural Economy* is of half the consequence to individuals as well as to the community, as the inculcation of the doctrines of the advocates of total abstinence from distilled spirits, &c. &c. That more money, (to say nothing of health, reputation, mind, morals, &c.) may be saved by lessons

on this kind of *economy* than by all the recipes, agricultural axioms, horticultural essays, or rural prescriptions that ever were or ever will be diffused by means of the pen or the press.

Since then we are accused of publishing *less* than we should, as well as *more* than we ought on the topic aforesaid, we are inclined to think our course has not been very erratic. If, however, our correspondent can no longer endure our *sermonizing*, he will please to call at the *N. E. Farmer* office to receive the benediction; and we will direct our future discourses to more willing auditors. We will, however, inform him that we have about exhausted our temperance-topics, and shall not preach much more at present, unless by particular request, and to such persons as we think stand in particular need of our admonitions.

From the Albany Argus.

BERKSHIRE CATTLE SHOW.

I WAS among the many strangers who devoted two or three days to attend the recent anniversary of the Berkshire Agricultural Society. It was the *twenty-second anniversary*. As I had attended several of its meetings before, and one in the infancy of the society, my attention was particularly drawn to the evidences of improvement which had been developed by its influence. These were manifested in the highly improved appearance of the farms, farm stock, farm buildings and farm crops; but still more apparent in the moral and intellectual condition of the population. The interests of the society seemed to be identified with the interests of all classes; and all appeared to be solicitous for its prosperity and perpetuity, as though with the prosperity of their schools, (another subject of just pride) it redounded to their personal credit, and to the aggrandizement of their county.

Among the thousands assembled on the occasion, I beheld many of the reverend clergy, many other gentlemen of the learned professions, who are generally more or less engaged in husbandry, and merchants and manufacturers. Each class and each sex of society, appeared to be fully and well represented; all vied in giving interest and eclat to the occasion. The assemblage of ladies at the church, at the young ladies' fair, and at the ball room, was numerous and brilliant, and contributed in no small degree to diffuse a charm of good nature and kind feelings among the crowd. The exercises at the church were impressive and highly interesting. The dinner tables were surrounded by nearly two hundred persons, mostly husbandmen, highly respectable in their dress and their deportment. Hilarity presided at the festive board, regulated by the genius of temperance and the reverend clergy. I did not see a man, woman or child, who I thought had been intemperate in drinking or in eating. All seemed to be good-natured, cheerful and gay. On the whole, I was highly pleased and instructed, and became a full convert to the belief, that the society had more than realized the high expectations of its founders. I love old Berkshire, for her early and persevering efforts to improve the soil and to enlighten the mind—objects most worthy of our ambition, and most ennobling to our nature; and I rejoice,

most ardently rejoice, in the abundant rewards she is now realizing for these efforts—in the intelligence, industry and enterprise, in the prosperity and happiness of her sons and daughters. In the enjoyment of these blessings she is not surpassed by any. She has expended annually \$1200 (one half from the state treasury) in rewards for agricultural and household skill and industry; and this expenditure has been to her like seed sown in a good soil, yielding in return its fifty and its hundred fold. May her example yet have its influence upon the country around her.

From the New York Farmer.

QUANTITY OF INDIAN CORN TO THE ACRE.

Meadowbanks, Deerfield, Mass. Sept. 9, 1833.

MR. FLEET: Your New York Farmer for this month was received last evening, and I make no delay in replying to the inquiry of your correspondent E. The farmer to whom I referred whose crops of corn for the last ten years, have averaged more than one hundred bushels to the acre, is Earl Stimpson, Esq. of Galway, Saratoga co. N. Y. On a visit to his extraordinary and admirable establishment, in July of the last year, where every agricultural operation seems to be conducted in the most skilful and systematic manner, he gave me this assurance, as I find noted in my journal at the time; and I beg leave to inform your correspondent, that to any gentleman of agricultural taste and science, a visit to this farm cannot fail to yield instruction and great pleasure.

Mr. Stimpson's success, however, in the cultivation of this valuable crop is not singular. Examples of crops as abundant, are on record in your correspondent's own state; and to these, and to some others, as extraordinary, it may be useful and gratifying to refer. I ask leave, therefore, to mention a few, which have been submitted to the most careful examination, and the results established by the fullest proof.

John Stevens, of Hoboken, N. J. produced on one acre, 118 bushels, 2 quarts. "Mr. S. was confident that he would have had considerably more corn, had not his crop suffered very greatly by a thunder storm, which laid the greater part of it down at the time the ears were setting." On this crop a bet of fifty guineas was pending. The motives to exact measurement were such, therefore, as to secure accuracy. This was some years since; the particular date I am not able to ascertain.

Dr. Steele, of Saratoga, in giving an attested account of the crops of Earl Stimpson, in 1821, says that he had eight acres of Indian corn, which yielded 112 bushels to the acre, 896 bushels; 10 do. do. 90 bushels to the acre, 900 bushels. (Memoirs of New York Agricultural Society, vol. 2, page 73.)

The following individuals applied to the Agricultural Society in Washington county, Penn. in October, 1823, for premiums, with authenticated evidence of the quantity raised per acre, on not less than five acres; Joseph Evans, 136 bushels per acre—John Wolf, 127½ do. do.—Samuel Anderson, 123 bushels, 12 quarts do.—Isaac Vanhookens, 120 do. do.—Isaac Buckingham, 118 bushels 1 quart, do. do.—James Clakey, 113 do. do.—Jesse Cooper, 108 do. do.—De Gross Jennings, 120 do. do.

In the same year the following individuals applied to the Alleghany County Agricultural Society, for premiums on their crops: James Anderson of Ross township, 103 bushels, 17 quarts, on

one acre—John Snyder, of do. 103 per acre, on five acres—John Irwin of do. 105 bushels 20 qts. per acre, on 3½ acres—Wm. M'Clure, 129 bshls. per acre, on five acres. (Memoirs of Pennsylvania Agricultural Society, vol. 6, page 228.)

In 1821, J. & M. Pratt, of Easton, Madison co. N. Y. obtained from one acre, 172½ bushels—do. do. 161 do.—do. do. 161 do.

In 1824, the same gentleman obtained from 4 acres 680 bushels, or 170 to the acre.

From public and private testimony I know that the respectability of these gentlemen is such as to justify entire confidence in their statements; and their crops were subjected to the particular examination of committees for a premium. The Messrs. Pratt say they have no doubt of being able to obtain 200 bushels to an acre.

In 1823, Benj. Bartlett of Easton, Madison co. N. Y. obtained from one acre 174 bushels. The veracity of this gentleman is equally unquestioned; and his, too, was a premium crop.

In 1821, Benjamin Butler, of Oxford, Chenango co. N. Y. states that he raised on one acre, 130 bushels, at 60 lbs. per bushel. (New England Farmer for Nov. 1831.)

We will now come to some crops which have been produced in Massachusetts, on our cold, and rocky, and despised soil. The evidence of these crops is ample and of undoubted character.

In 1820, J. Hunnewell, of Newton, produced 111½ bushels to an acre.

In 1822, J. Valentine of Hopkinton, produced 116 bushels, 28 quarts, to an acre—D. Burnham, of Newbury, 117 bushels, 8 quarts do.—T. & H. Little, of do. 116 do.—P. Williams, of Fitchburg, 116 bushels, 12 quarts, do.—W. Hull, of Newton, at the rate of 118 bushels, on 7-8ths of an acre.

In 1823, Fitch Winchester, of Southboro', 103 bushels per acre—John Lees, of Newbury, 113 bushels, 16 quarts, do.—T. & H. Little of do. 115 bushels do.—Thaddeus Howard of West Bridgewater, 122 bushels, 23 qts. do.

In 1824, Wilmarth of Taunton, 142 bushels per acre.

1825, S. Longley, of Shirley, 112 bshls. 21 qts. per acre.

1827, John Andrew, Danvers, 110 bshls. per acre.

1831, Charles Bugbee, of Palmer, in Hampshire county, states that he has produced, on five acres, 540 bushels, or 108 bushels to the acre. (New England Farmer, for Nov. 1831.)

I might produce many other examples of crops approximating a hundred bushels, and some as large as those which are above referred to. The above are fully attested by the examination of committees; and are, in most cases, certified under oath, with the exception of the last, which rests upon the personal declaration of the gentleman named, whose integrity I have no reason to distrust, though I have not the pleasure of knowing him, excepting through the communication above referred to.

Another gentleman, whose name has escaped me, residing in Windsor, Berkshire co. Mass. on the very ridge of the Green Mountain range, in a spot whose aspect was particularly propitious, produced a few years since, 240 bushels of corn on two acres, lying in one piece, for which he received the premium of the Berkshire Agricultural Society. This, however, I state from recollection only, and not from any documents in my possession. I have, likewise, the assurance of his neighbors, who profess to know the facts.

In the communication to which your correspondent refers, I there stated, that Jesse Buel, Esq. President of the N. Y. Agricultural Society, rated his corn crop, from the measurement of a part of it, at 103 bushels to the acre; and deemed it practicable to obtain 154 bushels to the acre. The above measurements are all understood to be of ripe and shelled corn.

I am perfectly aware that these are extraordinary statements; but I have not a doubt of their correctness. I have not, myself, been able, with the best cultivation that I could apply, though I have never had a very favorable opportunity, to obtain nearly one hundred bushels; though, in one case, I gathered eighty-six from an acre; but I do not, on that account the less doubt that it has been done. I know, likewise, very well, the utter incredulity of many persons on this subject, who say, "they never can, and never will believe it possible to obtain one hundred bushels of Indian corn from an acre of ground." In such cases, I ask them if they would make such statements under oath, if they were not true; and if they did make them, whether they would not expect to be believed, or feel that they ought to be believed; and then, if they are not willing to render equal justice to others, or if they regard themselves as the only honest people in the world?

I consider the crop of Indian corn as of the highest importance to the country. There is, I believe no farm, in which an acre of ground can be made to yield so much of food for animal life, as by the produce of Indian corn; and no crop by which, where the soil is well managed, so much is returned to the ground to repair the exhaustion, to which the crop has subjected it. Rye and oats are very inferior crops, compared with it. Wheat is much more precarious; and with good cultivation we may reasonably calculate upon two bushels of corn to one of wheat. The superior value of corn fodder, where it is well saved, is, in many cases, a full equivalent for the extra expense of cultivation.

The average amount of this crop, even on the rich alluvions of the Connecticut, is, I apprehend, not more than forty bushels to the acre; and throughout the State of Massachusetts, it does not exceed thirty. It is my opinion, that not one fifth of the extent of land is devoted to this cultivation, which might be advantageously applied.—Many a farm of one and two hundred acres, has, perhaps, a patch of Indian corn of from four to six acres. This is nothing and scarcely deserves the name of farming.

The culture of this crop admits, certainly, of very important improvements. The great things which have been done, show us what may be done; and present the most emphatical encouragement to experiment and enterprise. I have seen fine crops of this vegetable growing in those parts of Jersey through which I have passed, and the soil seemed to me particularly favorable to its culture. Indian corn will bear to be cultivated longer in succession, on the same land, than almost any other crop; but its productiveness would be greatly favored by a judicious rotation. It is almost the only crop which cannot be too highly manured; and lands of a warm aspect, and which have a large proportion of siliceous sand, intermixed with loam, are peculiarly favorable to its growth. The durability of the grain is greatly in its favor; as, if well saved and housed, it may be kept in our climate for an indefinite period.

without injury or deterioration; and the farmer may always regard it as having a cash value. When pork is worth six cents per pound, corn may fairly be considered as worth from seventy to seventy-five cents per bushel, provided the animals to be fattened are of a healthy and thrifty kind, and the corn is applied in the best form and with proper economy. Its various important uses are too familiar to require remark. It is in truth to be considered as the gold dust of a country, where it is capable of being abundantly produced. Yours respectfully, HENRY COLMAN.

[From the Columbia Sentinel.]

PRACTICAL EFFECT OF SEASONABLE FARMING.

I HAVE heretofore enjoined the necessity of seasonable farming, because I have repeatedly compared the appearance of farms thus cultivated with others, perhaps naturally as good, but which by a different course of management—that is, when all the work was done late in the season, or in other words, not until the owners were driven to it—the difference made in every instance is so manifest, and so much in favor of the “go ahead” farmer, that I have often been astonished that the example of the latter was not always followed.—Reflections of this nature have occurred to every farmer of the least observation; and if there are some who yet *practise* delay in their work, I trust they will not also *advocate* it as the best method. It is not in one branch of agriculture alone that the effects of this kind of management have been observable; it extends through all the operations of the year, and uniformly results in this—while the one makes money, the other is gradually becoming poor. I now design to give a practical illustration of this rule, exactly as it has occurred in this vicinity, and as I mean to state simply *facts*, I trust no one will accuse me of exaggeration.

Within a few miles of my residence are two farmers, who each have a field of corn, and as I have often seen them at work in their respective lots during the season, I am enabled to state the method of cultivation pursued by each. First, the soil of both was that of our pine plain—a mixture of sand and gravel, but the largest proportion is sand. The two pieces were both sod, or land put down to grass; one had been in grass two years, the other longer, but in both, previous to ploughing, the grass was abundant and vigorous. If a choice had been offered me of either of the lots for a crop of corn, I would have selected the one which had been the longest in grass, not only on this account, but because I thought it more inclined to loom than the other lot. Now what I will call the best lot, for such I really conceived it to be, was ploughed late and with two horses. It then lay some time before planting, and the grass was beginning to sprout. It was now furrowed and planted. The corn as it came up had to encounter the grass, which had the start of it, and was permitted to grow some time, so that at the first hoeing the former was small and sickly. However, at a late day this operation was performed, and before the last of the field was finished, the grass in the part first hoed had become vigorous. The plough was after this occasionally used, but never until the shoots of grass were so numerous and as large as to interfere with the young sprouts of corn. This field has now come to maturity, and if the owner gathers fifteen bushels to the acre, it will be more than he has a right

to expect, and certainly as much as he can possibly gather from it.

We will now go to the other field, which has been subject to another kind of management, and see the difference in product.—The poorest lot as I call it, was not ploughed early, though in good season, with three stout horses. Immediately after the ploughing, the harrow was applied, and after that it was furrowed and planted. As soon as necessary the corn was ploughed and hoed; the plough was likewise used once or twice afterwards, and always in season, for the object was to keep the young plant clean of grass and weeds, and thus give it not only the entire surface of the ground for its growth, but the roots all the strength for their nourishment that the soil would afford. This field of corn having come to maturity, is a good though not a heavy crop. It will yield, I think, between forty and fifty bushels to the acre. Comparing the two fields together, therefore, the advantages is two thirds in favor of the seasonable farmer over his more tardy neighbor. Should I be asked which of these two farmers labored the hardest on his farm, I would answer promptly, the man who has the poorest piece of corn; because I notice he does all his work late, and is driven by it so that he is always in a hurry, whilst the other, taking “time by the forelock,” seems to have plenty of leisure and takes things easy. In circumstances they are much like their respective pieces of corn; and the disparity between them must become greater and greater, unless the one will imitate the example of the other.

Reader, I have not amused you with a fictitious story. I have stated only the naked truth, without a particle of exaggeration; and it is not necessary for you to visit these two fields of corn to corroborate what I have said. You have only to look around you, and by drawing a comparison you will see the difference between a field of corn or every other kind of grain on which the work has been done properly and in good season, and another where the labor has been performed not only out of season but in an improper manner.

A.

MASS. HORTICULTURAL SOCIETY.

SALEM, November 13, 1833.

To the Committee on the Cultivation of Ornamental Plants, &c.—GENTLEMEN, Permit me to introduce to your notice a new and distinct variety of the Indian Chrysanthemum. The just celebrity of numerous beautiful cultivated productions of this plant, will render, I trust, my remarks worthy your attention.

History. In the fall of 1831 a small lot of East India plants, via Macao, were received by Mr. John M. Ives of this town. Among them was this Chrysanthemum. An accompanying letter stated that it was lately introduced at Macao from Japan, and considered as new and rare: being only in the private collection of a gentleman. It was not till the autumn of 1832 that it displayed its flowers. By the generosity of its proprietor, it was soon *gratuitously* distributed; and one of the same plants, I am informed was this year exhibited in full flower, at Mr. Barrett's Seed-store and Agricultural Rooms, Boston.

Description. “Chrysanthemum sinense.” Lin. “Chrysanthemum Indicum?” Variety, “C. Bellidiflorum, daisy flowered Chrysanthemum,” Russell. Stem: suffruticose, branched—branches

spreading. Leaves: small, pinnatifid, slightly pubescent beneath. Flowers: peduncled, mostly in pairs; reddish brown; small. Peduncles furnished with slender bracts; pubescent, as are also the young branches. Calyx, imbricate, slightly scarious. Fertile florets, prominent, forming an elevated centre. Seeds—?

Observation. It is obvious that this pretty variety must recommend itself to cultivation, *remarkable* as it is for its dwarf stature and corymbose-mode of growth. The flowers too, are remarkably small, bearing no faint resemblance to “Bellis perennis,” or common “daisy,” from which I have ventured to give it a name. Should any farther inquiry be made concerning its history, &c. I can only refer to Mr. Ives, bookseller, Salem, who certainly deserves, at least, the sincere thanks of every lover of ornamental plants, for the care and liberality which he has displayed.

I remain, gentlemen, yours respectfully,
JOHN LEWIS RUSSELL,
Prof. Bot. & Veg. Physiol. Mass. Hort. Soc.

SALEM, 15th November, 1833.

To the Committee on Ornamental Plants, &c. of the Mass. Hort. Society—GENTLEMEN, I send you a plant of my new Japanese variety of the Chrysanthemum, described by Mr. J. L. Russell, and raised by Mr. Francis Putnam, who presents it (after exhibition) to the Society's Garden, at Mt. Auburn.

Respectfully yours, JOHN M. IVES.

The thanks of the Society were voted to the above named gentlemen.

EXHIBITION OF FLOWERS AT THE MASS. HORT. SOC. ROOMS.

Saturday, Nov. 16th, 1833.

CHARLES M. HOVEY, Cambridgeport, Chrysanthemums—Tasselled white, do. yellow, Quilled flame yellow, Golden lotus, Straw colored, Park's small yellow, Clustered pink or Tasselled lilac, Rosea, Buff or Orange, Brown purple, Straw purple, Ex. light purple, Curled lilac, Changeable lilac or Pink and white, 2 colored red, Mahogany colored, Paper white, Sup. clus. yellow, Superb large buff or pale buff, Early blush.

JOHN M. IVES, Salem, Chrysanthemum sinense.

By order of Committee, JONA. WINSHIP, Ch.

EXHIBITION OF FRUITS.

Apples. From Rev. Dr. Porter, Roxbury, fine specimen of the yellow Bellflower of Cox.

Mr. R. Manning, Salem, Epps's, or Danvers Winter Sweet, a good baking apple.

Mr. S. Downer, Dorchester, a fine apple (name lost.)

Mr. ———, Marlboro', a good Seedling apple.

Mrs. Crehore, Milton, a good Seedling apple.

Pears. Wm. E. Payne, Waltham, Bon Louise an excellent pear.

Mr. G. N. Fisher, Needham, Holland Green of Cox.

Mr. Rand, Newburyport, Winter Catherine, a good pear.

Mr. R. Manning, Holland Green of Cox, Bon Louise of Duhamel and the Winter Orange, desirable pears of the season.

Mr. J. P. Bradlee, from the Garden of Thos. Wigglesworth of this city, a fine specimen of the Beurre Gris, a pear of great excellence.

Mr. Samuel Downer, Dorchester, a fine specimen of the Beurre Diel, lot averaging 12½ oz.; this pear fully sustains the character given of it by pomologists.

Grapes. J. P. Bradlee, from Nantucket, Isabella grapes.

For the Committee, BENJ. V. FRENCH.

From the Providence Republican Herald.
GO TO WORK THE RIGHT WAY.
Addressed to Farmers.

I AM sorry there is so much need of the admonitions I am about to give. Depend upon it, you do not "*work it right*" or you would make your farms just twice as valuable as they now are.—Many of you *farm too much*. You would find it much more profitable to farm twenty acres, WELL, than forty by halves. The last season I made my grounds produce at the rate of one hundred bushels of Indian corn to the acre. Is this not much better than a common crop of thirty or forty bushels! You will certainly say it is, and with the same breath ask how I manage to make it produce so plentifully? My land being much infested with ground mice, or moles, and overrun with grubs and other vermin, I put on early in the month of March, about seven bushels of salt to the acre, which thoroughly destroys all kind of vermin, being an excellent strong manure, and ploughed and harrowed the ground over and over until it became completely mellow; I then had every corn hole filled with long manure, and after dropping my corn, (which had previously been soaked in warm water,) I scattered a pint of lime over every hill, and then covered the whole with a little mellow earth. In about a week the corn began to come up plentifully, after which I nursed it with the plough and hoe, every other week for eight weeks, at which time it was as high as my head, and not a spire of it was destroyed either by frost, grub, or birds. My other things I manured and equally well, and I have been amply paid for all my extra care and trouble, as I raised more than twice as much per acre as any of my neighbors, and did it in much less time. I mean I got all my harvesting done two or three weeks before many others. This is accomplished in a great measure by redeeming time; rising between three and four o'clock in the morning, then if the day be sultry and hot, I lie by from 12 to 3, and rest, I then feel refreshed and able to work till quite dark. This I call "*working it right*," whereas should I lay in bed until the sun be up and shame me, haunt the tavern at night, drink too much whiskey, but half manure, half plough, half plant, half nurse, half harvest, and do every thing by halves, I surely should not "*work it right*" nor get half a crop.

I shall now conclude by giving you, for further considerations, a few excellent observations, from a wiser head, perhaps than my own, and hope that every brother farmer will do likewise.

"I often say to myself, what a pity it is our farmers *do not work it right*. When I see a man turn his cattle into the road to run at large, and waste their manure during a winter's day, I say that man *does not work it right*. Ten loads of good manure, at least, is lost in a season, by this slovenly practice—and all for what? For nothing indeed but to ruin his farm.

So, when I see cattle late in the fall and early in the spring, rambling in a meadow or mowing field, pounding the soil and breaking the grass roots, I say to myself, this man *does not work it right*.

So, when I see a barn yard with a drain to it, I say this man *does not work it right*, for how easy it is to make a yard hollow, or lowest in the middle to receive the moisture and all the wash of the sides which will thus be kept dry for the cattle. The wash and moisture of the yard mixed with

any kind of earth, or putrid straw, is excellent manure, yet how much do not our farmers lose by neglecting these things, in fact they *do not work it right*.

When I see a farmer, often going to a retailer's store, with a bottle or jug, or lounging about a tavern or wrangling about politics, or quarrelling with and defaming his neighbor's good name, I am certain such a man *does not work it right*."

AN OLD FARMER.

From the Genesee Farmer.
SHEEP.

THE season has arrived for making calculations as to the quantity of sheep to be kept through the winter. There seems to be a great want of information among farmers, respecting the value of sheep sold to the butcher at this season. We have already heard of sales being made at 87½ cents per head.—Now the value of pelts in this market is one dollar thirty-seven and a half cents. Contracts for hams are made to large amounts, at two and a half cents per lb. and if we make an allowance of six pounds of tallow per sheep, on the average, we have, allowing the hams to weigh 10 lbs. two dollars, sixty-two and a half cents, leaving the fore quarters entirely out of the calculation. Do sales effected in this way divide the profits equally between the butcher and the farmer?

Now, as the season has arrived for making the proper selection of sheep, we would again express our opinion, that farmers would find it to their advantage to increase their number of long woolled sheep in this section of country.—The Dishley or New Leicester, says Loudon, "is distinguished from other long-woolled breeds, by their clean heads, straight, broad, flat backs, round barrel-like bodies, very fine, small bones, fine pelts, and an inclination to fat at an early age. The Dishley breed is not only superior, for its mutton being fat, but also for the fineness of the grain, and superior flavor, above all other long woolled sheep. The weight of the ewes, three or four years old, is from 18 to 26 lbs. per quarter, and of wethers two years old from 20 to 30 lbs. The wool, on an average, is from 6 to 8 pounds a fleece.

The Teeswater, Old Leicester and Devonshire, are all among the esteemed long woolled varieties, and we will give any information respecting the different breeds that may be desired.

From the New York Farmer.
SASSAFRAS TEA.

A WRITER in the Farmer's Register, after stating the difficulty which he has experienced in subduing sassafras bushes, gives the following account of the exportation of the roots:

Upon chewing the leaves, at any time from their most tender and succulent state, to their full maturity, they will be found full of mucilage, which, it seems likely, may be of use in medicine or the arts. It is well known that every part of the sassafras tree has a delightful smell and pleasant taste. The blossoms dried, and the bark of the root, make a tea which is so agreeable that I think nothing but the abundance and cheapness of the material has prevented its being generally used for this purpose. About twenty years ago, a trade in the roots of sassafras was commenced, by sending it from James river to England, where the use of the tea was extending among the lower classes. The roots commanded a good price, and the trade promised to be profitable to us; but the

jealousy of the East India Company (as it was said) caused this new trade to be quickly destroyed, by new and prohibitory duties on the article. During the few years that the exportation continued, the large roots of nearly all the sassafras trees in my neighborhood were dug up for that purpose; but as there was no difference of price offered, the roots of small shrubs, (though vastly superior in delicacy and strength of flavor,) were never used for sale, as they are much more troublesome to collect. If the purchasers had known the difference of value, a ton of small roots would have been sold for as much as twenty tons of whole stumps and large roots of trees, which formed nearly the whole amount of the commodity exported.

SILK MACHINE—COCOONS—SILK WORMS.

MR. ADAM BROOKS, in a letter to the Editor of the New-York Farmer, says, in speaking of his silk apparatus, "I do not reel it all before it is twisted into warp or filling, or doubled and twisted into sewing silk, or for other uses, of any size or twist that may be wanted—perfectly even, firm, smooth, and strong, as any that can be produced from any part of the world." His machines cost from \$20 to \$30. They can be had at the New-England Farmer office, Boston, and arrangements will probably be made to furnish them at the Agricultural Warehouse, 87 Washington street, New-York.

One thousand good cocoons will make one pound of wrought silk. The quality of cocoons is ascertained by their firmness—the thicker they are the better. Mr. B. gives three dollars per bushel. The least incision makes them useless for ordinary purposes. It would seem a safe calculation, therefore, that 2000 worms, well attended, would produce one pound of silk—1,000,000 worms, 500 pounds, — at \$5 per pound, \$2,500. When well reeled, it commands from 6 to 10 dollars per pound. The labor required to attend 1,000,000 worms would be, the first week, two persons; for the second, four; for the third, eight; for the remaining two, fifteen to twenty. Most of these persons may be boys, girls, or aged women. Mr. Smith, of Baltimore, estimates, from experience, that a full grown tree will feed 5,000 worms. But to guard against accidents, suppose it furnishes leaves for only 2,000, then 500 trees will be required. This number may be set out along the fences and about the dwelling, of almost every farm in the country; or the requisite quantity of leaves may be obtained from mulberry hedges. The requisite apartments for 1,000,000 of worms are equal to a room 40 by 80 feet. Considering the above facts, what farmer can hesitate to purchase mulberry plants this fall!—/b.

HITCH YOUR HORSES.

A CASE was tried last week, at Hartford, Conn. which it may not be unimportant for those who carelessly leave their horses unhitched in the street, to hear of. It appeared that two gentlemen got out of a gig, and went into a store, leaving their horse loose. The horse started, ran on the sidewalk, and against a person who was on it, threw him down and hurt him seriously, so much so, that he was compelled to keep his house all winter. He brought an action against the person who had the gig, and has recovered \$500. The principal point in the testimony was, as to the horse being hitched, and it being proved that he

was not, the jury gave exemplary damages.—*Poughkeepsie Telegraph.*

THE WAY TO MAKE A HORSE DROWN HIMSELF.

ONE of our most judicious farmers lost a valuable pair of horses last week in the Connecticut river. While working in the meadows, the horses were unloosed from the team and allowed to wander about, each one with his head fastened to his foot and then tied together. In this manner they went to the river, it is supposed to drink, and going into the river but a few steps brought their noses, which were tied closely to their feet, under the water. This occasioned strangulation, and in a short time they were found drowned in less than three feet of water!—*Northampton Courier.*

From the New-York Farmer.

TO PREVENT HORSES FROM BREAKING BRIDLES.

WE have heard farmers speak favorably of the following method of managing horses, recommended by the Farmer's Register:

While writing this letter, my attention was arrested by a person calling to another to run and prevent a horse from breaking his bridle, that he had just been tied by. I will, therefore, state how I broke a valuable mare from that habit a few years ago. I came home one day, and tied her, and had scarcely reached my door before she broke a new bridle into three parts, and ran off. I ordered her to be brought back, and after some reflection, I cut a piece of leather about four inches long, and about as wide as the head-stall, and drove two rows of small nails through; while this was fixing, I ordered a small pad to be made, about the size of the leather, and filled it with wool; I then pressed the points of the nails into the pad, and put the leather under the head-stall, and walked off. She gave a sudden jerk to clear herself from the bridle, which forced the nails through the pad into her head, after which she made one or two slight efforts, and stood still. I then took a horse-whip and gave her several cuts, but she would not break away: she appeared more afraid of the nails coming in contact with her head than she was of the whip. After this, when I tied her for two or three times, I slipped the pad and leather under the head-stall, which effectually broke her; and since, I have broke another in the same way. Both of these were young beginners; but I imagine that old offenders can be broken in the same way. This can be used to make a horse lead into a place, or pass a fence or ditch, which otherwise he would be unwilling to do.

LOW TRAINING OF GRAPES.

THERE appears to be very considerable concurrent testimony in favor of low training to prevent mildew; or rather, those grapes found growing very near the ground are found to be less liable to this malady. On the supposition that mildew is a parasitic plant, and that moisture is favorable to its germination and increase, the inquiry arises, are these low grapes less moistened by dews and rains than those that are higher? In ordinary seasons we think they are. They are protected from dews, mists, and light rains, by the over-incumbent leaves and branches. Although they are not as early dried by the rays of the morning sun, yet the moisture is more gradually evaporated, and they receive more radiated heat from the earth. After all, the vine culture, particularly the exotic, is in its infancy in our country.—*Id.*

CHINESE MULBERRY—*Morus Multicaulis.*

THIS plant, independent of its great value for the feeding of silk worms, is very much admired as an ornamental tree. The large and silky appearance of its foliage affords a pleasant contrast with that of most other trees. In the vicinity of Boston, there are, we understand, quite a number of considerable size. They are of very luxuriant growth, and propagated with much ease and with great multiplicity. As far as experiments have been made they are equal, if not superior, to the white mulberry, in the quantity and quality of the cocoons; and in abundance of foliage they are, decidedly, preferable. They are now so cheap that every farmer can afford to buy a few.—*Id.*

BAYBERRY BARK.

THE bark of the root of the Bayberry bush, which grows so plentifully in the woods and waste fields of this County, has become of late, quite an article of traffic. We learn that it is used at the manufactories for the purpose of dyeing. In the town of Harwich, we are informed that a great quantity of this bark, (perhaps 30 tons) has been collected during the past season by the women and children, who obtain at the stores three cents per pound for it. It is sent to Taunton, Fall River and other manufacturing places, where it is sold for 12½ cents, and in some instances, much higher. It is also used for medicinal purposes.—This Bark if easily obtained; the bushes grow in a light soil, the roots near the surface; they are pulled up with little strength and dried, and then the bark flies off with a gentle pounding. We believe this is the greatest benefit this county has ever received from the 'American System.'—*Barnstable Patriot.*

ONIONS, &c.

THE Barnstable Patriot, speaking of the quantity of Onions raised in that place, observes:—"We have heretofore said something about the quantity of Onions raised in this town the present year. We now say from pretty good authority, that the whole number of bunches raised will not vary but a trifle from one hundred and thirty-five thousand."

"IF YOU HAVE TEARS PREPARE TO SHED THEM NOW."—We have been shown an onion 15½ inches in circumference, 5 1-3 inches in diameter, and weighing 1 lb. 10 oz. which was raised in a garden at Garrison Hill in this town. A Pumpkin weighing 50 lbs. also grew in the same garden. If this was not "exactly" a large pumpkin, it is "pretty considerable" of an article for Thanksgiving.—*Dever Inquirer.*

MORE TEARS.—Mr. John Whitecomb, of this town, brought into our village last week, three bushels of Onions, grown in his garden,—one bushel counted 65 only—the other two eighty each, they were measured without being culled the larger from the smaller,—many of them weighed 20 oz. each. In Onions and Wheat, (the latter raised by Esq. Williams, 55½ bushels to the acre,) Fitchburg challenges a rival.—*Fitchburg Gazette.*

A WYCH ELM,

—IN Sir Wm. Baggott's Park, in the county of Staffordshire, as Sir Henry Capell told me, employed two men five days to fell it. It lay forty yards in length, the stool was five yards two feet across, fourteen loads of wood brake in the fall, forty-eight loads in the top, eighty pair of naves were made of it, besides eight thousand six hundred and sixty feet of boards and planks. It cost

£10 17s. in sawing, and the whole was conceived to weigh ninety-nine tons. It was felled in 1674.—*Horticultural Register.*

USEFUL TO FARMERS.

THE following table shows the number of plants contained in an acre, planted at the several distances specified in the columns marked "feet apart." For example, an acre will contain 10,890 corn hills two feet apart; 2,151 four and a half apart, &c. These numbers are obtained by dividing 43,560, the number of square feet to an acre, by the square of the number of feet the plants are distant from each other; thus—the square of 2 is 4, and 43,560 divided by 4 gives 10,890, as above. If the plants be set in an oblong form, as five feet by six apart, multiply the two distances together, and divide 43,560 by their product, for the answer. When setting out trees, farmers generally name the distance in yards. In this case, divide 4840, the square yards in an acre, by the square of distances apart, if they be equal, or by their product if they be unequal, and the quotient will be the number of trees in an acre. For example: at 7 yards apart, an acre contains 98 trees; for the square of 7 is 49, and 4840 divided by 49 gives 98, the nearest whole number. If the distances be 7 and 10, their product is 70, and 4840 divided by 70 gives 69 trees:

| Feet apart | No. plants | Feet apart | No. plants | Feet apart | No. plants | Feet apart | No. plants |
|------------|------------|------------|------------|------------|------------|------------|------------|
| 1 | 43560 | 1½ | 19360 | 2 | 10890 | 2½ | 6969 |
| 3 | 4840 | 3½ | 3556 | 4 | 2722 | 4½ | 2151 |
| 5 | 1742 | 5½ | 1440 | 6 | 1210 | 6½ | 1031 |
| 7 | 889 | 7½ | 774 | 8 | 680 | 8½ | 602 |
| 9 | 537 | 9½ | 482 | 10 | 435 | 10½ | 395 |
| 11 | 860 | 12 | 302 | 13 | 257 | 14 | 222 |
| 15 | 193 | 16 | 170 | 17 | 150 | 18 | 134 |
| 19 | 120 | 20 | 108 | 25 | 69 | 30 | 48 |
| 35 | 35 | 40 | 27. | | | | |

[*Newbern Spectator.*]

APPLE AND CABBAGE SEED.

IT is said, that if the largest pip in an apple be sown, the fruit will be similar to that of the parent tree, without grafting; and that the cabbage seed gathered from the middle flower stem produces plants which will be fit for use a fortnight earlier than those from the seed of the lateral flower stems.—*Horticultural Register.*

YANKEE INGENUITY.

SOME weeks ago, we spoke of a Yankee corn-grinder lately invented which increased the corn in quantity as well as in nutritive power;—a statement, which aroused the criticism and amusement of our friends, among whom was the editor of the Transcript,—but it is true nevertheless,—as many witnesses are ready to vouch. Now we have another Yankee invention to speak of. We saw on Saturday at a chaise manufactory in this town, a piece of a board, or rather a slice of bass wood, which was sawed off by a saw lately invented by Mr. Job White, an ingenious mechanic in Belfast,—which machine, as we are informed, is so constructed as to saw circularly, or in other language unrolls a log in one piece, as a piece of cloth. This saw works horizontally—and the board is rolled off on a cylinder. Its chief utility, we suppose to be in the ability to make a wide board out of a small log. The Pannels, &c. are thus sold much cheaper. The boards, we presume, can be of any thickness.—*Portland Ad.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 20, 1833.

POTATOES FOOD FOR HORSES.

An Irish writer on husbandry, whose name is Martin Doyle, and whose works were published in Dublin in 1830, has the following remarks:

With respect to potato-feeding for horses, I recommend it from an experience of some years. My horses are old (one of them at least 20 years of age), but they are in high spirits and condition from having every evening after work, excepting during the soiling months [when grass, &c. was cut and carried to them], an abundant supply of boiled potatoes (warm) regularly given to them; but as the authority of T. C. Curwen, Esq. M. P. of Workington Hall, Cumberland, is infinitely more valuable than mine on this subject; I shall quote the following passages from his "Agricultural Hints."

"It requires from 5 to 6 hours for a horse to masticate a stone [14 lbs.] of hay, while he will eat a stone of potatoes in 20 minutes or less. The saving of 4 hours for rest, is alone sufficient to produce the greatest difference in the health and condition of the animal. After great fatigue also a horse would be tempted to take warm food when he would not eat hay. I have at this time in my works horses, which were purchased six years ago of a farmer, who was selling off his stock as worn out, and of little value, and which are yet able to do their work with the best horses I have. I think there is little doubt of the life of this valuable animal being considerably prolonged by this mode of feeding—I have begun to mix an equal quantity of cut straw and potatoes; racks are, according to this mode of feeding as unnecessary as they are productive of waste, for to save trouble they are always filled; and what is not eaten is always so tainted with the breath of the animal as to be wasted." Probably steamed mangold wurtzel and other roots would be valuable as food for horses.

LITTER

—For your barn yards, stables, styes, cow houses, &c. may well be gathered from fallen leaves; and the mould made by the decay of leaves will also be valuable in your yards, &c. as a receptacle for the liquid manure which would otherwise soak into the ground, enrich the highway, or be lost in a neighboring stream.

WINTER

—SENT his card some time ago, but delays his actual visitation in order that we the Farmers, Housekeepers and Barnholders, may be the better prepared to wait on his worship. Now, although he is rough as a royster, and rude as a raggamuffin, it will be expedient, nevertheless, to give him a warm if not a welcome reception. You will, therefore, make not only your house but every habitation for man and beast in and about your premises, "too hot to hold him."

And when he comes from desert howling
And swamps scarce fit to pasture owl in,
Leave not a crack to let him in
In which you could insert a pin;
Let flocks and herds no shelter lack
Against his merciless attack;
For pinch'd with cold and half alive
The richest food wont make them thrive,
But they will be just fit anon
To starve a flock of crows upon.

But jingling apart; unless your animals are made comfortable, your fodder will be wasted; therefore sell what you cannot well keep, and what you do keep, keep well.

ANOTHER LARGE BEET.

MR. D. BLAKE of Wrentham, has left in the Office of the New England Farmer a Beet of the kind called Sugar Beet, which weighs without the top 18 lbs.

WHITE PINE.

THIS tree, which constitutes the uncoined bulion and much of the present wealth of this part of the country, is the loftiest tree in the United States. It attains sometimes the height of 150 feet, or even more, with a trunk five feet and upwards in diameter. Its foliage is evergreen, light, delicate, and making an elegant appearance.—It is found most abundant between the forty seventh and forty third parallels of latitude, along the Alleghanies to their southwestern termination, and in its greatest glory west of the Rocky mountains, on the river Oregon. On the head waters of the Allegany is cut all the pine destined to supply not only the towns along the Ohio, but also the New Orleans market, 3000 miles distant. On the head waters of the Delaware are large forests of white pine, which are floated in spring down the waters of that river, and the West branch of the Susquehannah, for the supply of the cities and towns in that quarter. The shores of lake Champlain, and the banks of the rivers flowing into it, abound in this kind of pine, which is partly floated down the St. Lawrence to Quebec, and partly through the northern canal to Albany whence it is distributed down the Hudson. But Maine furnishes about three fourths of all the white pine lumber exported from the United States, and the Penobscot river is the centre of this trade, and hereafter must furnish the main supply in the Lumber market. Throughout the Northern States, about three fourths of all the houses are built chiefly of this material, and the ornamental work of nearly all the rest is composed of it. For masts and spars its use is almost universal throughout the middle and northern States; and owing to its lightness, its loss could not be supplied without considerable difficulty. The Rigamasts are said to have more strength; but the English derive most of those in the merchant service, and yards and bowsprits for the Navy, from New Brunswick and Canada. As the sources of supply are annually drying up, and the demand is constantly increasing, the pine timber lands of our State are becoming invaluable.—*Bangor Rep.*

ITEMS OF INTELLIGENCE.

A surprising phenomenon occurred on the 12th inst. From about midnight till day-break the sky seemed filled with a countless multitude of meteors, or shooting stars, which diverged in every direction from a point near the zenith, resembling a shower of fire. The sky was clear, and the scene magnificent beyond any thing of the kind ever witnessed except in the polar regions, where similar appearances are said not to be uncommon.

One of our correspondents, experienced in the cultivation of Grape Vines, says the N. Y. Journal of Commerce, advises that they be pruned in all this month, selecting a mild day for the operation. If the Vines are left until the Spring they are subject to bleeding.

We are authorized to state, that at the request of the President and Directors of the Connecticut River Steam-

Boat Company, a number of scientific and practical gentlemen met at Essex, on the 8th instant, and under the direction of Professor Silliman, went into a full and thorough investigation of the causes which led to the recent disaster on board the New England. We understand their report will soon be laid before the public.—*Conn. Courant.*

From Mexico. An arrival at New-Orleans, from Vera Cruz, brings advices from that port to October 12th and from the city of Mexico to the 5th. An express arrived at Vera Cruz on the 12th, with intelligence that a general engagement had taken place between St. Anna and the rebel troops, in which the latter were totally defeated. Duran escaped to the mountains with his cavalry, and Arista retreated to Guanajuato with the remnant of his troops. St. Anna had possession of the main entrance to the latter city, and a deputation had come out with propositions to surrender the place to prevent its being taken by storm.

Hop Culture. The Bangor Courier mentions that one of the packets of that place, bound for this city, recently took on board 200 bales of No. 1 Hops raised in Penobscot. The value of this quantity is \$8,000, and the present prices of the article make the crop worth, on an average, \$150 per acre. As the Maine soil and climate are suited to the culture, we see no reason why it should not be carried, in that as well as other sections, much farther than it has been. In Great Britain, about 50,000 acres are occupied with hops.—*Bost. Pat.*

Mad Foxes. We are informed by a gentleman from the town of Hunter, that mad foxes have become very numerous and troublesome in that town. They have bitten many cattle, sheep and several dogs, some of which have since become rabid. In one section of the town they are said to be so plenty that the inhabitants dare not venture out without being armed.—*Cattskill Messenger.*

President Jackson has presented to Princeton College, for its museum, a collection of insects from South America, which is spoken of as being very valuable, and as adding, considerably, to the interest of the entomological department.

A late number of the London Courier, contains the following extract of a letter from America:—"I am travelling in Vermont for pleasure and information. I have journeyed 500 miles in my own carriage, by easy stages, and have not seen a single person in my progress to whom I should have dared to offer alms! As I was detained an hour or two a few days since, I saw a sturdy looking farmer pass the inn driving a one horse cart, loaded with wool, on which he was seated. He drove to a store, shouldered his bales of wool, one after another and placed them in a merchant's shop.—Who do you think he was? Palmer, the present Governor of the State of Vermont!"

Law of the Road. At Salem, last week, at a term of the Supreme Court, a case was tried, the plaintiff having sued for damages, occasioned by running a loaded wagon against the chaise of the plaintiff, causing the breaking of the shafts and other injury to the chaise, and to his person, while riding from Boston with two ladies. The accident happened near the farm of Mr. Dodge, on the Lynn Road, near a sharp bend, and was caused by the hind wheel of the wagon, catching the wheel of the chaise. The defendant failing to prove that there was any just impediment to his turning out and giving the proper share of the road to the other party, the jury found for the plaintiff \$47 damages. In the charge to the jury the court remarked, that the law presumed the party to take the right and to drive in the mode prescribed by the statute; and the burden of proof is on him to show an impediment. That, where there is no

object in sight, he can take either the left or right. As it was proved to the satisfaction of the jury, that there was no obstacle sufficient to prevent his turning out, and that he had time enough to do so, after he first saw the approaching chaise, the defendant was held liable.

SUPERIOR STOCK AT AUCTION.

At the Farm of Henry Watson, at East Windsor, will be sold on Friday the 22d day of November, all the Stock on said farm, consisting of one of the *finest* flocks of Saxon and Merino Sheep, in the State; improved Durham short horned cattle and fine horses. Among which are,—

Winter Arabian, a celebrated Arabian Horse, ship'd from Africa and intended as a present to the late King of England.

Donna Maria, a bay Filly, 3 years old, by the imported horse, *Romero*.

Lady Litchfield, a Sorrel Mare, 7 years old, by Roman.

Mias, a bay Filly 1 year old, dam Lady Litchfield, one good work-mare 8 years old, and one good Team-horse about 10 years old.

Flora Hills, a thorough bred Ayrshire cow, 6 years old.

Red Rose, 5 years old by Wye Comet, dam by Denton.

Fairy, 3 years old, by Wye Comet, dam an Ayrshire cow.

Nelly, 3 years old by Wye Comet, dam by Holderness, g. d. by Denton.

Susan, 3 years old, by Wye Comet, dam by Holderness.

Laura, 2 years old, by Wye Comet, dam by Wye Comet, g. d. by Denton.

Ann, 2 years old, by Wye Comet, dam a full blood Dutch cow.

Juba, Bull 1 year old, by Brougham, dam Flora Hills.

Hector, Bull 1 year old, by Brougham, dam by Wye Comet, g. d. by Holderness, g. d. by Denton.

Heifer Calf, by Patriot, dam Flora Hills.

Heifer Calf, by Patriot, dam Nelly.

Heifer Calf, by Patriot, dam half blood Ayrshire cow.

Heifer Calf, dam Ann.

2 yoke of Oxen.

1 yoke of Steers, 2 years old.

4 Saxon Rams.

4 do. Ram Lambs.

175 Saxon and Merino Ewes.

40 do. do. Wethers.

40 do. do. Ewe and Wether Lambs.

2 Dishley Rams.

2 do. Ewes.

Sale positive, and to commence at 10 o'clock, A. M.

B. HUDSON & Co. Auctioneers.

East-Windsor, Nov. 12th, 1833.

HAY, STOCK, &c., AT AUCTION.

Inquire at this Office. 21 nov 20.

SEED OF THE TRUE COCKSPUR THORN.

Being the same as the Hedge of J. Prince, Esq., Jamaica Plain, as yet perfectly free from all insects, and an elegant Hedge—15 years old. One dollar per quart. n20

JOHN SCOTT'S LEGACY.

THE Board entrusted with the management of the fund bequeathed to the Corporation of Philadelphia, by the late John Scott of Edinburgh, "for distribution of premiums to ingenious men and women, who make useful inventions," hereby give notice, that in three months from this date they will award a premium to Adam Brooks of West Scituate, Massachusetts, for an apparatus for—1. Reeling Silk from Cocoons: 2. Spinning or Twisting the Silk: 3. Doubling and Twisting it—all by one operation, provided satisfactory objections to the originality of said apparatus are not made in the meantime. The Members of the Board are,

JAMES MEASE,
ROBERT HARE,
JAMES DONALDSON,
WM. HEMBEL,
WM. PHILLIPS.

To any of whom application for premiums may be made, Philadelphia, Oct. 22, 1833. oc 23-43g.

NEW ENGLAND SEED STORE, AND HORTICULTURAL REPOSITORY.

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS, upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country: these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

N. E. Seed Store, connected with the N. E. Farmer Office, No. 51 & 52 North Market-str. GEORGE C. BARRETT, oct 16

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 230 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

BRIGHTON MARKET.—MONDAY, NOV. 18, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 3100 Beef Cattle, 250 Stores, 5440 Sheep, and 260 Swine.

PRICES. Beef Cattle.—Sales were quick and prices have advanced. Cattle generally were not so good as they were last week, consequently the highest price was not obtained. We quote prime at 5 and 5 50; good at 4 50 a 5 50.

Barrelling Cattle.—Mess 3 12 a 4 25; No. 1, 3 62 a 3 75; No. 2, 3 25 a 3 50.

Sheep.—Sales were heavy and prices rather declined. We noticed lots taken at 31 33, 1 50, 1 67, 1 75, 2 00, 2 08, 2 37, and 2 42. Wethers at 1 88, 2 25, 2 37, 2 75, 3 a 3 12.

Swine.—In good demand; the limited number caused quick sales at an advance. One lot of 80 selected were taken at 5 for Sows and 6 for Barrows; one lot of 50, more than half Sows, at 5 c; a few old Barrows at 5 and 5 1-4. At retail, 5 for Sows and 6 for Barrows, for those weighing over 60; those under 60, at 6 for Sows and 7 for Barrows.

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. n 14

MISCELLANY.

From the Independent Press.

AUTUMN.

THE faded grove is silent now,
Its songsters all are gone,
Decay has touch'd each verdant bough,
And yellow is the lawn.

No balmy odors scent the air,
No flowers their fragrance yield,
And yonder shrubs are scath'd and bare,
That skirt the desert field.

The autumn winds send forth disease
Upon the living green—
So heavy age does manhood seize,
And change its summer's scene.

The tender plants that flourish'd fair,
Now drooping 'neath decay,
Proclaim that youth and beauty are
As vanishing as they.

The scatter'd leaves that wither'd lie,
To all a warning send—
That soon, whatever is, must die
And life, and being, end.

Although mid-summer's days are past,
And sober Autumn reigns,
And leaves around are dropping fast,
The laurel leaf remains.

So, when the chilling frosts of age
Make life a desert drear,
When joys have flown and troubles rage,
Hope still is left to cheer.

E. G. P.

THE HERMIT AND THE VISION.

It is told of a religious recluse, who in the early ages of Christianity, betook himself to a cave in Upper Egypt, which in the times of the Pharaohs had been a depository for mummies, that he prayed there, morning, noon and night, eating only of the dates which some neighboring trees afforded, and drinking of the water of the Nile. At length, the hermit became weary of life, and then he prayed still more earnestly.

After this duty one day he fell asleep, and the vision of an angel appeared to him in a dream, commanding him to arise, and cut down a neighboring palm-tree, and make a rope of its fibres; after it was done, the angel would appear to him again. The hermit awoke, and instantly applied himself to obey the vision.

He travelled about, from place to place, many days before he could procure an axe; and during this journey, he felt happier than he had been for many years. His prayers were now short and few; but what they wanted in length and number, they outmeasured in fervency.

Having returned with the axe, he cut down the tree; and, with much labor and assiduity during several days, prepared the fibres to make the rope; and, after a continuance of daily occupation for some weeks, completed the command.

The vision that night appeared to the hermit, as promised, and thus addressed him: "You are now no longer weary of life, but happy. Know then that man was made for labor; and prayer also is his duty; the one as well as the other is essential to his well being. Arise in the morning, take the cord, and with it gird up thy loins, and go forth into the world; and let it be a memorial to thee of what God expects from man, if he would be blessed with happiness on earth."

AN OCTOGENARIAN.

We have, during the past summer, several times seen a venerable old man passing through our streets with a team of oxen, whose vigor and activity have attracted the notice of many of our citizens. His name is Jonathan Loomis, is 87 years of age, and he comes from Becket or Washington, on the summit of the Green Mountain range, about 40 miles to the west of us. He travels on foot, driving his oxen with loads of lime, which he brings for the buildings erecting at the United States Armory in this town.—When he has delivered his lime, he goes on 16 miles further, to Stafford, Conn. loads his wagon with soap stone, and retraces his steps to the lime kilns on the mountains. His step is firm and fearless, and he is on the whole, a remarkable instance of vigor and hardness in one so far advanced.

Springfield Gazette.

Extract from Sullivan's recent Address before the American Institute.

THE MOMENT OF PERIL.

"At this day AMERICANS are precisely at the moment of peril. The memory of colonial dependence is gone. The sentiment of acquired freedom is not a daily, constant one. It requires an effort and a course of reasoning to feel it.—Liberty is spoken of—but what ideas are suggested by this word? More probably the liberty to do just what one chooses to do, than the liberty to do what the laws of the country and society permit, which is the only civil liberty society can have; how, then, can we hope to maintain civil liberty if we do nothing to teach what civil liberty is? The first step towards such teaching is but little attended to, taking the whole of the young population into view. What is the remedy? It is supposed to be this: The Legislatures of the several States have power to do all that the exigency of the country demands. The Legislatures do whatsoever they believe constituents will approve. The first step, therefore, is to awaken the general attention to the interests of education; and to make the truth felt, that *no money, public or private, is so well laid out as that, which goes for general instruction.* Why general instruction? Because the most wise, eloquent, and honest, are powerless in a country that rules by universal suffrage, unless they speak to those who can understand. So, what avails it, if there be some who are moral, virtuous, and exemplary, if a majority of citizens are unable to comprehend the value of such qualities? *Thus, education is not a concern of a few privileged persons, but of all persons.*

Education, however, even *general education*, in the usual acceptation of the term, will not save our country from anarchy and revolution when the contrast between the rich and the poor, between rulers and the ruled, (caused by unequal privileges,) which is rapidly increasing, shall be as great here, as in the old countries.

Let every rich man be obliged to educate his children to some useful manual labor; let all education be considered worthless which does not advance the useful arts, nor add to the happiness of man; let the poor man's children have their portion of this, and the moment of peril will be yet far off."

"Thou shalt not deliver unto his master the servant who is escaped from his master unto thee. He shall dwell with thee,—where it liketh him

best; thou shalt not oppress him."—Deuteronomy xxiii. 15, 16.

BOSTON, WEDNESDAY EVENING, NOVEMBER 27, 1833.

NO. 20.

ADDRESS,

Delivered at Bridgewater, before the Plymouth County Agricultural Society, at their Anniversary, by Rev. JOSEPH RICHARDSON, Oct. 2, 1833. Published by order of the Society.

Gentlemen and Friends of the Plymouth County Agricultural Society:—In the smiles of Heaven, ever propitious to us, we have collected to-day some of the first fruits of our industry, our peaceful arts, and our prosperity. We come, not to stain, in heathenish devotion, our altars with blood, but with grateful hearts, to adore and praise the God of the Harvest. We have met to exhibit to each other, for mutual gratification and improvement, how Heaven has conferred on us power over the elements of nature, to employ them as ministers to our support and joy, and to give to industry an efficiency; though not to create worlds, to render this we possess more beautiful and pleasant.

We have met to do honor to agricultural and domestic industry; to review our reasons for contentment with our lot, and to devise what means we can, to render the good old county of Plymouth, the holy land of this western hemisphere, to our sons and daughters a pleasant land, as long as the sun and the moon shall endure.

We boast not of a land the most luxuriant. It has its rocks and sands, its sterile plains and morasses, like other sections of our country. But wherever agricultural industry and skill have applied their power, there we see in favorable seasons, fat pastures, luxuriant meadows, delicious fruits and golden harvests. This, in general, has been one of our least favorable seasons.

For some cause the population of our county and of other neighboring counties, has advanced very slowly. In years past, a flourishing commerce has allured multitudes away from the plough and the workshop to endure even harder toils, severer privations, and to gain a fortune in the end, that the industrious farmer has no cause to envy. Other multitudes, inheriting, as it were, from their pilgrim ancestors, a sort of chivalrous enthusiasm to wage war with the wilderness, have emigrated east and west and north, whom equal industry and economy would have rewarded as well in their native county. Consequently extensive tracts of finely situated land, of excellent quality, may be seen in various parts of our county, lying uncultivated and unproductive, waiting only for agricultural enterprise with the plough, to open it to the sun and rain of heaven, and to put on it a beautiful verdure and luxuriance. One half of the labor that must be applied to bring the wilderness to a productive state, would insure a harvest of equal value.

I speak of a harvest of equal value. May not this be a proper occasion to consider the question, Whether agricultural industry may not be so patronized and encouraged by the aids of better cultivation, as to retain our population in their native clime, with the prospect of as much happiness, as other parts of this country could promise them? Is this society, whose anniversary we have assembled to celebrate, pursuing unavailing measures to promote the prosperity and happiness of their fellow-citizens? Would it be best to emigrate? Possibly this season of drought and small crops may

have pressed this question upon some of our farmers, giving them sleepless hours and discontented hearts, and causing their partners to bathe their couch in tears. Would it not be wise for many more to take up their connexions and break away with tender ties severed and bleeding, to find a better country?

Within the borders of our Republic the sun rises and sets on land as fertile and beautiful as the earth bears. Travellers, and especially land speculators draw its picture with every enchantment. Let all that is true be admitted, and let the question be fairly weighed. If there is a land where freedom can be better enjoyed, luxuriant in productions, with little labor, and possessing other important advantages equal to ours, it might, perhaps, be wise to subdue our local attachments, to forget the sacred associations that make our homes dear to us, and to move onward for a deep wilderness or a broad prairie. But, having lived a little beyond the credulity of childhood, we pause a little. We have found that all, that is published and believed, is not reality.

The traveller passing along with the inspiration of his zeal to make a popular and profitable book, tells us of his delight in seeing "the emigrant rearing his log cabin,—of the beginnings of social toil in the wide wilderness,"—how beautiful are the little spots upon which the emigrants deposite their household gods;—of springs bursting forth in the intervals between the high and low grounds;—of brilliant birds chanting their mellow notes and welcoming the stranger to his joys! No, to his toils, his hardships, his sufferings, unseen and untried! All may seem beautiful to one, who only looks on to see "the patient, laborious father fixing his family" amidst this cheering of the wilderness. Does the traveller stop there to fix his own abode? No, his own sagacity admonishes him, that there are untold solemn realities to be met. He tells us that "the first residence among the trees affords the most agreeable picture to his mind; that there is an inexpressible charm in the pastoral simplicity of those years, when you witness the first struggles of social toil with the barren luxuriance of nature." This spirit of romance carries the emigrant from one scene of first struggles to another, gathering the barren luxuriance of nature, till death ends his toils, and his children are left to inherit the fortune and felicity of doing each for himself, as his father did. Toils, truly, are there demanded, where the soil is buried in deep forests of massy timber and roots, requiring a large portion of life with all the energies of a mind and a body formed to encounter the most rigorous hardships.

But there land is cheap. True, where are vast forests, extensive prairies, broad rivers and mild winters, land is cheap, and when subdued highly productive.

To an European, who desired information respecting the encouragement held out to emigrants in this country, one of the most intelligent, candid, and worthy citizens of our country gave an excellent answer to the lure held out in the cheapness of land. He tells his friend in Europe, that "many of our citizens have migrated to the west,

under the delusive expectation of purchasing lands cheaper than in the old States. They are, in fact, often much dearer when you estimate their price by the profit of the grain, which is cultivated upon them. For instance, an acre of land in Kentucky, which sells for a quarter of a guinea, and yields thirty bushels of corn, at four pence sterling per bushel, is dearer than land of the same quality in Pennsylvania, at a guinea per acre, that yields the same quantity of corn, which can be sold at the nearest mill or store for two shillings sterling per bushel." This case shows that though the land costs in the old State four times as much as in the new State, still it is the cheapest, because its produce will command six times as much money as in the new.

The scarcity of money and the impossibility of paying debts by raising produce, once and again drive the emigrant from his cabin and hard earned improvements into the wilderness. Heavy debt any where is enough to try the virtue of a christian; but in the new and sparsely settled parts of the country it holds the debtor, as by the throat, with inexorable severity. Even where they have slaves to perform their labor, and the soil is luxuriant in its products, you will hear the cry of oppressiveness of debt and poverty. There their corn will command only twelve and a half cents per bushel, and other products of industry a similar price. There, indeed, a subsistence is easily obtained; but a mere subsistence is a poor reward for industry. It permits not a spirit of enterprise to move. The arts of civilized life can scarcely advance a step. Of the moral condition of a people thus situated, our public journals are often giving us melancholy instances. There are some comparatively new parts of the country, where population and enterprise have concentrated, where markets have been created, good institutions have been founded, and the people have possessed themselves of the best means of improvement and happiness. But there, as here, all is achieved by industry, enterprise, good conduct, and the smiles of Heaven.

We desire a soil more productive and milder winters. But to gain these advantages would it be wise to part with our free schools, with a quiet and peaceable state of society, where life and property are secure, and religious order is maintained? In my judgment the most productive soil and mildest winters would be but a poor compensation for the loss of any of these blessings. With their glowing descriptions of the new countries, the best accredited travellers give us saddening views of the population, as wanting industry and enterprise, languishing, as if under the constant influence of fever and ague, debased in morals to a great extent.

I would not do injustice to any portion of our country. But we have a right to the true reasons for being satisfied with our own. The farmer, in forming a just estimate of his condition, will take an account of his labor and its products, and compare them with the privileges and blessings they enable him to procure and enjoy. Does the farmer complain that taxes are heavy, and the customs and fashions expensive, so that he cannot grow rich? Let him go back then, into a half civilized

* Flint's Valley, p. 53.

† Dr. Rush, p. 207.

state of society, where his taxes will be light, and his children may know the blessings of ignorance, profligacy, gross immorality, with no schools, no churches, no *holy* days to trouble them. He may soon leave to his children, if they have not then wasted his property, each a farm, in "the barren luxuriance of nature."

A farm! what is that, or any other earthly possession to one debased in morals and incapable of any true enjoyment? Can an intelligent and rational farmer desire to leave to his children possessions, which, through his blind avarice, they have no fitness of character to enjoy or hold in esteem?

By all fair considerations emigration should be discouraged, even from the old to the new parts of the same country, at least until by removal the emigrant may improve his condition and that of his family. It is a sound maxim in political economy, that the "emigration of industry, capital, and local attachment, is no less a dead and total loss to the country thus abandoned, than it is a clear gain to the country affording an asylum." A course of policy or of management that induces a people to leave their native section of a country is, as Christiana, a queen of Sweden described it, in reference to the revocation of the edict of Nantes, by Louis XIV. "He had used his right hand to cut off his left."

The encouragement and promotion of agricultural and domestic industry, I consider as the wisest policy that can be devised, to promote the prosperity of our county and vicinity, and to prevent the evil of emigration.

Let us adopt the improvements in cultivation, with improved ploughs and other implements: and with a small part of the expense and hardship that would attend removal and settlement in a new country, our fields would be renovated with beauty and more bountiful in harvest. We can now point to instances of enterprise animated by the countenance of this society, where a dead, worthless meadow, full of hard hack and rocks, has been converted into a beautiful lot of English grass, twenty acres yielding twenty tons of excellent hay. This the enterprising cultivator* performed without abandoning the land of his fathers, without taking his sons and daughters away from the free school, and the sound of the church bell, and the delights and decencies of good society, and without sinking into a grave never to be bedewed with the tear, or blest by the prayer of an old neighbor. We can point to many instances of improvement, where an advance of twenty-five per cent. in cost of cultivation, yields in harvest, a hundred per cent. of increase. The increased supply of agricultural products invites the mechanic and the manufacturer to locate themselves near the thrifty farmers. This revived spirit of enterprise and industry, goes into every department of life. Its ornaments and comforts greet us in our dwellings from the reciprocal affection that presides there; and its luxury crowns our table and teaches us to know more of the still richer luxury of grateful hearts.

The last census of our country gave us credit for a small advance in population; a little more than ten per cent. in ten years.

The county of Plymouth contains probably about nine hundred square miles, and, on an average, about forty seven inhabitants to each square mile,

I have no means of exact calculation, but I should judge, that as much as one quarter part of the subsistence of the whole population is drawn from the ocean, or consists of grain, flour, and other products imported into the county. Many thousands of dollars are annually paid for agricultural products, from other parts of the country, which agricultural enterprise might easily supply from our own soil. I doubt not that the county, sterile as some parts of it are, is capable of affording successful employment and support to a population of one hundred thousand, and at the same time of supplying agricultural products to support a population of one hundred thousand more engaged in navigation, fisheries, mechanical and manufacturing employments. The rise of the nominal value of real estate would enable the farmer to realize the golden dreams of his youth. In some of our towns the shoemakers and other mechanics have begun and are going on successfully to make good the calculation. Their industry creates a market for the farmer's products, and continually adds to the wealth of all classes of their neighbors.

"Health, peace, and sweet content to them it brings, More precious prizes than the wealth of kings."

The culture of SILK has engaged the attention of our enterprising neighbors in Connecticut already to a considerable extent. I anticipate that the time is not far distant, when this society will deem it an object worthy of their zealous care to promote. This article that the Emperor Aurelian thought too costly for him to afford his queen a garment of it, as its price was equal to its weight in gold, in our times gives brilliancy to every circle, whether of recreation or around the altars of religion.

The people of the United States have paid for silk, imported in one year, a sum exceeding seven millions of dollars. The annual importation of this article amounts commonly to five or six millions of dollars, and will continue to increase as population increases, unless a domestic supply reduces it. If the silk annually imported amounts to six millions of dollars, the average sum annually paid by the people of this county exceeds *twenty thousand* dollars! This sum, annually applied to reward female industry and agricultural industry, *united*, as would be happy for society that they ever should be, is an object worthy of the grave consideration of the philanthropist and the patriot.—Our soil and climate are both favorable to the cultivation of the White Mulberry tree. It loves a soil dry, and sandy or stony. It has been planted, and is flourishing in Massachusetts, N. Hampshire and Vermont. In three counties in Connecticut, whose parallel of latitude is little more than one degree south of Plymouth county, silk has been successfully cultivated for twenty years. The amount in 1810 was estimated at about thirty thousand dollars.—From three to four tols are made annually in the town of Mansfield. To measure success to this productive branch of industry, I should consider myself remiss in duty not to solicit the prompt and liberal patronage of this society. And if it should be brought before our State Legislature, it would not, I hope, be less successful than plans for reducing the representation.

Luxury has been considered as a national evil. But it is not so when it is the product of individual industry and enterprise; unless it be extorted from the individual to pamper idleness and profligacy, or minister to the excesses of corrupt courts. When industry can command its innocent luxuries

and ornaments, the brow of labor is smoothed, and domestic attachments are strengthened.—The chemists and philosophers of France labored a long time unavailingly, to introduce there the cultivation of the potato. They proved by their experiments that it was not only an innocent, but very nutritious article of food.—At length on a day of public festivity, Louis 15th wore at court a bunch of potato flowers in his button hole, and the potato became in general a staple article of food. In all countries, communities are moved and swayed by example. Let families of wealth and influence commence the cultivation of silk, and adorn themselves with the products of their own industry, and soon will this branch of industry become popular and flourishing. That is the eloquence that will have the most power in this community. Neighbor will learn from neighbor what he would never learn from addresses and books. We find so much that we hear and read useless, or inapplicable to the business of life, that we even neglect most useful theories and rules. With good point some author curiously remarks, that "Milton makes an angel warn Adam against star-gazing, and that Eve cursed her race by an intemperate curiosity for unprofitable knowledge."

And when I invite families of wealth to set examples of productive industry, I invite them to be happier than in any other way they can be permitted to be. "Comfort, plenty, freedom and virtue, all spring from industry."—The power of productive industry is the source of wealth, to individuals and communities. It becomes the highest in honor, it becomes the fathers and the matrons of our community, to see that the spirit of industry is wisely directed. The world has boasted too long of its fields of glory in human blood. Let the competition, in future, be in harvests, in furnishing and wielding implements of peaceful husbandry, in gaining successful conquests of stubborn and sterile lands, causing them to pay rich tribute to the support and comfort of man.

In the opinion of one of the best of our old patriots, (Mr. Madison) we shall concur, "That there cannot be a more rational principle in the code of agriculture, than that every farm, which is in good heart, should be kept so: that every one, not in good heart, should be made so, and that what is right as to the farm, generally, is so as to every part of every farm."

Nor is household industry, though its pecuniary compensation be small, less important than a farm in good heart, to accomplish the purposes of the farmer's enterprise. In a liberal bestowment of rewards upon female industry, agricultural societies have wisely consulted the great objects of their institution. All the virtues live by encouragement. That government that best protects and encourages useful industry, will prove its superiority to other governments.

The complaint we do hear reiterated, from a portion of our community, that for them there is no profitable employment, no means to lighten the toil that parental kindness cheerfully sustains for them; no power, as they could wish, to gladden the eye of conjugal love, that beams upon them. In the absence of the wool and flax which the manufactories have taken out of the hands of domestic diligence and enterprise, let them have the means to procure by their own industry, articles of elegance, that now take thousands from the pockets they would gladly enrich. Let them have the trees planted, and they will soon save, at home,

* Major Curtis, of Scituate.

thousands to enrich the patrimonial estates, where all their best affections centre.

Through want of enterprise at home, with fields half cultivated and unproductive, with rusty, old fashioned and awkward implements, wringing from the brow the sweat, almost without hope, with no delicious, inviting fruits in the garden and orchard, your young sons go reluctantly with you to the toils of the farm, and early begin to lay their plans to be away elsewhere, to pursue their callings and to form connexions. Good policy demands of the farmer his utmost exertions, his best calculations, to render his lots of land to his children even objects of pride. Give the farmers encouragement to emulate their sons to

—“Attend their rural care,
Feed fairer flocks, or richer fleeces shear.”

Teach them the happy lesson, that the prosperous German settlers of Pennsylvania taught their children,

“To fear God and work.”

The county of Plymouth is worthy to be viewed by its inhabitants as a patrimonial estate, consecrated by its ancient institutions. In the history of all future time it will be associated with whatever is sacred in the name of liberty, or interesting to the hopes of the world.

Though its forests have been swept away, probably not a quarter part of its soil has ever been moved by the plough. Its actual resources have slept as from the foundation of the world. The cultivated and cleared land, on an average, yields probably not more than a tenth part so much as by good cultivation it is capable of yielding. On our seaboard bounding the county to an extent of thirty miles, are offered great facilities for enriching a soil naturally good. In every part we have ready and easy access to good markets. Capital is not wanting. We want better farming, enterprise, activity, and better harmony and co-operation between the different parts of the county. Union is strength and good economy.

“The spirit of improvement is abroad.” It is manfully striving around us for pre-eminence in the arts of life. Shall we consent, without a struggle, to be left, by all, far behind? I maintain that in reality the merchant and the professional man, as well as the mechanic and manufacturer, have a deep interest in the success of the farmer. Let there be then a communion, “a brotherhood of interest, feeling and patriotism” cherished between them. Every father and mother must naturally desire to see their sons and daughters pleasantly settled around them, with prospects of competency and happiness to reap the benefits of the invaluable institutions founded and defended by their ancestors. Let this desire be cherished until in this county the first direct command from Heaven “to be fruitful, to multiply, and replenish and subdue the earth,” shall be better fulfilled. Let the arts of domestic industry be encouraged; let them be diligently inculcated and duly honored. The spirit of discontent and of a passion to rove and emigrate will dismiss its splendid dreams, nor longer pant,

“To tread the dreary paths without a guide,
As treacherous phantoms in the mist elude.”

Is confirmation of the policy now recommended, required? One of the most approved writers on political economy tells us, that “the depopulation of old Spain was owing, not only to the vicious

institutions of her government, but to the small amount of her internal products, in proportion to her territorial extent.” He adds that “the most effectual encouragement to population is, the activity of industry, and the consequent multiplication of the national products.”* The reasoning that applies to a whole country will apply to a county.

To the promotion of agricultural and mechanical science, permit me to recommend that the education in our public schools be adapted. I think that the grammar and the eloquence of a good farm, and of a well managed household, give happiest proofs of minds of most substantial merit. That is genuine education that teaches the philosophy of being virtuous and “acting well our part.” They of all classes have power to be happiest whose dependence on the favor of Providence is most direct.

The farmer’s is a generous subsistence. No luxuries can be so delicious, as the fruits of his own care and healthful toil, fresh and pure from the hand divine. His farm becomes a garden, and every where he traces the footsteps of his God, walking with him, and with many a token of love cheering his labor.

The pledge has been too recently given by our fellow citizens to be forgotten to day, that the spirit of moral pestilence, that hideous leveller of the mighty, and spoiler of youth and loveliness, has become “cursed above all cattle, and above every beast of the field.”

A land thrice made free, thrice blest. Let industry with the kindred virtues cause it to blossom as the rose, and from increasing thousands of grateful hearts to send up a tribute of perpetual praise to the Lord of all lands.

VALLEY OF THE CONNECTICUT.

No part of the Connecticut presents more extensive intervals, than those included in the towns of Northampton, Hadley, Hatfield, and Deerfield. They are composed of deep alluvion, intermixed with decayed vegetables, and generally repose on rolled masses of stones or gravel, and much of the adjacent country partakes of that character. Evidence is not wanting to prove, and the opinion is now common among Geologists that the whole basin, bounded on the highlands, east and west of the Connecticut, in Massachusetts, extending from the hills in Bernardstown and Leyden, to mounts Holyoke and Tom, below Hadley and Northampton, and the chain of hills stretching through Westfield, was, at some remote period, covered by a lake, or expansion of the Connecticut river; and that the water has gradually drained off through the southern barrier at South Hadley falls, and the passage of Westfield river, at Feeding-hills. Other similar lakes probably existed below this basin, at Springfield and Long Meadow, and at Windsor, Hartford, Weathersfield, and Middletown, in Connecticut. Similar lakes, though of less extent, once covered the intervals on the Connecticut above Greenfield.—*Hoyt’s Antiquarian Researches.*

CEMENT FOR STOVES.

A MIXTURE of salt and ashes for the crevices to be guarded against the intrusion of smoke, in stoves and pipes, is more durable than the ordinary mortar of lime and sand; beside being more convenient to obtain.—*L. I. Farmer.*

* Say, vol. 2, p. 140.

HORTICULTURAL.

WE are happy to give place in our columns to the following abstract, and hope the example of the gentlemen associated for the purpose of promoting Horticulture will be imitated, till New England can boast of at least as many Horticultural Societies as there are counties within its limits.

For the New England Farmer.

BERKSHIRE HORTICULTURAL SOCIETY.

A meeting of citizens of the county of Berkshire, for the purpose of forming a Horticultural Society for said county, was holden at Lenox, Nov. 5, 1833. Theodore Sedgwick, Esq. was called to the chair, and H. W. Bishop, Esq. appointed secretary. The committee appointed at a previous meeting to draft and report a constitution reported, and a constitution was adopted. The Society elected the following officers for the year ensuing.

THEODORE SEDGWICK, President;

E. A. NEWTON, Vice President;

M. A. LEE, Corresponding and Recording Sec.;

H. W. BISHOP, Treasurer.

Resolved, That the officers of the Society be constituted a committee to report a code of by-laws, at the next stated meeting of the Society.

Resolved, That — be constituted a committee to solicit subscribers to the constitution.

Resolved, That the several towns in the county be requested to form societies auxiliary to this Society.

Resolved, That the officers of the Society take the necessary measures for obtaining an act of incorporation.

Resolved, That the Secretary prepare a copy of the doings of this meeting for publication in the several papers of the county, and in the New England Farmer, and that Mr. S. W. Bush be requested to furnish a copy of his Address (delivered at a former meeting) for publication in the N. E. Farmer.—Adjourned.

Attest, M. A. LEE, Secretary.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUIT AT THE MASS. HORT. SOC. ROOMS.

Saturday, Nov. 23d, 1833.

Apples. Sans Parel, from WM. PRINCE & SONS, L. Island, fine fruit.

Pudding Sweeting, from Mr. HOWE, Princeton, very fine.

Jelliflower Rouge, from Mr. STETSON, Waltham.

Seedling Apple, from Mr. HOWE, Princeton, very good.

ISAAC P. DAVIS, Esq. “Tolman’s Sweeting,” a fine baking apple.

Spanish Reinette, from a dwarf tree 4 feet high, bearing 42 fine fruit, by SAML. POND, a fine sharp high flavored apple, great bearer.

Chaumontelle Pear, from DAVID DUDLEY, Esq. Roxbury.

For the Committee, SAMUEL POND.

A special meeting of the Committee on Fruits will be held at the Horticultural Hall on Saturday the 30th inst. at 1 o’clock, P. M.

For the Committee, SAML. POND.

EXHIBITION OF FLOWERS.

THOMAS MASON, Charlestown Vineyard, variety of Chrysanthemum flowers.

By order of Committee, JONA. WINSHIP, Ch.

In last Farmer the Pear from Mr. Wigglesworth’s garden should be *Doynne* Gris instead of *Beurre* G.

From the Plymouth Memorial.

THE VINE.

I LEARN by my own observations and by newspaper intelligence, that there has been an unusual deficiency in the production from the vine the past season. It would be gratifying, were some of our skilful cultivators to make us acquainted with the true cause why in some situations the fruit of the vine answers every expectation and desire, while in others there is a total disappointment. I am indeed convinced that foreign grapes cannot be advantageously cultivated in open ground in our climate. This is greatly to be regretted, since the Black Hamburg, Black Cape, Chasselas, Sweet Water, &c. surpass all others in excellence and beauty. These and numerous other luxuries, however, we cheerfully resign to our opulent brethren, who can afford to bestow on them skilful culture and glass-house protection, especially since they are so well disposed to greet our horticultural table with clusters of unrivalled size and richness of quality. Nor do I believe that any length of time will acclimate the foreign vine to our region, if I may judge from trials in some of our gardens of more than 30 years standing, though it must be admitted that they have not been under judicious and skilful management. It has been observed the past season, that the Sweet Water has succeeded best when suffered to run on the ground. In several instances clusters have been found lying on the ground concealed in the grass and weeds that attained to perfect maturity and ripeness, when those trained on trellises and fences were entirely spoiled by mildew. In one instance, 8 or 10 vines of the Sweet Water have been cultivated without any interruption to their natural course; never pruned nor covered in winter, but allowed to spread over the ground to any extent. The last summer their produce was extraordinary, great expectations were raised. The thick foliage entirely secluded the fruit from the sun, air and dews; but in the end this proved only a partial security, full two thirds of the fruit were destroyed by the mildew, but the residue were fine, well ripened clusters.—In the same garden those trained on trellises, and had received much care and attention, produced none but poor blasted fruit. It seems to be well ascertained that the Isabella is by far the most sure and productive of any other variety, and being a native requires no winter covering. The Catawba grape is also a native, and is attaining to a high reputation as it becomes more known; the fruit is esteemed as preferable in delicious quality to the Isabella. For making wine it is considered superior to any other grape yet discovered. "This vine," says Mr. Kenrick, "is very vigorous and hardy, requiring no protection, and is a great and certain bearer." These two varieties, being natives, are deserving of preference to all others for cultivation in our gardens in this place, and the fruit which they produce when fully ripe is sufficiently delicious for any palate that has not been pampered with more luxurious dainties. It has been supposed that our native grapes are not liable to the mildew, but the present autumn has furnished many instances of the Isabella being affected with that disease; but chiefly in situations where they are secluded from a free circulation of air. In one instance the vine has spread over a large building and ascended to the eaves of the house; it has this season produced thousands of clusters, all of which were blasted, except a very few bunches near the eaves where

the air could have free access to them.—There is in a damp and confined situation a vine that has never received the pruning knife, and has now overspread an apple tree; its produce has been this season remarkably abundant, but all spoiled by mildew, not a single grape fit to be eaten. In an adjoining garden the vines on trellises and pretty closely pruned, have yielded equally abundantly, and the greater proportion of the fruit was free from the disease. In regard to pruning, I consider a judicious use of the pruning knife indispensable necessary, but too close pruning proves injurious.—All superfluous branches should be cut away, and the bearing shoots should be shortened soon after the fruit is formed. We have in our woods a variety of grapes indigenous to our soil, and attempts are making to cultivate them in our gardens, but hitherto without much success, which is probably to be ascribed to the want of the pruning knife. Full one half of the vines in our woods are barren. I knew a vine that was transferred from its wild state into a garden, while in a bearing condition, which flourished very luxuriantly for more than 20 years without producing fruit, never having been pruned; it was at length cut down and the stock engrafted with the Isabella, which now produces very abundantly. It may be doubted whether transferring the old stocks from our woods should be preferred to propagating the vine by cuttings. A farmer had a number of the native vines growing on his farm which had always during his memory been barren, but having cut them down with his scythe, they became abundantly productive the next year.

That voracious reptile, the cankerworm, has proved very destructive to many orchards in this vicinity the last summer, notwithstanding the free application of tar. Major S. Frazier, a skilful agriculturist of Duxbury, has invented a composition which proves a more effectual remedy against the cankerworm than any other which has been before known. It consists of soft soap, whale oil, and common liquid varnish, in equal parts. This is easily applied with a brush, and when repeated occasionally as it becomes dry, proves very effectual, and is not like tar injurious to trees. The same composition would probably serve as a protection against the apple tree borer, if applied at the proper season; and also in protecting peach trees from the attack of the fly that deposits her eggs in the bark near the root, from which proceeds the peach-tree worm. I have applied it to my young peach trees the past summer, and have no doubt of its utility, as no insects will encounter the odor and tenacity of this substance. In fact, the Frazier compound is, in my opinion to be considered a valuable acquisition to our remedies against the annoyance of insects. Peach trees have not in general succeeded well in this place; the cold east winds from our sea-board have a fatal effect on the buds of spring. I have now adopted an expedient, which I hope will in some measure remedy this evil. I have surrounded the trees near the root with a bed of sea-weed, which I conceive will preserve the roots both from the effects of excessive frost during winter, and the influence of the vernal sun raising the sap into action too early in the season.—The sea-weed will, I think, retard the raising the sap, and of course the development of the buds several days later, and the tree will besides derive beneficial effects from the alkali with which the article is impregnated.

JAMES THATCHER.

From Goodsell's Genesee Farmer.

SILK.

WE have a fine specimen of Sewing Silk, left at our office, which was manufactured by E. Stanley of Ogden, Monroe county. This silk, which is pronounced by mechanics to be equal to the best Italian, was produced by a second crop of worms, which Mr. Stanley informed us was hatched unintentionally.

This gentleman having commenced the cultivation of the Mulberry the last year from seed, procured some eggs from which he hatched a few hundred worms, which he fed from his young seedlings, rather as a matter of experiment than for profit.—After the worms had formed the cocoons, he selected as many as he wished for the purpose of laying eggs for the coming year, and the remainder on the cocoons he attempted without any other apparatus than the common wheel to manufacture into sewing silk, in which he succeeded beyond his expectation, and he declared to us that the process was not as difficult for him as it would have been to have spun either flax or wool.

The moths which hatched from the selected cocoons, were allowed to deposit their eggs upon paper, which he intended to keep until the next year.—Not being aware of the necessity of putting them immediately in a cool place, he soon observed that many of the eggs were hatching out. He commenced feeding the young worms, and says that they were equally as healthy as his first. The silk made from them was evidently of a finer quality than that which was from the first crop. By this accidental operation, Mr. Stanley has satisfied himself that two crops of worms may be reared in this climate to advantage. He further stated, that young seedling trees would, the year after planting, support one worm each of the two crops, or two worms for the season. If this is correct, then the raising of silk may be commenced in our country much sooner than has been anticipated, and the quantity need not be limited. One pound of fresh Mulberry seed sown upon an acre of ground would probably produce one hundred and fifty thousand trees; and if each tree would support two worms the second year, it is reasonable to suppose that they would support four the third year, which would be at the rate of six hundred thousand worms to the acre. This tells large, but nevertheless we think it is possible.

Mr. Stanley said, he found the business altogether more simple than he expected, and that he twisted his silk directly from the cocoons. He thinks that sewing silk can be made in this country without having the prime cost exceed two dollars per pound.—Should further experiments prove Mr. Stanley's calculations correct, what a source of wealth the silk business may be to this country.

Perhaps there is not a county of the same size in the whole United States that exports as much wheat as the county of Monroe, and even the amount of this staple would become a mere trifle compared with the amount of silk which might be produced in this county without diminishing the crop of wheat materially.

The people of this section have long been inquiring for the best plant, for the purpose of forming hedges, and we believe there is no one that proves so fair, to be useful for that purpose, as the White Mulberry, not taking into consideration their value for feeding silk worms. Should they be found to answer this double purpose, then it would be an object, not only of individual profit

but of national consequence to have them extensively introduced.

It is said we import annually a greater amount of silks, than we export bread-stuffs. Our government should look to this as it only wants a very little encouragement at the commencement, after which it will need no protection to insure its continuance.

Much has been said, and very justly, respecting our neglect of Ornamental Husbandry. Strangers notice that our streets, and pleasure grounds are not set with trees for this purpose as they should be. "There is a time for all things." Our business has been to clear our lands of the forest trees which were found upon it, and to render the fields productive. This to a good extent has been accomplished; and the time has now arrived, when those who came into this then wilderness are prepared to commence embellishments, and more particularly so when they can be made profitable. Few trees are more ornamental when grown than the Mulberry, and few during the season of their fruit do more towards inviting the feathered songsters about our dwellings, which do much towards enlivening the scene, by disputing proprietorship to the fruit with the little urchins of the neighborhood.

It does not at present appear necessary that a farmer in order to make a few hundred dollars worth of silk annually, should devote any of his choice wheat lands to the raising of Mulberry trees, but on the contrary he may make cheap hedges about his fields, which while they protect his crops promise to compensate by their leaves any costs that he may be at in rearing them. By lining the roads and filling up a few broken pieces of ground, each farmer may have trees sufficient to employ all the spare labor of his family to advantage.

It has been a matter of frequent conversation among farmers of late years, that since the introduction of manufacturing establishments, that the female part of families were not as profitably employed as formerly. We are ready to grant the position, and as the custom of our country does not countenance the practice of females laboring in the field, the raising and manufacturing of silk is admirably calculated to give, not only a pleasant but lucrative employment to this part of society.

We are aware that it has been the policy of other nations to endeavor to prevent our commencing the manufacture of silk, and this they have successfully done by filling our heads with false ideas respecting the extreme intricacy of the operation. Let there be once an excitement produced respecting this business sufficient to call the ingenuity of our Yankees to it, and they will at once divest it of all the mystification of the Europeans, and render it as simple as digging potatoes, and will introduce such labor saving machines as will defy all foreign competition.

The first step should be to commence sowing the seed and raising the trees, and be assured as soon as the trees are ready there will be enough ready to do all the remainder of the process.

We have the promise from Mr. Stanley of a full description of his success with his worms, &c. the past season, and hope to be able to give it in our next.

Ruta Baga. Mr. Cobbett says, "A Hog of a good sort may be sufficiently fattened with this root when steamboiled."

APPLE BUTTER.

THE following has been furnished to us, by a correspondent, as a correct account of the best way of making Apple Butter, so little known in the southern states, and so much valued in the northern:

"First, boil down the best flavored cider, of selected fruit, (and sweet is the best to keep) to two thirds of the quantity put in. To every barrel of cider, put in six bushels of apples, of best quality, pared, quartered, and cleaned of the cores, and free from rots and bruises.

"As soon as boiled down one-third, as above, feed in the quartered apples as fast as they boil away, which must be done in brass or copper. It is best to have two kettles, in order to supply the finisher from the other, which keeps it from boiling the apples too much. It will require from 12 to 18 hours constant and moderate boiling, when it must be stirred at the bottom to prevent its burning, by a long handle, with a piece of wood three or four inches wide attached to the other end.

"To know when it is done, cool and try some of it on a plate, till the liquid ceases to run from it. Towards the close of it, some put in cinnamon, cloves, and alspice.

"If only one kettle is used, each parcel of raw apples must not be boiled or brought down too much before another supply is added. If it scorches in the operation, it is ruined. As soon as done, it must be taken out immediately from the kettle into wooden vessels to cool, and afterwards into crocks, or stone ware, or wood; but in order to keep it best in summer, crocks of stone ware are to be preferred."—*Gen. Farmer.*

From the Maine Farmer.

SOILS FOR WHEAT.

It will be recollected that in a late number we published the answer of the editor of the *Genesee Farmer*, Mr. Goodsell, to our inquiry respecting the geological nature of the soil of Wheatland in New-York. The land which (with grief we say it) gives us bread, and receives our earnings in payment. The answer was a scientific description of the geological formation of that territory, and presented it so clearly that one acquainted with that science could see it in his mind's eye as he read.

Now, although our rock formations are very different from theirs, we have substantially in many parts of our State, soils which come very near to that of western New York. We have in this very town lime rock—calciferous slate, and pyritiferous or pyritous rock, that is to say, in common talk, copperas rock. Our lime rock is primitive, or contains no organic remains, such as shells, tadpoles and toadstools.—Theirs is secondary, and contains the remains of what was once organized and living animals; probably from this circumstance it is more easily decomposed. We have, strictly speaking, no bituminous shale; but sand, gravel, and alumine or clay are plenty. Our lime rock is not sufficiently pure for profitable use as cement in building, but sufficiently so for agricultural purposes. On the farm of E. Wood, Esq., about two miles out of this village, there is plenty of this kind of lime rock, and also in the land adjoining thereto. It would be an object to burn this lime for the purposes of manure; and it is not improbable that a vein of pure lime will hereafter be discovered in this vicinity, from

which may be obtained good lime for mortar. This formation extends north-easterly we know not how far. Sometimes the lime predominates, sometimes the gneiss and mica slate predominates, and sometimes pure roofing slate or argillite predominates. Hence we infer, that at some future day Marl of a good quality may be found among us, which will in our humble estimation be much more productive of good to the community than the richest mine of gold.

From Goodsell's Farmer.

SUGAR FROM BEETS.

WE are often inquired of as to the method of making Sugar from Beets, quantity produced, &c.

France is the only country where the manufacture of Sugar from Beets is practised to any great extent, and we are not sufficiently informed as to the profit which at present attends it, to enable us to say whether, or not, it could be introduced into this country to advantage.

For the purpose of manufacturing, the roots are first washed with a brush and made perfectly clean; in some instances the skin is removed by scraping. They are next grated to a pulp, by machinery.—For this purpose different machines are used according to the caprice of the manufacturer. The roots are put endwise against the revolving grater, whether it is a flat, or cylindric revolving grater. These graters are formed upon the same principle as our grater Cider Mills, with a vat beneath for receiving the pulp. With this pulp a small portion of quick lime is added to neutralize a peculiar acid contained in the beet. The pulp is next boiled, and the juice is afterwards separated by pressure, then boiled again and the matter rising to the top is removed by skimming. After the juice has been sufficiently concentrated it is put into vessels to cool, when the sugar crystallizes and falls to the bottom. The fluid part is decanted and again boiled and cooled as before. The sugar thus produced is a coarse brown article which is re-dissolved and refined by the common process.

The quantity of sugar produced from different varieties of beets is variable. The bright yellow is said to produce the most from a given quantity of roots, and the white the least. One hundred pounds of roots are allowed to produce about seven pounds of refined sugar.

After the juice has been extracted from the pulp the remaining part is fed to both cattle and pigs.

A HOG

—Is now exhibiting in Albany, which was raised in Warren county, Ohio, and is believed to be the largest in the United States. He is nine feet in length, four feet eleven inches in height, measures eight feet three inches round the body, and his weight is *fourteen hundred pounds!* He is of the Russian breed, and is three years and four months old.—*Litchfield Enq.*

Chance has led to the discovery of a method of preserving potatoes, which is both simple and attended with little or no expense. A house-keeper had placed in his cellar a quantity of charcoal. Having removed it in autumn, without sweeping the dust which covered the ground, he caused a large quantity of potatoes to be laid on it. Towards the spring, those roots were preserved, had thrown out no shoots, and were as fresh and well flavored as ever.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 27, 1833.

FARMER'S WORK.

THERE may, perhaps, be time enough before winter commences in full severity to construct or modify barn yards, cattle sheds, &c. so that they may be better adapted to making and saving manure than some, which seem contrived on purpose for wasting the principal means of fertilizing farms and gardens.

The farm yard, which may be called the farmer's manure-manufactory, and chief magazine for the food of plants, should be on the south side and adjacent to the barn. The other farm-buildings, such as the cattle sheds, hog-stye, corn barn, &c. should be erected on the east and west sides of this yard to afford shelter to cattle from driving storms and cold winds, and to make it convenient to convey the manure and rubbish of those farm buildings to the said farmer's bank of discount and deposit.

The size of the cattle yard should be proportioned to the quantity of stock to be kept in it. With regard to the shape and manner of making, &c. we will give again* Judge Buel's judicious directions: "Excavate the centre to a concave form, placing the earth removed upon the edges or lowest sides, leaving the borders ten or twelve feet broad, of a horizontal level, to feed the stock upon, and from two to five feet higher than the centre. This may be done with a plough and scraper, or shovel and hand-barrow, after the ground is broken up with the plough. I used the former, and was employed a day and an half, with two hands and a team, in fitting two to my mind. When the soil is not sufficiently compact to hold water, the bottom should be bedded with six or eight inches of clay, well beat down and covered with gravel or sand. This last labor is seldom required, except where the ground is very porous. My yards are constructed on a fine loam resting on a clay subsoil. Here should be annually deposited, as they can be conveniently collected, the weeds, coarse grass and brakes of the farm; and also the pumpkin vines and potato tops. The quantity of these on a farm is very great, and are collected and brought to the yard with very little trouble by the teams returning from the fields. And here also should be fed out or strewed as litter, the hay, stalks and husks of Indian corn, pea and bean haulm, and the straw of grain not wanted in the stables. To still further augment the mass, leached ashes and swamp earth may be added to advantage. These materials will absorb the liquid of the yard, and, becoming incorporated with the excrementitious matter, double or treble the ordinary quantity of manure. During the continuance of frost the excavation gives no inconvenience; and when the weather is soft the borders afford ample room for the cattle. In this way the urine is saved, and the waste incident to rains, &c. prevented. The cattle should be kept constantly yarded in winter, except when let out to water, and the yard frequently replenished with dry litter. Upon this plan, from ten to twelve loads of unfermented manure may be obtained every spring for each animal; and if the stable manure is spread over the yard, the quality of the dung will be improved, and the quantity proportionably increased. Any excess of liquid that may remain after the

dung is removed in the spring, can be profitably applied to grass, grain or garden crops. It is used extensively in Flanders, and in other parts of Europe."

With regard to letting cattle out of their yard to water, Dr. Deane observed, "The practice of driving cattle to water, at a distance, is attended with great loss of manure. The well that serves the house, or one dug for the purpose, should be so near the yard that a watering trough may reach from it into the yard." Some have a well in the yard; but this is not so advisable, as the water may become impregnated with the manure and thus be unwholesome as well as unpalatable.

The practice of having a barn yard so situated on a declivity, that the wash may spread over a portion of land near it, is not to be commended. A small quantity of land very near the yard may thus be made too rich, by the liquid manure, which, if retained within the yard, might be absorbed by straw and other litter, and its value be thus enhanced for manuring other parts of the farm. The enriching substances of the farm yard should be judiciously applied and distributed to be of much service to the cultivator.

An Apple Tree in Duxbury, on the farm formerly occupied by Col. Partridge, produced this season, 121 bushels of apples. The Tree is said to be upwards of one hundred years old.—[Communicated.]

CHAPPED HANDS.

To have chapped hands is always an unpleasant, and not unfrequently a painful complaint, at this season of the year.

The following is the best remedy with which we are acquainted:—wash your hands with castile soap; apply it with a flannel, and if necessary use a brush, in order to get the dirt from under and around the nails and fingers, till they are perfectly clean. The water in winter, if convenient, may be warmed; then rinse them in a little clean water, and while they are wet rub them well all over with about half a tea spoonful of good honey; then dry them well with a clean towel. This should be done once or twice a day, and always before going to bed.—*Goodsell's Genesee Farmer.*

BEAUTIFUL NATIVE PLANTS.

It is a good time now to remove the *Hepatica* and the *Sanguinaria* from the woods, and to plant them in the garden on the north side of a fence, or wall. This aspect retards their growth in spring, which is favorable on account of the frost; preserves their blossoms from the sun, and greatly increases their duration. In the open border they are so transitory as hardly to deserve a place; but when protected in the manner proposed, they are very beautiful, and occupy but very little room.

The popular name of the *Hepatica triloba* is *Liverwort*, the same that has been used in diseases of the lungs; and that of the *Sanguinaria canadensis* is *Blood root*.—*Ibid.*

DOMESTIC ANGOLA GLOVES.

"You can have no more of a Cat than her Skin," is an old adage, but we are now fully convinced that it is not a true one. A gentleman of this town exhibited in our office a few days since, a pair of handsome Gloves, very much of the appearance of the Angola in softness and complexion. We were rather surprised at the novelty of their being produced from the back of his common house CAT, of

the *Maltese* species. The fine hair was combed from her back at the season when she would naturally shed her coat, and the product of two years has enabled his wife to prepare this new and elegant species of domestic manufacture.—*Portsmouth Jour.*

ITEMS OF INTELLIGENCE.

Statistics of the Globe. The population of the Globe is estimated variously from 600,000,000 to 800,000,000; the geographical square miles at nearly 38,000,000, or 49,000,000 English square miles. The population to a square mile is, in France 61, Asia 27, Africa 10, America 3, Oceania less than 1; the average of all about 17. The densest population in any whole province or state, is in Hamburg, where it is 1302 to a square mile. It is 980 in Bremen, 783 in Frankfort, 523 in Lubec, 464 in Lucca, (Italy,) 392 in Belgium, 314 in Saxony, 277 in Holland, 257 in Great Britain, the Sicilies 236, 208 in France, Austria 165, Prussia 155, Portugal 121, Denmark 119, Spain 101, Turkey 63, Greece 51, Russia 37.

In Asia some provinces have a population of from 200 to 500 to the square mile; Japan 139, China 42, Siam 57, English Indian Empire 185. In Africa, Morocco has 46, Tunis 45, and some of the interior kingdoms a little more. In America, Hayti has 36, Central America 12, Chili 10, United States 7½, Mexico 6.

The votaries of the different religions are reckoned as follows by Pinkerton:—Christianity 235,000,000. Judaism 5,000,000, Mahometan 120,000, Bramanism 65,000,000, Buddhism 180,000,000, all others 100,000,000.

The dwelling house of Mr. Wm. Woodbury, in Lebanon, was burned on the night of the 20th, between the hours of ten and eleven by ashes being placed in a shed adjoining, most of the furniture was saved in the lower rooms. In the chambers and cellar all was lost. \$1000 no doubt is a reasonable estimate of the loss. When will our citizens abandon the wicked practice of endangering their lives and property in the manner above?

Newport Spectator.

Capt. Ross and the Arctic Expedition.—The Caledonian whaler from the Davis' Straits fishery, reports having fallen in with the Aifred whaler, of Hull, which had touched at a small island, Lancaster Sound, where the men found two or three portable soup cannisters, and a quantity of tobacco pipes, on which, was the word "Deptford." It was conjectured that these articles had belonged to the unfortunate expedition of Capt. Ross. There was not the slightest appearance that there had been any erections for shelter; but the remains of a human hand were also picked up.

The winter seems to threaten severity. Snow has fallen slightly, both to the south and north of us; and a degree of cold, unusual at this season, already prevails. Happily, the provision of coals in this city is ample, and all the time on the increase; and the very general use of the anthracite as a fuel, renders the question of the quantity of wood, of less consequence. Of that too, however, judging by prices, there is a good supply.

N. Y. American.

United States and Alabama. The general government has chartered two vessels at Baltimore to take five hundred troops to Alabama. We have not heard of any new difficulty with Gov. Gayle, or of any particular service for these troops, and it is probable they are only intended to relieve those which are already in Alabama, a part having quarrelled with the State authorities.

The new floating steam-bridge, intended to ply between Morice Town and Torpoint, was tried on Thursday last, when it passed and repassed several times. The Right Hon. R. P. Carew, Mr. Reudel, engineer, and others, were present, and were much gratified at the success

* See N. E. Farmer, vol. iv. p. 402.

of the undertaking. The average time occupied in passing from one shore to another (a distance of $\frac{3}{4}$ of a mile) did not exceed five minutes, and on one or two occasions she did the passage in 4 1-2 minutes, with the utmost ease, stopping to an inch, when directed by the conduct. or. The weight of the machinery on this bridge is 45 tons, the draft of water 2 feet 3 inches—the chains weigh ten tons each.—*Davenport Journal*.

There was shipped from Catskill, N. Y. on the 9th inst. 410,000 lbs. of butter, valued at \$61,500. The quantity to be sent from that place this season, it is calculated, will exceed the quantity shipped last year, to the full amount of between two and three thousand firkins, weighing each 100 lbs. net.

How to get a tight Ring off a Finger.—Thread a needle flat in the eye with strong thread; pass the needle with care under the ring, and pull the thread through a few inches towards the hand; wrap the long end of the thread tightly round the finger, regularly, all down to the nails, to reduce its size. Then lay hold of the short end of the thread, and unwind it. The thread, pressing against the ring, will gradually remove it from the finger. This never-failing method will remove the tightest ring without difficulty, however swollen the finger may be.—*Liverpool Times*.

More Lives Lost.—The steam boat Caspian was burnt near the mouth of Red river on the 3d inst. and between twenty and thirty people perished in the flames.

HAY, STOCK, &c., AT AUCTION.

WILL be sold at Public Auction, on Friday, Nov. 29, 1833, at one o'clock P. M., on the farm in Dorchester lately owned and occupied by Mr. Jeremiah Hill, of Boston, and 1 1-2 mile south of Jamaica Plain, the following articles:

4 COWS, 2 Yoke Oxen and Yokes, 1 Horse—kind and sound, 3 Hogs, 1 Chaise and Harness—Boston built, 1 Ox Wagon, 1 do. Cart, 1 Horse Wagon, Ploughs, Harrows, Churns, Lot Cabbages, Ox Sled, Harnesses, &c., 15 tons English Hay, 200 bushels Potatoes, 50 do. Corn, 60 do. French Turnips.

The above will be sold without reserve. Conditions liberal. ABRAHAM F. HOWE, Auct.

Roxbury, Nov. 18, 1833.

The above Farm is offered for sale on accommodating terms. It contains one hundred acres of prime Land, well watered, with a genteel Mansion House, Farm House, and one small tenement. A large Barn with a cellar under the same, built the last season, and cost seventeen hundred dollars.

Inquire at this Office. 21 nov 20.

SEED OF THE TRUE COCKSPUR THORN.

Being the same as the Hedge of J. Prince, Esq., Jamaica Plain, as yet perfectly free from all insects, and an elegant Hedge—15 years old. One dollar per quart. n20

JOHN SCOTT'S LEGACY.

THE Board entrusted with the management of the fund bequeathed to the Corporation of Philadelphia, by the late John Scott of Edinburgh, "for distribution of premiums to ingenious men and women, who make useful inventions," hereby give notice, that in three months from this date they will award a premium to Adam Brooks of West Scituate, Massachusetts, for an apparatus for—1. Reeling Silk from Cocoons: 2. Spinning or Twisting the Silk: 3. Doubling and Twisting it—all by one operation, provided satisfactory objections to the originality of said apparatus are not made in the meantime.

The Members of the Board are,

JAMES MEASE,
ROBERT HARE,
JAMES DONALDSON,
WM. HEMBEL,
WM. PHILLIPS,

To any of whom application for premiums may be made. Philadelphia, Oct. 22, 1833. oc 23-d31g.

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sept 11 cow6w

AMERICAN HEARTH RUGS.

JUST received at 414 Washington street, a fresh supply of Hearth Rugs, from the Tariffville Factory, manufactured expressly for the subscriber—they are superior in beauty and fabric to any imported. E. S. BREWER.

N. B. E. S. B. will receive orders to manufacture Rugs to match any carpet. isceptJ1 nov 23

25,000 YARDS COTTON FRINGE.

JUST received from Philadelphia, and for sale by ELIAB STONE BREWER, No. 414 Washington street. oct 31

STEAM RICE MILL, AT SOUTH BOSTON.

THE subscriber having purchased the Patent Rice Machines of Messrs. Strong, Moody & Co. of Northampton, with the exclusive privilege of using them in Boston and a large vicinity, has put them in operation at South Boston, near the Free Bridge. It is well known that rice in its rough state, or with its outer hull on, will keep many years, and that after being cleaned, it is subject (particularly in warm weather) to weevil, and other insects, and is usually put in bad casks—he therefore hopes, by having this article always in a fresh state, in casks of different sizes, to meet with a ready sale. The mode of cleaning being entirely different from any other now in use in any other country, the grain is kept quite whole and very clean. It will be put in good casks of usual size, for export; also in barrels and half barrels, and in bags of 100 lbs. each, (which may be returned;) also, ground into fine Flour, in quarter barrels—it will be delivered in any part of the city, for a reasonable charge, and will not be sold in smaller quantities. Also, the fine Bran, or Flour, so called in the Southern States, being the inner coat of the grain, excellent food for horses, cows, hogs, sheep and poultry—and the outer Hull, a prime article for packing glass, crockery, bottles and fruit, and is believed will prove valuable in making Coarse Paper, will be sold at a low price in large quantities.

This Rice is particularly recommended for whaling ships and others going long voyages, as from being highly polished, and free from dust and flour, and being put into their tight iron-bound casks, it will be free from any insects, until exposed to air.

[An Order Box is placed in Mr. Roger's Foreign Letter Office in the area of the City Hall, and a sample of the Rice in several Insurance offices, State street. JOHN PRINCE. South Boston, Nov. 16, 1833. if

IMPROVED DURHAM SHORT HORNED CATTLE.

FOR sale, one three year old bull of a brown color, 2 yearling bulls both red, 3 bull calves 1 red, 1 red and white, and 1 wholly white, also 3 two year old heifers, 2 roan and 1 brown and white, 3 yearling heifers, 1 roan, 1 red and white, and one flecked. The dams of the above have given more than 20 quarts of milk a day on grass only.

Also, 2 bull calves, one bright-red, and one red and white. They are all descended from the famous imported Bulls, Bolivar and Coelebs, and from cows of imported stocks.

For milkers, working oxen or Beef, this stock is considered 2d to none in New England. Inquire of Mr. Geo. C. Barrett, Office of the N. E. Farmer. optf

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug 28

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

WHITE MULBERRY TREES.

5000 Vigorous and large White Mulberry Trees for sale low—Apply to GEO. C. BARRETT, New-England Seed Store.

NEW ENGLAND FARMER ALMANAC FOR 1834.

JUST published and for sale by Geo. C. Barrett, No. 52 North Market street. The New England Farmer's Almanac, for 1834, by T. G. Fessenden, editor of the N. E. Farmer.—Astronomical calculation by R. T. Paine, Esq. Dealers supplied on liberal terms. oct 9

BRIGHTON MARKET.—MONDAY, NOV. 25, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 2240 Beef Cattle, 100 Stores, 1900 Sheep, and 600 Swine.

PRICES. Beef Cattle.—The snow storm prevented many purchasers from attending, and sales went off rather heavy, but at about last week's prices, viz: prime \$5 a 5 50; good at 4 50 a 5.

Barrelling Cattle.—Mess \$4 12 a 4 25; No. 1, 3 62 a 3 75; No. 2, 3 25 a 3 50.

Sheep.—Rather dull; lots were taken at \$1 42, 1 62, 1 71, 1 88, 2, 2 12, 2 17, and 2 33. Wethers at 2 50, 3, and 3 75.

Swine.—Several lots were taken at 5 for Sows, and 6 for Barrows; one lot 4 3-4 for Sows, and 5 3-4 for Barrows. At retail, 6 for Sows, and 7 for Barrows, for those under 100; those over 100, 1-2 cts. less.

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. n14

MISCELLANY.

SUMMER'S GONE.

BY MRS. MORTON.

HARK, through the dim woods dying,
With a moan,
Faintly the winds are sighing—
Summer's gone;
There, when my bruised heart feebleth,
And the pale moon her face revealeth,
Darkly my footstep stealeth
To weep alone.
Hour after hour I wander,
By men unseen—
And sadly my wrung thoughts ponder,
On what hath been.
Summer's gone!

There is our own green bowers,
Long ago,
Our path through the tangled flowers
Treading slow;
Oft hand in hand entwining,
Oft side by side reclining—
We've watched in its crimson shining
The sunset glow.
Dimly the sun now burneth
For me alone—
Spring after spring returneth.
Thou art gone,
Summer's gone.

Still on my warm cheek playeth
The restless breeze:
Still in its freshness strayeth
Between the trees.
Still the blue streamlet gusheth—
Still the broad river rusheth—
Still the calm silence husheth
The heart's disease:
But who shall bring our meetings
Back again?
What shall recal thy greetings—
Love in vain!
Summer's gone!

DESCRIPTION OF AN AMIABLE WIFE.

DODSLEY in his Economy of Human Life, has finely depicted a valuable woman, pronouncing her with the wise man of old, the first and noblest of human benedictions, winding up his eulogiums with those remarkable lines:

"Happy the man that shall call her wife,
Happy the child that calls her mother."

Among other merits which he celebrates are the following:

"She presides in her house, and there is peace; she commands with judgment, and is obeyed; the law of love is in her servants' hearts; her children reverence her precepts, and her husband with rapture hears her praise in the gate—she is the best counsellor, example, friend." What higher felicity can be imagined than a union with so amiable a creature! and notwithstanding the degeneracy of the times, many, very many are to be found by those who seek them worthily.—*Casket*.

DEFINITION.

THE editor of the Lancaster Journal says, "intemperance is the consumption of the soul." We mean no kind of pun when we say it is a consumption of the spirit. Mind and matter all go, and he who embraces the bottle is like the Spartan boy with the stolen 'fox'—hugging close that which will eat out his vitals.—*U. S. Gaz.*

SELECT PROVERBS OF ALL NATIONS.

THE first chapter of fools, is to esteem themselves wise.

The longest life is but a parcel of moments.

Truth hath always a fat bottom.—*Gaelic*.

Vain glory blossoms but never bears.

We have all forgotten more than we can remember.

Vice is its own punishment, and sometimes its own cure.

The greatest learning is to be seen in the greatest plainness.

The first degree of folly is to think one's self wise; the next to tell others so; the third to despise all counsel.

The example of good men is visible philosophy.

LONGEVITY OF THE SWAN.

THE other day, a male swan which had seen many generations come and go, and witnessed the other mutations incident to the lapse of 200 years, died at Rosemount. He was brought to Dunn when the late John Erskine, Esq. was in infancy, and was then said to be 100 years old. About two years ago he was purchased by the late David Duncan, Esq. of Rosemount; and within that period his mate brought forth four young ones, which he destroyed as soon as they took the water. Mr. Molleson, Bridge-street, in whose museum the bird is now to be seen, thinks he might have lived much longer but for a lump or excrescence at the top of the windpipe, which, on dissecting him, he found to be composed of grass and tow. This is the same bird that was known and recognized, in the early years of octogenarians in this and the neighboring parishes, by the name of "the old swan of Dunn."—*Montrose Review*.

LARGE TURNIP.

THIS is the age of large Turnips, Mammoth Beets and Big Apples. Mr. T. Curtis of Monmouth, has left in our office a turnip, of the white Norfolk variety, which weighs twelve pounds, and measures two feet six inches in circumference; This is only a fair sample of his crop; he states that he had one which measured three feet in circumference; but it absconded one day from the yard. Probably it felt too large to stay any longer with turnips of smaller dimensions.—*Maine Farm*.

A HUMAN TEAM.

A NOVEL spectacle—and, we may add a moving one—was witnessed in this place ten or twelve days since—exemplifying in one of the strongest points of view a state of bodily degradation most painful and revolting to the feelings of human nature. It consisted of a wagon, filled with such articles of furniture, &c. as usually belongs to an emigrating establishment bound for the far West, drawn by two men and a boy, all duly harnessed, acting in the capacity and doing the work of a team of horses! The individuals thus engaged appeared cheerful and patient in the exercise of their laborious employment. They were ascertained to be emigrants from Germany, on their way to the distant regions of the West.—*Guernsey Times*.

From a Poem of ENOCH LINCOLN, late governor of Maine.

"New England's fruitful soil
Requires no culture from a servile toil;
No master's torturing lash offends the ear,
No slave is now or ever shall be here:
Where'er he treads upon our sacred fields
Their Guardian Genius an asylum yields;
His chains drop from him: and on Reason's plan
He claims the gift of God—the rights of man."

NEW ENGLAND SEED STORE,
AND HORTICULTURAL REPOSITORY.

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS, upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country: these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

N. E. Seed Store, connected with the N. E. Farmer Office, No. 51 & 52 North Market-str. GEORGE C. BARRETT.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK IN NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 65 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Peonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

NEW ENGLAND FARMER.

PUBLISHED BY GEO. C. BARRETT, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. XII.

BOSTON, WEDNESDAY EVENING, DECEMBER 4, 1833.

NO. 21.

COMMUNICATIONS.

For the New England Farmer.

NEW KIND OF CLOVER.

MR. FESSENDEN,—I beg leave to introduce to my brother Farmers, the following extract from the code of agriculture, p. 433, as to the new and much-celebrated species of clover.

"It is a subject of astonishment that this valuable plant (the *Tripolium incarnatum*) should not have been long ago introduced into this country (Great Britain) and cultivated on an extensive scale. If sown in autumn, after a crop of potatoes and other roots, it produces the next spring a crop fit to be cut for soiling cattle, eight days earlier than lucerne, and a fortnight before red clover. Care must be taken, however, to have good seed, and not to sow it too deep. It produces two excellent crops in one year, the first of which should be cut as soon as it comes into flower, and the second will produce a considerable quantity of seed. From its early growth in spring, when other articles for feeding stock are so difficult to be procured, it is likely to become a valuable acquisition to British husbandry."

So far we have British authority, to which I beg leave to add, that it has been extensively used of late years in Germany and France, and with much higher commendation. It was the seed of this plant that the Hon. Thos. H. Perkins presented to the Massachusetts Horticultural Society last spring. I have seen no accounts of its success from the members of that society, and therefore feel it a duty to state my own trial of a pound of the seed sent to me by Col. Perkins.

I sowed it about the last week of April. It was in bloom and fit to cut in 50 days. It is not so coarse as Dutch red clover, better furnished with leaves, not liable to lodge or lose its leaves in drying. It furnished a fair second crop in the late uncommon dry season.

From its rapid growth I think it of great value for an early crop, for soiling in summer, or for supplying food when other grasses are winter killed.

It is only an annual grass, and therefore can be of no use but for these occasional purposes; but for milk farms to supply the market, or for small dairies on estates round great towns, I think it promises to be highly useful. I have requested my friend Mr. Perkins, to import 50 pounds, for myself and a friend, and he has ordered a quantity for himself, which are now on their passage. We shall be able to make a more extensive trial next summer, the result of which will be made known.

JOHN LOWELL.

Boston, Nov. 28, 1833.

EXPENSE OF FATTENING PORK, MANURE, &c.

To the Editor of the N. England Farmer.

SIR, I wish to obtain through the medium of your useful paper, information on the following topic.—As I have not a very large farm, I wish to turn every thing to the best advantage. Therefore, I want to know if pork at 6½ or 7 cts. per lb. will pay for fattening when corn is worth from 75 to 80 cents per bushel, as it now is, and potatoes from 25 to 30 cts. per bushel, and other things in propor-

tion. I am aware that the manure, which can be made by 8 or 10 hogs, with suitable yards or pens is of great value; for that reason I wish to feed out my corn and potatoes to hogs, if the pork will nearly pay for the food given to the hogs.

I believe I have seen in some former volume of the N. E. Farmer the quantity of manure which it takes to make a load, but as my volumes are not all complete, I am unable to find it. As I have bought some manure, and mean to buy more, I should like to know the number of bushels that it takes to make a lawful load, or such a load as is bought and sold in the vicinity of Boston, if there is any rule about it. If you, or any of your correspondents will be so good as to answer the above, you will very much oblige one who is willing to do any favor that he can in return.

Yours, with respect, A SUBSCRIBER.

BY THE EDITOR. We do not know how to draw an accurate line of distinction between *keeping* and *fattening* swine. For *keeping* swine, no corn, no grain of any kind is necessary. Dr. Deane observed that "the keeping of swine is of essential advantage to the husbandman; because they feed much on things, which would otherwise be of no essential service to him. They feed heartily not only on grass, but on many sorts of weeds, the tops and roots of fern, [brakes] the roots of several sorts of aquatic plants, &c. They pick up grain and seeds that are necessarily scattered about the barn and out houses, besides eating worms and many kinds of insects.

"Besides the farmer's house affords many things, which contribute to their support, which would otherwise be lost, such as whey, sour skimmed milk, and butter milk, the washing of tubs and dishes; animal and vegetable food, which has accidentally got corrupted, decayed and rotten fruit, the offal of beasts, fowls and fish, and the grounds of cider, beer, and other liquors."

Hogs may be half fattened or more on grass. Dr. Deane observed, "I suppose that one acre of rich land in clover will support twenty or more swine, large and small together, through the summer, and bring them well forward in their growth, but they should have rings in their noses to prevent their rooting out the clover.

"It has been proved by many trials that hogs in such a pasture may be kept in good plight, some say they may be half fattened.

"When it can with convenience be so ordered, it is an excellent piece of husbandry to make a hog pasture of an orchard. Their dung is allowed to be the very best of manure for the trees. They will keep the ground light and loose; destroy insects that infest the trees, and feed heartily on the premature apples that fall, which the farmer is too often tempted to grind up for cider. And the shadow of the trees will be very grateful and comfortable to them in summer. An orchard may be prepared with clover as well as any other spot of ground. But it should be remembered that when the trees in an orchard are young and small, swine should not be permitted to go among them, for there will be danger of their wounding them, and stripping off some of the bark.

"The feeding of store swine constantly with any kind of corn seems to be too expensive. Pos-

sibly it will be found upon farther trial, that carrots are the best substitute. Red beets are also a good food for them, and parsnips excellent. But turnips and cabbage are improper."

We believe that more than four fifths of the food which a hog will consume from the time he is littered till deposited in the pork barrel, if kept with economy, by a farmer whose premises are not overstocked with swine, may consist of what no other animal would eat; and that in an orchard swine are of such benefit that they would much more than pay for their keeping, if no use could be made of them after the season was over. And a great deal of unripened corn, and other offal, can in no way be so well disposed of, as to apply it to the keeping and partly fattening of swine. But to shut up store hogs, and buy corn to fatten them, we believe would be a loss to any person who would make the experiment.

With regard to what is a "lawful load of manure" we are not aware that any definite idea is affixed to the term. Farmers, in general, we believe, understand by a *load of manure* as much as will fill, "*heaping full*" a common cart body. Manure, however, like wood, is often, if not always, bought by the cord, 128 cubic feet to a cord. If there is any rule, or common practice with regard to the measure of manure different from these, we would thank our friends or correspondents for information on the subject.

From the Genesee Farmer.

ON MANURING FALLOWS FOR WHEAT.

We are always gratified to obtain the views of practical farmers on any parts of their business, especially where the contributor differs from the common practice around him,—for whether he is right or wrong, if he makes careful experiments he is on the high road to knowledge; and may elicit something valuable from others. It is therefore with pleasure that we lay before our readers, some extracts from our correspondence.

"The result of a series of experiments for more than ten years have satisfied me that a very great error prevails among farmers with regard to the spreading of barn-yard manure preparatory to seeding it in the fall with wheat. Many haul it out and leave it lying in heaps for weeks, and only spread it immediately before the plough. The best plan is to haul, spread, and plough under in the same day; but this course is impracticable, unless the farmer has more teams and hands than would be profitably employed the rest of the year. The next best course is to haul, and spread off the wagon, or directly after it; and not to suffer the manure to lie in small heaps over night. The custom is to take out all the manure before any is spread. On the contrary, I have pursued my plan for years, and have not seen any difference in the crop, whether the manure had been spread three weeks, or only one day before it was ploughed under.

"After manure is disturbed, and then thrown into heaps, fresh fermentation takes place, which I presume is not the case when it is thinly spread over the ground. I am an unbeliever in the doctrine that the nutritive parts of manure, constituting the food of plants, is exhaled. Some say

that after barn-yard manure has laid in heaps for some time, and become dry, it loses its strength. This has been my experience; but never has this loss happened to manure thinly spread over the field as it was hauled from the yard: in other words fermentation is injurious, but simple exhalation is not.

"Some may think that spreading manure off a wagon is more tedious than to throw it down in heaps, and then spread it. We mostly spread it directly off the wagon. A man and boy hauled out and spread in this manner eighteen two-horse loads, between ten o'clock in the morning and sunset, which it must be admitted was good speed. If the time occupied in throwing it down in heaps be added to the time necessary for spreading it afterwards, a balance will be found in favor of my method. This is not idle theory, but the result of experiments on a large scale."

FRANKLIN INSTITUTE.

From the last report of the Committee on Premiums and exhibitions of the Franklin Institute in Philadelphia, we extract the following portions which relate to the several New-England States.

Boston Weekly Messenger.

On Cotton Goods.—Premium No. 63, is due to the Bristol Print Works, Rhode Island, for No. 55, 10 pieces furniture chintz; the colors in these goods are vivid and the patterns showy. In this article, the judges are of opinion, there is an evident improvement.

Premium No. 64, is due to the Merrimack Manufacturing Company, Lowell, Massachusetts, for No. 263 and 264, 30 pieces rich chintz prints, of superior excellence in style, and displaying colors of great brilliancy.

Woollen Goods.—Premium No. 81, is due to the Great Falls Manufacturing Company, Somersworth, N. H. for 244 and 245, 6 pieces blue cloths, at three dollars per yard. These goods are pronounced to be well made and well finished.

Premium No. 92, is due to the Buffalo Woollen manufacturing Comp., Buffalo, N. Y. for No. 524, Wilton super Blankets. These are not surpassed by any article of blanketing which have ever been seen by the committee of judges; the whiteness and fleecy character of the fabric deserves especial notice.

Premium No. 82 is due to the Great Falls manufacturing Company, for No. 239, 240, and 242 fancy colors broadcloths; the dye is adjudged to be good, the texture fine, and the finish free from objection.

Premium No. 83 is due to Sam. Slater & Sons, of Webster, Mass. for drab and mixed cloths. These goods, are highly commended for color, texture and finish.

Honorary mention is due to the Middlesex manufacturing Comp., Lowell, Mass. for No. 238, striped cassimeres, which for closeness of texture and neatness of finish are highly commended by the judges.

Honorary mention is due to Salmon Falls Manufacturing Company, New Hampshire, for No. 387 and 388, 7 pieces Brown Cloths. These goods are highly commended by the judges for lustre and richness of finish; they say they have examined them with satisfaction and commend them with great confidence.

Carpets.—Premium No. 87 is due to the Lowell Carpet manufacturing Company, Mass., for No. 29, 3 pieces Superfine Ingrain.

Honorary mention is due to the Lowell Carpet manufacturing Company, of Massachusetts, for the very rich display of Wilton Rugs; these exhibited a very great improvement in this branch of manufacture.

Straw Bonnets.—Honorary mention is due to Mehitable H. Sears, of Prescott, Mass. for No. 492, a specimen of Leghorn Braid for Bonnets; this is commended by the judges as worthy of high praise.

Hardware.—Premium No. 25 is due to Isaac Babbet of Taunton, Massachusetts, for No. 61, 12 specimens of Tinned Cast Iron Hollow Ware. The judges are of opinion that these are equal to any thing of the kind they have ever seen imported.

Premium No. 30 is due to Holmes, Hutchkiss, Brown and Elton, of Waterbury, Massachusetts, for several bundles of Brass and Copper Wire: these are reported by the judges to possess all the qualities of a good article.

Honorary mention is due to David Bassett, of Derby, Connecticut, for No. 44, 25 Screw Augers. These are an excellent article, and to every appearance of a superior quality; the workmanship reflects credit on the manufacturer.

Honorary mention is due to J. M. & W. H. Scoville, of Waterbury, Connecticut, No. 124, a specimen of Plated Metal. This is pronounced to be an excellent article; it can be made as cheap as the imported, and in sufficient quantities to supply the demand.

Honorary mention is due to Rockwell & Hensdale, of Winchester, Connecticut, for No. 284, 9 Scythes; these are a specimen of good workmanship and equal to those imported.

Honorary mention is due the proprietors of the "Mill Dam Foundry," near Boston, for No. 474 to 476, 7 dozen Plane Irons, to every appearance a first rate article; the judges express a hope that all Planes hereafter exhibited may be finished with American manufactured iron.

Honorary mention is due to Robinson Jones & Co. of Attleborough, Massachusetts, for No. 368, one case of Gilt Buttons; this is a specimen of well finished goods, and of superior gilding.

Philosophical Apparatus.—Honorary mention is due to Josiah Loring, of Boston, for three Globes deposited in the exhibition: of two of these it is remarked by the judges, that the execution of the maps is good; their covering of varnish remarkably smooth and transparent, and the mounting generally well executed; the third with an "ivory surface" is particularly commended.

Lamps.—An extra premium is due to the New-England Glass Company, Boston, for the Glass Mantel Lamps. The cut pillars, icicles, and other pendulous ornaments, of these splendid Lamps, are the first of the kind presented to the public from American sources, and they bear a strict scrutiny for transparency, lustre and workmanship.

China, Glass and Queen's-Ware.—An extra premium is due to the Boston and Sandwich Glass Company for No. 216, various specimens of pressed Glass; these the judges think have very considerably improved since our last exhibition.

DISEASE IN CATTLE.

We hope some of our readers will be able to furnish us the information desired in the following extract of a letter from Raisinville, Michigan:

"A disease is raging in this vicinity called the Black-tongue, the same which spread over western New-York in the year 1820, and carried off very many cattle and horses. Being young at that

time, I do not recollect the most effectual remedy then recommended. If some one of the many able contributors to the Farmer, will give the course of treatment then successfully pursued, they will confer a favor which will be most gratefully received by hundreds whose cows furnish one half of their support during the winter season."

Genesee Farmer.

From the Genesee Farmer.

THE AMERICAN HAZEL NUT.

I have cultivated the *filbert* for eight or nine years; and never having had one tea-cupful of nuts in the whole time from several large bushes, I have come to the conclusion that this kind of culture is unprofitable. The barrenness appears to be caused either by intense cold in the winter, or by severe vernal frosts. I am aware that some others have been more successful; but in no case that has come to my knowledge, has the owner had nuts enough to pay the interest on the first cost of the tree, to say nothing of extra charges, rent of land, or subsequent cultivation.

We may understand something more of this matter by considering that the tree is a native of milder climates; and that its catkins being pendant, are exposed the whole winter.

I have therefore turned my attention to our indigenous species of *Corylus*, inured and adapted to our weather,—fruit of which for the first time in my grounds, has been produced this season. The prospect of their productiveness is very encouraging.

Naturally, the American Hazle Nut grows in heavy or cloggy soils; and into such it may be best to transplant it. The beaked hazel nut (*C. rostrata*) is also a native, and deserves a trial.

A PRACTICAL GARDENER.

From the N. Y. Farmer.

SUGAR CORN, OR INDIAN ROASTING EARS.

We have received from Capt. Henry Crowell, a sample of the above Corn, which is highly esteemed by the Creek Indians, from whom the seed was originally procured. The corn grows as stout, and the ears and kernels about the size of the common white or cream colored corn, cultivated in this state; but the kernels may be easily distinguished by their semi-transparency. On account of the softness of the kernel this corn cannot be ground into meal. It is used principally for roasting ears. But we presume it would be superior to the common sort for horses and hogs, by being softer and sweeter; and it is said to yield more abundantly, each stalk having several ears. We hope that a fair trial may be made of it the ensuing year.

We are told that the Indians have frequently the luxury of green corn the year round. The corn is pulled when in the milk, and boiled with the shocks on, and in that condition hung up to dry. When wanted for use, the husks are stripped off, and it is boiled again, with a small piece of bacon or dried venison.

The above is a different variety from the sugar corn procured at the seed stores.

From the Farmer's Register.

TO PREPARE COLD POTATOES.

Some of your readers may start, and ask, "Who don't know how to warm cold potatoes?" Why, a great many don't know how to do it as it should be done. In travelling, I have rarely met with potatoes prepared in the following manner, and I

never found any that were half as good. Tastes differ I admit, but the experiment is easily made.

Slice them into a frying-pan; and over a quart of potatoes, pour half a tea-cup full of good cream (but no water,) first sprinkling on a little salt. Cover it closely; and after it begins to boil, stir them a few times, till the pan is nearly dry, but not burnt. Then dish them. Y.

INDIAN CAKES, OR PONE.

For making Indian Cakes.—To one quart of milk add three eggs—beat them well—then add as much meal as will make a batter of the same consistency as is used for buckwheat cakes, pour it into a bake-kettle, and bake as for other cakes. When sour milk can be had, it is to be preferred, into which put some pearlash as for making biscuits.

When cakes are made according to the above directions, most people prefer them to wheat bread, and no doubt they are more healthy. They should be eaten warm, and with a cup of coffee make an excellent breakfast. In addition to all other recommendations, they are—economical.—ib.

RECEIPTS FOR USING RICE FLOUR.

To make Loaf Rice Bread.—Boil a pint of rice soft, add a pint of leaven, then three quarts of the flour, put it to rise in a tin or earthen vessel, until it has risen sufficiently, divide it into three parts, then bake it as other bread, and you will have three large loaves.

To make Journey or Johnny Cake.—To three spoonfuls of soft boiled rice, add a small tea-cup of water or milk, then add six spoonfuls of the flour—divide it into small cakes, and bake them in a brick oven.

To make Wafers.—Take a pint of warm water, a tea-spoonful of salt, add a pint of the flour, and it will give you two dozen Wafers.

To make Rice Puffs.—To a pint of the flour add a tea-spoonful of salt, a pint of boiling water, beat up four eggs, stir them well together, put from two to three spoonfuls of fat in a pan, make it boiling hot, and drop a spoonful of the mixture into the fat, as you do in making common fritters.

To make a Pudding.—To a quart of milk, add a pint of the flour, boil them to a pap, beat up six eggs, to which add six spoonfuls of Havana sugar, and a spoonful of butter, which, when well beaten together, add them to the milk and flour; grease the pan it is to be made in, grate nutmeg over the mixture, and bake it.

Another.—Boil 1 pint of milk, mix a table-spoonful of rice flour with a little cold milk, stir it in while the milk is boiling, afterward add a small piece of butter, 5 eggs, 1 nutmeg, 1 glass of wine, the juice and peel of 1 lemon, and sugar to your taste.

Rice Flour Sponge Cake.—Made like other Sponge Cake, except that you use three quarters of a pound of rice flour, 13 eggs, leaving out 4 whites, and add a little salt.

Rice Flour Blanc-Mange.—Boil 1 quart of milk, season it to your taste with sugar, rose or peach water. Take 4 table-spoons heaping full of rice flour, mix it very smooth with cold milk, add this to the other milk while boiling, stirring it well. Let all boil together about ten minutes, stirring occasionally, then pour it into moulds and put it by to cool. This is a very favorite article for invalids.

Rice Griddle Cakes.—Boil 1 large cup of whole rice quite soft in milk, and while hot stir in a little flour, rice flour, or Indian meal; when cold,

add 2 or 3 eggs, and a little salt. Bake it in small thin cakes on the griddle.

Besides the above, it is good for children; and it may also be used for thickening soups, custard pies, &c.

The article may be found for sale in small kegs, or buckets of 50 lbs. at the Rice Mill, South Boston. Orders left in Box in the area of City Hall. Warranted sound and pure.

THE "FALLING STARS."

The atmospheric phenomenon, which excited so much admiration on the morning of the 13th, is now known to have extended West as far as Maysville and Louisville in Kentucky—to Cincinnati in Ohio—and to Aurora in Indiana, 30 miles distant from Cincinnati. The Cincinnati Republican describes it as presenting at one period a "perfect shower of fire." The meteors were visible from 3 o'clock to day light—and so they were at Aurora. The Maysville Eagle represents them as "a perfect shower of meteors" and as "a storm of fire." We have heard of their being seen as far South as Savannah and Augusta. The Augusta Courier speaks of it as a brilliant shower of meteors, which began at 2, and was visible till day break. Capt. Dixey of the Susquehanna states that these falling stars were seen at the distance of 130 miles from the coast!

CONSUMPTION.

Our attention has been called to the weekly report of deaths, in this city, from the 25th October to the 2d instant, the whole number of which was 113. Of this number there were no less than thirty-four of that insidious and terrible disorder, consumption! Is there no way to check its ravages? There is one, certainly, worthy of much consideration. It is well known that in cold and wet weather, men prepare themselves for the worst. They are thickly clad at all points, and their feet are ever guarded by boots and overshoes,—while on the contrary, women expose themselves in slight dresses and thin shoes, let the weather be ever so inclement. As most of the deaths by consumption are of females, and the fact we have stated in regard to their dress is notoriously true, it is fair and just to conclude that this disorder is by that means contracted. Let females then be more guarded against exposure to the weather, and our bills of mortality will be sensibly diminished.—N. Y. Com.

ADDRESS OF MR. EVERETT.

The Hon. Edward Everett, (says the N. Y. Advertiser) delivered an introductory lecture before the Mercantile Library Association, at Clinton Hall last evening. The room was crowded to excess, and hundreds had to leave, being unable to gain admittance. Like every thing of the kind from this distinguished gentleman it was a most finished production; and was not only listened to with delight, but with frequent tokens of approbation. The speaker gave a very interesting history of the cultivators of the soil, in ancient and modern times; and contrasted the advantages of this most important branch of industry in this country, with that of Europe at the present time. He showed an intimate knowledge of the condition of man in a civilized and uncivilized state; and closed his remarks with a brief account of the discoveries that had been made, and new channels of commerce opened, by the merchants of this country since the Revolution. He paid a handsome tribute to their liberality, intelligence and fidelity.

OREGON EXPEDITION.

We learn that Mr. Nathaniel Jarvis Wythe, the captain of the company of adventurers, who went from Cambridge about eighteen months ago, to the Pacific Ocean by land, has returned to his native town in good health and spirits, and wiser than when he left home; and we are glad to see his heavy teams of ice passing again, incessantly night and day, through Cambridge to the wharves of Charlestown and Boston for exportation. This is just as it should be; and is much better, in our opinion, than roaming over a sixth part of the globe to kill animals, merely for the sake of their skins. To transport water in the form of ice, to refresh the inhabitants of hot climates, has something benevolent in it, compared with the cruel occupation of hunting an animal to death for his skin. We can wish success to the one occupation with a good conscience, which is hardly the case with the other.

Capt. Wythe has brought with him two young Indians of the Flathead tribe, two boys handsomely dressed, and well behaved.—Boston Courier.

A FAT SHEEP.

The Ontario Repository states that a sheep was slaughtered lately by Mr. Josiah Sutherland of Canandaigua, from which was obtained forty seven and a quarter lbs. of tallow. The wool from this sheep after being cleansed weighed six and a half lbs.

INTERESTING FACT.

The Rev. Mr. Roberts, of Bristol, England, in his visits to prisons in that country, from time to time, has fallen in with many convicts under sentence of death. In 167 instances he inquired of the malefactor whether he had ever witnessed an execution? It turned out that no fewer than 165 of these offenders had been spectators in the crowd, upon these melancholy occasions, which the legislature designed to operate as warnings to the profligate. So much for the "efficacy of sanguinary examples" in deterring from crime!

GREAT TURNIP.

They are bragging all over the country about their big beets, prodigious potatoes, and mighty mangel wurtzel; and as we don't like to be behind our neighbors, we shall now celebrate a tremendous turnip, raised by E. H. Derby, Esq. of Salem, measuring 2 feet 6 1-2 inches in circumference, and weighing 7 3-4 pounds. What renders it most worthy of notice is, that the seed from which it was raised, was also raised the present summer, and was sown so late as the 26th of July last. The turnip is at Mr. J. M. Ives' bookstore.—Salem G.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUIT AT THE MASS. HORT. SOC. ROOMS.

Saturday, Nov. 30, 1833.

Apples. By Mr. S. Downer, Dorchester, a Pippin of fine sprightly flavor—name lost. Also, Brussels' Pippin.

Pears. By Mr. Downer, brown St. Germain. By E. Vose, Passe Colmar, melting and fine.

NOTICE.

The Committee on Fruits, Fruit Trees, &c. are requested to meet at the Hall of the Society on Saturday the 7th instant, at 11 o'clock, to award the premiums for the past season. A punctual attendance is requested.

ROBERT MANNING, Chairman.

From the Genesee Farmer.

FARMING OPERATIONS.

As an account of the produce of an acre of wheat raised by me, which was fifty-one bushels, has gone the usual round in the Agricultural papers, I will give you the result of an experiment made upon an acre in an adjoining field which was sowed with another variety of wheat (the Indiana) and which we have recently threshed, the produce of which was, *fifty-six bushels*, of the first quality of wheat weighing sixty pounds to the bushel.

As I have long been inquired of, respecting the preparation of the land, I have to remark that there was no artificial stimulant applied to the land in the form of manure.

A part of the acre first noticed had been enriched by cattle lying upon that part of the field, but the one now spoken of had not even been thus manured. The whole field of twelve acres, has been under cultivation forty years, and during that period, there has not been twenty loads of manure put upon it. The quality of the land is that of the most of our high lands upon the summit of the hills east of Bristol hollow, but is not what has heretofore been considered as our best quality.

The timber with which this land was originally covered was Black Walnut, Butternut, Oaks of different varieties, Hickory, Ash, &c. The three former were the prevailing kinds of timber. I came into possession of this land fifteen years ago, at which time it appeared rather sterile, having been much worn by cropping and bad husbandry. The three years preceding this crop of wheat it was pastured. In June 1832, it was ploughed as deep as the ploughs in common use would turn the furrow. In September it was well ploughed twice, and thoroughly dragged between each ploughing. On the twentieth of September a little short of five pecks of Indiana wheat was sown to the acre, which I procured from Mr. J. Lake of Greece, Monroe County, and the result was as above stated.

I have also raised this season a fine crop of potatoes, which have yielded abundantly. They were of the Ox noble, Pink eyes, Meshanacs, or Mercers, Merinos, Red, White, and Blues of different kinds. The Ox nobles and Merinos, have been the most productive; but the Mercers were first at maturity. The Pink eyes and Reds I consider best for the table. Of the Ox nobles we gathered five hundred and eighty bushels, from one acre. We dug one which weighed four pounds and ten ounces.

The land on which the potatoes grew had previously been pastured, was turned over in the spring, rolled and dragged, and planted at the distance of three and a half feet one way by one and a half the other.

Now Mr. Editor, I venture to affirm that had we not been conversant with the 'Farmer' or some agricultural paper, I should have been deprived of the satisfaction of presenting the public with the account of such rare crops, and you with this detailed account of them, which is not a little favorable to the character of your paper, as it is to your editorial labors that I owe at least some portion of that knowledge and skill, which has aided me not a little, in the production of these superior crops.

I cannot here refrain from expressing my surprise and regret, that so few of our Farmers read agricultural papers, and I cannot resist the belief, that did they but know, and duly appreciate, the

value of those papers, and the actual interest they have in them, not a Farmer who occupies fifty acres or even twenty, would cultivate so small a patrimony without seeking aid, and assistance through some of those papers, which are wholly devoted to the advancement of his interest, and the improvement of his agricultural operations.

I have induced a few of our neighbors to become subscribers to your useful paper; yet there are many more, who have better farms, richer lands, and are at any rate, in their own estimation better farmers than myself, and yet with all these advantages, I challenge any one of them, without change of practice, to produce such crops as I have raised this season; and I attribute my success in no small degree, to the change of practice in my farming operations induced and aided by knowledge derived from those papers. Speak to them of an agricultural paper, and they startle at the suggestion, and often retort with spirit against "book farming." I am in the regular receipt of three Agricultural and Horticultural papers, which I conceive to be infinitely more to the advantage of my farming operations, than the same number of barrels of whiskey would be, although they do not cost one quarter as much; yet there are those who prefer the latter and reject the former.

W. T. CODDING.

Bristol, Ontario co. N. Y. Oct. 25, 1833.

ED. GEN. FARMER. When we reflect upon the impositions that have been practised upon farmers, by the numerous publications which have been issued, by those who were unacquainted with the practical operations of agriculture, we are not surprised at the indifference which they manifest towards encouraging agricultural papers, and only wonder that in a few years such a change as already manifests itself should have been effected. Books have been published with imposing titles, and papers have been issued by those that had no farther interest in common with our farmers, than to secure their subscriptions, and have been edited by those who were as ignorant of the subjects they were writing upon, as they are of the course of tillage practised by the Chinese. They resort to foreign publications for authority, and recommend to their readers whatever they find there put down, whether calculated to facilitate, or retard, our own peculiar course of improvement. It will not be until practical men devote their time to writing, that these prejudices can be done away, neither is it right they should be.

CURIOUS RESULT IN POTATOES.

WILLIAM A. MINCHIN, Esq. of Belville, county Dublin, has left at our office, for the inspection of the curious in such matters, four potatoes growing from one common stalk, two of which are large red apples, and the other two large pink eyes, each exhibiting their original characteristic appearance, though derived from one common parent. Capt. Minchin endeavors to account for the seeming phenomena by stating the fact, that before the planting they cut a few apples and a few pink eyes right across, and joined half of one species to half of another, by means of a skewer ran right through the centre of both, in which state they were placed in the earth. To us it would appear that by this or a similar mode of engrafting, the pink eye might have been first derived from a mixture of the apple and white, but that the character of each should be preserved distinct, as in

the present case, seems a little extraordinary.—*Dublin Evening Mail.*

From the American Farmer.

ON THE SELECTION OF SEED CORN.

Now is the time for those who may not be done gathering corn to select their seed ears. It has long been the judicious practice of many farmers within my knowledge, to select their seed corn from the best bearing stalks. Many other farmers consider this practice as idle, and some sneer at it; but they only betray their want of observation; every attentive gardener is well aware of the advantage of selecting the best seeds—and how many farmers are constantly in quest of the best variety of wheat. Now, of all the grains we know of, corn mixes its kinds with the greatest facility. The natural effect of this is, that the varieties of corn are almost infinite—and hence the need for selecting your seed corn is vastly greater, and more palpably manifest than for selecting any other seed grass.

Those who sneer at a farmer for selecting his seed corn, must be under the impression, that the corn in a field is all of precisely the same kind, and that one stalk's bearing three ears, another two, and a third but one, is the mere effect of accident. But this cannot be the fact. In passing through a poor part of my field the other day, I was struck with a stalk, and upon examination found five good ears on it. I looked to the next hill—there were two stalks—one had one ear, the other none. I examined many hills around—I found most of the stalks with one good ear, several with two, and one or two with three; but this single stalk, though not larger, had more ears on it than any hill near it, where there was either one or two, or three stalks in the hill. Now, sir, this could not have been the effect of accident; it must have been the effect of breed. I do not believe that you can find a corn field in which there are not twenty different kinds of corn, mixed in endless shades and degrees. What a field then is here every where open to select a choice from. You plant from a stalk that has borne you three ears, it will be most likely to bring you such bearing stalks; not from accident, but because it is natural for like to beget like, and for seed to produce its own kind. I heard a farmer say, the first year he thus selected his seed corn, he produced an increase of twenty per cent. or twenty bushels in every hundred of his crop. The second year the increase from the second selection was not so manifest, nor so great; but his crop still improved; and when he went into his field to gather his seed after three years previous careful selection, he asserted to me, that he found more stalks bearing three ears than he could find of stalks bearing two ears the first season he began to make the selection.

CORNUCOPE.

IMPROVEMENTS IN BRICK-MAKING.

It is well known that bricks for our buildings are often very rough, and quite unfit for handsome walls; two important improvements in the manufacture of this article have been lately made. One a machine for tempering the clay better, and less injuriously to the work-people. The other is a machine for pressing the bricks in a half dry state, which renders them greatly superior to dressed bricks, and less expensive. One of the latter machines is now at work at Handford, and it is expected the other will be shortly.—*English paper.*

From the London Horticultural Register.

ON THE UTILITY OF BURNING CLAY FOR CORRECTING THE SOIL FOR GARDENS.

BY MR. STAFFORD.

Gardener to R. Arkwright, Esq. Willersley Castle, near Cromford, Derbyshire.

Gentlemen, I now send you my promised method of burning clay; and as it has fallen to my lot to operate on that material twenty-two years out of forty-eight, I may perhaps claim some attention from those who may be inclined to correct that material. Nothing can be more unfortunate to the proprietor, and to the person whose lot it is to conduct a garden, when the site happens to be a natural strong clay, and as this so often occurs, it has always given me the utmost concern. Until lately a remedy has been out of the question.

An occurrence, however, took place some years ago, which forcibly convinced me of the important benefit that might be derived from attention to the subject. The instance is this: a Mr. Nightingale near this place, enclosed a piece of ground for a garden, of strong clay, and being acquainted with that celebrated agriculturist, Mr. Tollet, of Betley, Staffordshire, he asked his opinion on the subject, who advised him to let the whole be burnt, which it was done in a few weeks; and a work was completed, I may say, in a few days, that never could, otherwise, have been done in his whole lifetime, that is, he rendered the ground prolific; and I never witnessed better success in crops, than I have done of every crop that has been planted in this composition.

A gentleman who had enclosed a piece of ground of strong clayey soil, some years ago, inquired (through the means of the Gardener's Magazine, I think) whether he could have taken any other method than adding sand, light earth, vegetable mold, and other such like materials, sufficient to have made a garden upon a bare rock; but when (he adds) the whole was incorporated, it still remained a garden of clay.

I was then unprepared to make any answer to such inquiries, but have since much regretted I did not take up the subject at the time. To make a proper calculation of the expense will be attended with some little difficulty, as it will very much depend on the materials used to burn with. Some persons recommend coal; this, however, I condemn, as being of too violent a nature.

When I first came to this place, although the garden had been formed twenty-five years, with most excellent judgment, it was, for the most part a strong clay; and within nine inches of the surface, even the most common articles would not live upon it. No weather appeared to have a good effect upon it. At one time it was covered with water, and at another rendered impenetrable by being too dry. After witnessing the effect on a similar clay, at the place before named, I commenced burning, and in a few days produced a composition three feet deep, equal, if not superior to any soil in this country. The clay is rendered as pliable as burnt chalk, and seems to be possessed of the medium of holding just a sufficient quantity of moisture, and no more: as far as I have witnessed, every thing appears to thrive in it; and I have reason to think, that when clay abounds in peach borders, &c. that very much may be done by way of improving them. As an instance, I last summer applied a quantity of burnt clay to some old peach trees, and on examining their roots in the autumn I found abundance of good young

roots, growing in complete bunches; and I believe, that were these borders composed of three parts of this material, they would not be attacked with those diseases so prevalent in the spring, would be more likely to make their wood with shorter joints, and ripen much better and earlier than they could do in a compost, strongly manured.

My manner of performing the process is as follows:—I throw out a trench eight feet wide, and about three feet deep; into this I place as much small wood or faggots, as will fill the trench to the level of the ground; upon this I place a quantity of stronger wood, such as the roots of old trees, &c. which must be regulated according to the quantity of clay about to be burnt: when the whole is completed, I take the advantage of fine weather to light the fire; when this is done, the whole is covered up with that part of the clay which came last out of the trench, as of course it is the strongest; as the fire advances, more is thrown on the heap, making an embankment with the top soil, and all that part which contains any vegetable matter. As the fire increases, the clay contiguous to the fire is dug up, and thrown on the top, and should the weather prove dry, there will seldom require any addition of fuel. I have often been of opinion that I could add to the mass, until it reached to the height of a garden wall ten feet high.

As the violence of the heat subsides, I spread out the soil, which, from the carbonaceous principles it receives in the process, is rendered in point of richness, fully equal to soot. Indeed, I calculate that the ground so heated will require no manure, for at least four or five years, as every species of vegetable appears to grow much too strong for the first two years, with doing nothing more than giving a slight raking. The clay here, probably, is superior to that in some other places, owing to the quantity of calcareous matter it naturally contains, I conceive a portion of it is converted into lime, in the process of burning.

Burning clay entirely destroys every species of insect and pernicious weed; and on whole quarters, where the process was performed years ago, I have scarcely observed either slug or snail.

I have no doubt, the business might be done with good success and very little expense, where furze and heath could be readily obtained; and as it would take more in proportion to the fineness of such materials, it would tend to enrich the mass in a very high degree. As the price of making up faggots almost amounts to their real value, we have taken the wood direct to the trench, without that process, which has answered very well.

I make it a rule, never to burn more clay on a given quarter, than the space requires to correct the soil, as it would be a waste of labor to remove it from place to place; and as it may be operated upon close to any tree or crop without danger, it is more desirable to perform the operation on the spot. The fire will sometimes require probing, to allow the air to enter; but I never wish to see much smoke escape, as I am certain it greatly contributes to enrich the earth. There will require no particular caution with regard to burning the clay too much; it will be seen, that as the wood consumes, the first course of clay will fall to the bottom of the trench; and this will perpetually take place until the whole of the wood is consumed by the fire, by which time a body of hot clay will have fallen to the bottom: when, to secure suc-

cess, I level down the heap, but take particular care not to break or pulverize the compost—the more this is avoided, the longer it will retain its fertilizing qualities.

Those who have new vine borders to make, could not do better than add to their compost one-third of burnt clay, as the average quantity of rain that falls in this island never properly suits the constitution of vines. I think it would prove an excellent corrector, and prevent those troublesome insects, the wireworms, from injuring the roots of the vine; and the cost, in most cases, would be trifling. I think, too, that it would be well calculated for any thing that requires mulching, for applying liquid manure does not in the least consolidate it. This is, I consider, a great recommendation.

If you think these observations of any importance, you will oblige me by inserting them in an early number. And believe me to be, gentlemen, yours, &c.

GEORGE STAFFORD.

Willersley, July 19, 1831.

TOOTHACHE.

DR. RYAN, a physician of great respectability and extensive practice, gives in the Medical Journal for July, the following statement:—A gentleman who attends my lectures (Mr. Myers of Mewington causeway,) had frequently applied sulphuric acid to his tooth with some relief; but on one occasion, he in a moment of confusion took down the next bottle to his remedy, which contained nitric acid. To his great surprise he experienced immediate relief. Since that period he has not suffered from toothache, though three years have now elapsed. During the last winter, he informed me of the success of this remedy, which induced me to try it, while laboring under the most intense pain from toothache. The effect was immediate, and no pain whatever was induced. I have since used it in numerous cases, and invariably with complete success. In some instances the disease does not return for days and weeks, and in others not for months. The best mode for employing it is by means of lint wrapped round a probe, and moistened with the acid which is then to be slowly applied to the cavity of the tooth, care being taken not to touch the other teeth, the gums or the cheeks. On withdrawing the probe, and inquiring how the patient feels, the usual reply is, 'the pain is entirely gone.' The mouth is next to be washed in tepid water. The acid should be gradually applied to the whole cavity of the tooth, as otherwise a second application will be required before complete relief will be obtained. This remedy may be used when the gum and cheek are inflamed, so as to preclude the possibility of extraction. In cases where the diseased fang remains, and when the caries face the adjacent teeth, it obviates the necessity of extraction in all cases of hollow teeth, which all practitioners declared to be desirable, if possible; and it enables the dentist to perform the operation of "stopping or filling the teeth," much sooner than he can otherwise accomplish. In a word, it will alleviate a vast deal of human suffering, and supersede a most painful operation. It is not a panacea for all disease of the teeth and gums, though a certain and efficacious remedy for the most common cause of the toothache. It will be a valuable remedy for children, delicate persons and pregnant women. It does not accelerate the decay of the tooth to which it is applied.—*Taunton Sun.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 4, 1933.

THE Exhibition of Butter and Cheese, made in pursuance of Premiums offered by the Massachusetts Society for the Promotion of Agriculture, took place at Faneuil Hall on the 3rd inst. We hope to receive the official report of entries, premiums, &c. in season for the next number of the New England Farmer.

FARMERS' WORK.

Management of Milch Cows. Nobody thinks of keeping a good horse without a brush and curry-comb; which are used with as much assiduity and punctuality as the apparatus that composes the toilette of a beauty. But as to neat cattle, some people seem to think it is no matter how *nasty* they are. They tie them up, and of course they must lie down in a chaos of filth which would nauseate any thing but a toad, accustomed to "feed on the vapors of a dunghill." Now this is very wrong as respects neat stock in general, and cows which give milk in a particular manner. No person of feeling would keep a cow in that manner, and no man of taste would eat the milk of an animal forced to live in a way so foreign to her natural habits. A cow is naturally a nice creature. She prefers pure air to breathe, pure water to drink, dry and clean lodging, and if left to choose for herself will rarely, if ever, eat any thing which is not perfectly sweet, clean and wholesome. If forced to deviate from nature in these particulars, she will afford but scanty messes of milk at which pigs would turn up their noses.

"Cows cannot be healthy, unless the insensible perspiration goes on regularly; and this cannot be the case when they are put into wet land, or kept in dirty houses, and no care taken to remove the dirt or matter by which the perspirable vessels or pores of the skin are obstructed. In dairies where the dressing of cows is regularly practised, they are uniformly stronger, and in better condition; are less subject to diseases, and yield more milk, and that milk of very superior quality.

"Cows should be dressed once a day, and on no account should any dung be left on their coats. This operation will not be found difficult when it is regularly practised, and plenty of fresh litter allowed, and their dung often removed, that they may be prevented from lying down on it. Cows thus managed, will be found more profitable than otherwise; and the improvement will be discernible both in the dung heap and in the milk.

"Many persons consider that if cows have sufficient food, it is all that is necessary; but we are convinced from experience—the best of teachers—that however well cows are fed, they will not be found near so profitable as they would be if the care and attention so essential to their cleanliness and well being were duly attended to; while those that are thus taken care of, will be found to thrive even on more indifferent food.

"If the udder and teats of the cow are occasionally washed with warm water, those hard swellings, which are often troublesome, will be prevented, as will also warts and other excrescences to which the udder is subject, without this attention. The udder and especially the teats should be washed immediately before the cow is milked."

—Grazier's Guide.

Winter feeding for Milch Cows. The chief dependence for feeding stock is good hay; but roots, cabbages, &c. in addition are very valuable. Those make an excellent change or rather mixture with hay feeding.

"Cabbages," says the Grazier's Guide, "should be given [to milch cows] moderately, but turnips, unless of the Swedish kind, notwithstanding all that has been said to the contrary, make thin milk and poor butter. Carrots are an excellent winter feed; so is yellow beet, and also mangel-wurtzel, but this must be used cautiously, and never without sweet hay, as it is an astringent, and sometimes, if eaten too greedily, will *hove* or *blast* milch cows.—Potatoes should always be well washed, and baked or steamed, or if ever given raw, must be washed quite clean, mashed, and mixed with good hay, or else they are very liable to bring on the scouring rot. An occasional feed of crushed or bruised oats, or fine pollard, will be very useful.—Oil cake should never be used—it produces greasy, ill scented butter, and has a similar effect on the flesh of the animal."

Some other writers have objected to the use of raw potatoes for feeding stock. Sir John Sinclair asserted that "there is something injurious in the juice of the potato in a raw state, which cooking eradicates, or greatly dispels." The *Farmer's Assistant* also observes, "We never should advise to feed milch cows with potatoes, either boiled or raw; as we have frequently known cows to be greatly lessened in their quantity of milk, by being fed on this root." But, in Mr. Arthur Young's *Annals of Agriculture*, vol. xv, is a detailed account of potatoes being used for feeding cows, together with cut straw, which concludes as follows:

"The result of these experiments was that potatoes occasioned the milk at first to diminish [in cows, which have not been used to them] which may be supposed to arise from the change of food, for it required nearly eight days to accustom the beast to that food, which afterwards augmented their milk about a quart. I also made some observations on the quality of the milk; but it will take up too much time to give my observations on that head in detail. It will be sufficient to observe that the first day, the milk appeared to have less cream, and gave about one seventh less butter than before, and kept in this state about five or six days; after which the milk became thicker, and the cream upon it was in greater quantity, without becoming yellow, the butter was less white, and many people, who tasted of it thought it more pleasant, but that difference was not apparent to me." The quantity given to these cows was thirty pounds raw potatoes, and twelve pounds cut straw *per diem*.

A writer for the New England Farmer, whose communication was published vol. vii, p. 11, gives an opinion founded on experience, in favor of raw potatoes for fattening cattle, but says "as to the effects they may have on milch cows I am not so well informed, although I have occasionally given them to cows about the time of calving, both before and after to stretch their bags."

On the whole, we are inclined to think, that potatoes like apples, green corn-stalks and leaves, and other succulent substances, when given to milch cows, not accustomed to them, in such quantities as to gorge the animals, may injure the quality, and lessen the quantity of their milk. But

* See Art. Potatoes, p. 303.

when fed out judiciously, sparingly at first, and increased by degrees, they will prove a very valuable addition to hay, straw or other dry fodder.

PATCH OF BEETS.

The American Farmer after quite a complimentary notice of Mr. J. A. Kenrick's wonderful Beet, which made its first appearance in our paper, weighing thirty six pounds, four ounces, seems loth to own beat by said beet which never was beaten. Quoth he "We have seen no individual beet equal to it, but we challenge our yankee neighbors to a comparison of patches, if they dare," &c.

We are then informed that Henry Thompson, Esq. raised on a patch of 12 by 36 yards, "five tons 14 cwt. and 3 qrs. of the very best food for live stock, especially for milch cows, from less than one eleventh of an acre. Now this crop is neither more difficult nor more costly to produce, than Irish potatoes. Is it any wonder then that our friend Thompson should have fine cattle? His Devons always look as if they were covered with satin, and he gets a hundred dollars apiece for his calves, which cost him to produce them, little, if any more than would those of common blood. But hearken to his own statement, which he has furnished at our special request, for the edification of our subscribers."

"The mangold wurtzel was planted early in May in drills 2 feet apart, and when well above ground was thinned so as to leave the plants about 6 inches from each other; they were cleaned with a small one horse plough three times, the first turning the earth from the plants, the second time moving it towards them, and the last merely cleaning out the middle; they were afterwards hoed occasionally, merely stirring the earth, for the summer was too dry for many weeds to spring up; the ground was in fine tilth, and measured with rotten dung ploughed under early in the spring. "Total weight of the piece manured, say 12 by 36 yards, 5 tons, 14 cwt. and 3 qrs. of plants perfectly sound.

"My ruta бага are a very fine crop, notwithstanding our dry summer they were sown broad cast on the 24th of July, the ground in fine order and well manured; they were twice hoed and afterwards thinned by hand—not a weed can now be seen in the field, the tops covering the whole surface, and are now growing beautifully."

ITEMS OF INTELLIGENCE.

A series of engagements between the Portuguese contending parties took place in the forepart of October last, in which the partizans of Don Miguel were defeated by the troops of the young Queen.

Capt. Ross, who has been so long absent on an Arctic expedition, and whose supposed loss has been so much lamented, has returned to England, together with his companions in the expedition. They met with a most cordial reception; the Captain and his nephew dined with the King, and were every where honored with the most flattering marks of distinction. An English paper gives the following account of the manner in which the party kept Christmas.

"Capt. Ross and his brave companions suffered greatly during a long time when they were living in snow huts constructed like those of the natives, but they kept up their spirits, and passed their last Christmas day with all the usual observances, except in cheer, having had as a substitute for roast beef and strong ale, a roasted fox and cold water. That they were not destitute of provisions, however, appears from the fact of their hav-

ing brought a large bear as a present to the Zoological Society."

New Orleans, Nov. 14. Yesterday morning from about one o'clock till four, successive meteors in the heavens of unusual size, and fiery appearance, shot downwards to the earth, breaking into several pieces as they fell. Whether it was a phosphoric phenomenon or not, we cannot tell. In ancient times the superstitious would have regarded such exhibition as a presage of war, havoc and revolution; but we now-a-days account for things from natural causes, rejecting miracles as fabulous—aye and impossible.—*Bulletin.*

The Recent Star Shower. An acquaintance informs us says the Germantown Telegraph, that in the yard attached to his house the Stars were at least *knee deep*! Another mentions that he distinctly saw an *exact representation of a sword, and also of a reaping hook!* during the representation.

Union Meeting in Georgia. A large meeting took place at Milledgeville on the 20th ult. the object of which was to counteract the effects of the State Rights meeting mentioned in the Courier a few days ago. A preamble and resolutions were adopted, opposed to the nullifying doctrines. Dr. C. E. Haynes, of Hancock, was chairman of the meeting.

Handsome Present to Mr. Clay.—The townsmen of the city of Albany, presented Mr. Clay a splendid cloak composed of American System material, which was made by Messrs. Releda and Wright, in *four hours*. A. Dean, Esq. in presenting the cloak, alluded to the result of the system of which Mr. C. had been the efficient champion. His reply was happy and eloquent, and drew the warmest expressions of approbation from the thousands who had been attracted to the City Hall to witness the presentation.

GRANT THORBURN.

FORTY Years Residence in America, or the Doctrine of a particular Providence exemplified in the Life of Grant Thorburn, Seedsman, of New York, written by Himself. The above unique and racy work contains, among other interesting matters, an account of Mr. Thorburn's two visits to Boston, and abounds in sketches and anecdotes of Society for the last quarter of a century.

For sale by G. C. BARRETT, N. E. Farmer Office. d 4

SEED OF THE TRUE COCKSPUR THORN.

Being the same as the Hedge of J. Prince, Esq., Jamaica Plain, as yet perfectly free from all insects, and an elegant Hedge—15 years old. One dollar per quart. n20

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug28

BUCKTHORNS.

10,000 Buckthorns of thrifty growth, from two to three feet high, for sale—apply at this office. aug 14

WHITE MULBERRY TREES.

5000 Vigorous and large White Mulberry Trees for sale low—Apply to Geo. C. BARRETT, New-England Seed Store.

NEW ENGLAND FARMER ALMANAC FOR 1834.

JUST published and for sale by Geo. C. Barrett, No. 52 North Market street. The New England Farmer's Almanac, for 1834, by T. G. Fessenden, editor of the N. E. Farmer.—Astronomical calculation by R. T. Paine, Esq. Dealers supplied on liberal terms. oct 9

FARMER'S OWN BOOK.

For sale at the New England Farmer office the Farmer's Own Book or Family Receipts. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 50 cents.

CLOVER SEED.

4000 lbs. Northern Clover Seed,—500 lbs. Southern ditto. For sale at the New England Seed Store, 51 & 52 North Market street. a 14

STEAM RICE MILL, AT SOUTH BOSTON.

THE subscriber having purchased the Patent Rice Machines of Messrs. Strong, Moody & Co. of Northampton, with the exclusive privilege of using them in Boston and a large vicinity, has put them in operation at South Boston, near the Free Bridge. It is well known that rice in its rough state, or with its outer hull on, will keep many years, and that after being cleaned, it is subject (particularly in warm weather) to weevil, and other insects, and is usually put in bad casks—he therefore hopes, by having this article always in a fresh state, in casks of different sizes, to meet with a ready sale. The mode of cleaning being entirely different from any other now in use in any other country, the grain is kept quite whole and very clean. It will be put in good casks of usual size, for export; also in barrels and half barrels, and in bags of 100 lbs. each, (which may be returned;) also, ground into fine Flour, in quarter barrels—it will be delivered in any part of the city, for a reasonable charge, and will not be sold in smaller quantities. Also, the fine Bran, or Flour, so called in the Southern States, being the inner coat of the grain, excellent food for horses, cows, hogs, sheep and poultry—and the outer Hull, a prime article for packing glass, crockery, bottles and fruit, and is believed will prove valuable in making Coarse Paper, will be sold at a low price in large quantities.

This Rice is particularly recommended for whaling ships and others going long voyages, as from being highly polished, and free from dust and flour, and being put into their tight iron-bound casks, it will be free from any insects, until exposed to air.

[F] An Order Box is placed in Mr. Roger's Foreign Letter Office in the area of the City Hall, and a sample of the Rice in several Insurance offices, State street. JOHN PRINCE.

South Boston, Nov. 16, 1833. if

AMERICAN HEARTH RUGS.

JUST received at 414 Washington street, a fresh supply of Hearth Rugs, from the Tariffville Factory, manufactured expressly for the subscriber—they are superior in beauty and fabric to any imported. E. S. BREWER.

N. B. E. S. B. will receive orders to manufacture Rugs to match any carpet. isceptJl nov 23

25,000 YARDS COTTON FRINGE.

JUST received from Philadelphia, and for sale by ELIAB STONE BREWER, No. 414 Washington street.

WANTED.

HERDS GRASS, CLOVER, RED TOP. Of the growth of 1833 and of good quality.

ALSO—Flax and Hemp seed, for which cash will be paid. oct9

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

JOHN SCOTT'S LEGACY.

THE Board entrusted with the management of the fund bequeathed to the Corporation of Philadelphia, by the late John Scott of Edinburgh, "for distribution of premiums to ingenious men and women, who make useful inventions," hereby give notice, that in three months from this date they will award a premium to Adam Brooks of West Scituate, Massachusetts, for an apparatus for—1. Reeling Silk from Cocoons: 2. Spinning or Twisting the Silk: 3. Doubling and Twisting it—all by one operation, provided satisfactory objections to the originality of said apparatus are not made in the meantime. The Members of the Board are.

JAMES MEASE,
ROBERT HARE,
JAMES DONALDSON,
WM. HEMBEL,
WM. PHILLIPS,

To any of whom application for premiums may be made. Philadelphia, Oct. 22, 1833. oc 23-d31g.

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sept 11 cow6w

BRIGHTON MARKET.—MONDAY, DEC. 2, 1833.

Reported for the Daily Advertiser and Patriot.

Unavoidable circumstances prevented us from giving the definite number of Cattle to day; we shall give the best information we could obtain in the afternoon; 2400 Beef Cattle, 200 Stores, 1500 Sheep, and 1500 Swine.

PRICES. Beef Cattle.—The quality of the Cattle at market to day was not so good as they were last week, nor hardly so high prices obtained. We quote prime at \$5 a 5 50; good at 4 50 a 4 75.

Barrelling Cattle.—Former prices were not supported; the barrellers hang back, an indication that they are nearly supplied: we quote Mess \$4 a 4 12; No. 1, 3 50 a 3 58; No. 2, 3 12 a 3 25.

Sheep.—Sales were a little better; we noticed lots as follows; one ordinary at \$1 50; 1 at 1 75, 1 87, 2, 2 17, 2 21, 2 25 and 2 50.

Swine.—Sales were quick, but somewhat reduced; several lots were taken at 4 5-8 for Sows, and 5 5-8 for Barrows; one of 250 at 4 1-2 for Sows, and 5 1-2 for Barrows; one lot of selected Barrows at 5 1-2. At retail, 5 a 6 for Sows, and 6 a 7c for Barrows, according to size and quality.

MISCELLANY.

From the Eastern Argus.

THE SNOW-STORM.*

THE cold winds swept the mountain's height,
 And pathless was the dreary wild,
 And 'mid the cheerless hours of night
 A mother wander'd with her child.
 As through the drifted snows she press'd
 The babe was sleeping on her breast.

And colder still the winds did blow,
 And darker hours of night came on,
 And deeper grew the drifts of snow—
 Her limbs were chill'd, her strength was gone—
 O God, she cried, in accents wild,
 If I must perish, save my child.

She stript her mantle from her breast,
 And bared her bosom to the storm,
 And round the child she wrapt the vest,
 And smiled to think her babe was warm,
 With one cold kiss, one tear she shed,
 And sunk upon a snowy bed.

At dawn, a traveller passed by,
 And saw her 'neath a snowy veil—
 The frost of death was in her eye,
 Her cheek was cold, and hard, and pale—
 He moved the robe from off the child;
 The babe looked up and sweetly smiled.

BONES OF THE GIGANTIC MASTODON,
Improperly called MAMMOTH, found in the vicinity of Nashville; communicated by G. TROOST, Professor of Chemistry, Mineralogy, etc., in the University of Nashville.

MANY conjectures have been formed respecting the first inhabitants of our happy country, and several hypotheses have been advanced to determine their origin. Whether they came from Asia or Africa—whether they were the same race as our present Indians, or whether they belonged to more enlightened races of men. Although these investigations extend, comparatively speaking, over but a short space of time, we are nevertheless quite in the dark, and can only form some probably true conjectures concerning them.

We can, however, speak with more certainty of beings that inhabited this country, during a more remote period of time—beings that are not only anterior to historical record, but perhaps anterior to the existence of man. I allude to some large animals, the remains of which we find at present in several parts of the United States; and, though several species have been found, only one, the largest of them, the gigantic Mastodon, seems to have been peculiar to this country.

I learned accidentally, a few weeks since, that some large bones had been found near Liberty Meeting House, in Williamson county, on the farm of Mr. Thomas Holt. I went immediately to the place, but I was already too late to prevent the mutilation and destruction of these relics. I engaged some men to dig for the remaining portions, and found yet the under jaw bone, and several fragments of other bones. Mr. H. had the kindness to offer me the whole collection, which is

* In the month of December, 1821, a Mr. Blake, with his wife and an infant, were passing over the Green mountain, near the town of Arlington, Vt. in a sleigh with one horse. The drifting snow rendered it impossible for the horse to proceed; Mr. Blake set off on foot in search of assistance, and perished in the storm before he could reach a human dwelling. The mother alarmed (as is supposed) at his long absence, went in quest of him with the infant in her arms. She was found in the morning, dead, a short distance from the sleigh. The child was wrapped in her cloak, and survived the perils of the cold and the storm.

composed of fragments of ribs, the atlas, and several other vertebræ, a scapula, the heads of the humerus, ulna, femur, and tibia, with fragments of the bones; the radius, several bones of the tarsus and carpus, with the meto tarsal, and meta carpal bones, most of the latter entire, as well as some phalanges. On the under jaw bone, the coronoid apophyses are wanting; it has one of its teeth, while of the other, the crown is broken off, and the roots alone remain. I obtained only a small fragment of a tusk, the whole being crumbled to pieces. The parts of the skeleton which are in my possession, are pretty sound, and partly penetrated with hydrate of iron, which makes them very heavy. There seems to be no doubt that the whole animal was there, before it underwent decomposition, as the bones were found in a space of not larger than about twenty feet square; nevertheless, they lay without any order, and it is probable that they were a long while upon the surface before they were buried—which must account for the disappearance of some large bones, as part of the head and pelvis.

The animal to which these bones belonged must have been very old; not only the external thick enamel of the transverse eminences of the maxillary teeth has entirely disappeared, but the whole of these eminences are worn down, so that the crown is nearly flat, and shows itself in four large irregular transverse lozenges, formed by the basis of the before mentioned eminences.

These bones were found about nine miles from Liberty Meeting House, north-east corner of Williamson county, about eleven miles south-east of Nashville. They were embedded in a rich black mould, resting on a stiff, ferruginous loam. I found in the black parts some pieces of ferruginous sand-stone, or rather grains of sand, agglutinated by hydrate of iron. It is a small run or rivulet which carries off the water in the vicinity towards Mill Creek, and is mostly dry. The surrounding country is generally more or less rolling with small hills. The place where the bones were found lies between two elevations. They lie not quite three feet under the surface; in fact, the head of the femur long since projected above ground, and was used in rainy seasons when the run contained water, for a step to cross it, there being a road there also for carts and wagons, which must have fractured many of the bones.

A few years ago, another skeleton, or part of a one, was found not far from the place mentioned above, on the premises of Dr. Webb, near the Harpeth river. It lay about six feet under ground, in limestone. It was discovered by digging for the sinking of a tan vat, and lay in a stiff, sandy clay or loam, in a place somewhat lower than the above-mentioned skeleton. The bones were destroyed by the laborers, except a few fragments, which are now in my possession, and for which I am indebted to the kindness of Dr. Webb. They are the extreme point of a tusk, the crown of a tooth, a small tooth, and some fragments of bones. Judging from this crown, they belonged to a young adult animal; the enamel is not injured; the transverse eminences are perfect, only the enamel of the small tooth is partly worn off. The bones were much altered, and soon crumbled to dust as soon as they were exposed to the action of the air. The tusk is very much of a chalky nature.

I have in my cabinet, another small tooth, which was found near Danbridge, Jefferson county, E. Tennessee. And I am told, a bone of a Mastodon

was found in digging for brick clay, in the brick-yard of Mr. Ament, of our city.

Remains of an Elephant found in Tennessee.—Besides the remains of the Mastodon, we find those of an extinct species of Elephant, called by Blumenbach, *Elephas primo-genus*. It is the real mammoth, at least if our fossil Elephants be analogous to the one found in Siberia. If it be the same, it must have had a different appearance from the living species of the present day; as the one which was found in Siberia, under ice, had a thick coat of wool and hair.

I am indebted to the kindness of Mr. Littlefield, one of the members of our Senate, for a molar tooth of this animal. I cannot say any thing of the situation in which it was deposited. It was discovered after a freshet, on the banks of Green's Lick Creek, a little creek running across the plantation of Mr. L., and falling into Duck River, a few miles below Columbia, Maury county. The tooth is much altered; its enamel is brittle, and has lost much of its original constituents—it being now soluble in nitric acid, under a constant and brisk effervescence.

FRUIT TREES.
 ORNAMENTAL TREES, ROSES, FLOWER-
 ING PLANTS, &c. NURSERY of WILLIAM
 KENRICK in NEWTON, 5½ miles from Boston,
 by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended. Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 300 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chesnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Peonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If] No paper will be sent to a distance without payment being made in advance.

AGENTS.

COMMUNICATIONS.

MISTAKE IN PRINTING.

We are much obliged by the following communication, as we are particularly solicitous to render our paper correct as well as useful. Besides, an error in the piece referred to below, is the more to be regretted on account of the merit of the article in which it appears, a performance of first rate excellence.

For the New England Farmer.

MR. EDITOR, The error of another press was copied into your paper of Nov. 27, in the first column, third page—For

“Fear God and work,”

Read

“Fear God and love work.”

Let the old Germans of Pennsylvania have due credit for one of the most useful lessons ever inculcated upon youth. That is the grand lesson that has made that State beautiful, and her people eminently prosperous and happy.

Fear God and fear work! The error would make it read so. There are too many in our land of tight clothes, stays and corsets, and delicate hands and enervating effeminacy, who like the error better than the amendment. In sloth they lose

“The free habitual vigor of the soul”

Hingham, Dec. 5, 1833.

THE WHEAT FLY.

We left it to be inferred, in our comments upon the communication of Mr. Gorrie, on this subject, that late fall sown grain would probably escape the ravages of this insect. We have now reason to doubt the correctness of this inference. In conversing with a very intelligent Scotch farmer, whom Mr. Loudon has classed among the first of his country, we learn, that most of the wheat in Lower Canada, which is almost exclusively spring sown, has suffered severely from the fly. Our informant states, that he has been familiar with this fly, and carefully noted its habits, for many years; that sometimes the early sown, and sometimes the late sown, is most injured; that the fly which produces the maggot abides but a short time; and that unless the wheat head is then recently developed, or is bursting the sheath, it escapes injury. He thinks nothing will destroy the insect which will not injure the grain. We asked him if he had tried lime? He replied, no. Without being confident of its efficacy, we yet indulge the hope, that lime may be found beneficial, when applied to the standing crop, in the manner we have before suggested.

B.

From the Farmer's Assistant.

PAINTING OF BUILDINGS, &c.

For painting the roofs of buildings, Mr. Patterson, of New Jersey, has, some years since, given the following directions, which have been highly approved, as the best composition known for preserving the roofs of houses; as it is found, that it hardens by time, and is an effectual preventive

against the roof taking fire from the sparks of the chimney.

“Take three parts of air-slacked lime, two of wood-ashes, and one of fine sand; sift these through a fine sieve, and add as much linseed oil as will bring it to a consistency for working it with a Painter's brush. Great care must be taken to mix it perfectly.

We believe grinding it as a paint would be an improvement. Two coats are necessary; the first rather thin; the second as thick as can be conveniently worked.

Painting of wooden buildings, of every kind, is not only ornamental, but the owner is well repaid for this extra expense, by the greater durability which the paint gives to them. The wooden fences also, which are intended to be ornamental, round, and near buildings, should never be destitute of a good coat of paint.

TAR FROM PIT COAL,

—A Cheap Substitute for Paint, for the Roofs of Houses. [From the Farmers' Register.]

I APPLIED to a painter in Richmond last summer to furnish me a bill of paints, &c. for a small building then erecting, who advised me to use what he called coal pit tar, for the roof, instead of paint. I have followed his advice, and am very much pleased with the result. The color produced from the tar is a beautiful glossy dark slate. Time only can determine whether it will be lasting; but I see no reason to doubt it. The tar is obtained from the pit coal in its process of distillation for the production of gas. It cost me in Richmond \$5 50 per barrel of 33 gallons. In Baltimore, where it is manufactured, the cost would be much less.

Frederickshall, Louisa, Sept. 20, 1833.

STEAM CARRIAGES.

We understand from a gentleman who has just passed over the Camden and Amboy Rail Road, that by a very simple contrivance, adopted since the recent accident, the recurrence of a similar event need not be apprehended, as in case of breaking an axle, or even a wheel, the car will be sustained and the progress of the train be uninterrupted. It is by experience only, that we are taught to guard against the accidents to which we are liable in life, and it is the part of wisdom to provide against those accidents, and we are the more safe in reality, on the discovery of a weak point, if we can but apply a remedy.

The application of a preventive in this case will very probably receive the notice of scientific mechanics, and be better explained than by ourselves. We are happy to learn, also, that the troublesome annoyance arising from the sparks and cinders is entirely removed on this road, as well as on the New Castle road, although by a different contrivance.—N. Y. Dai. Adv.

CANADIAN MINE.

THE following very important piece of information appeared in the shape of an advertisement, in the *Christian Guardian* of Wednesday week. The mineral riches of the two Provinces are but little known, yet there is reason to believe they are

abundant. The forthcoming work of Lieut BADELY, whose knowledge as a Geologist and Mineralogist is well known, will, we trust, excite a taste for a study, which, in relation to the wants of the Canadas, stands second to none in point of utility.

A Copper Mine Discovered!!—A valuable copper mine has been discovered at Leith!—the new Town, which is beside Kempenfeldt Bay, Lake Simcoe. The ore has been analyzed by medical gentlemen of York; and their experiments find eighty per cent. of metal!!! Before this treasure was found, one hundred and fifty-four lots were sold;—owing to the convenient, healthy, and splendid situation, Leith must have become the county town, but from this discovery there can be no accurate calculation made of the immensity to which that city shall, in a very few years, arrive!!!

Montreal Weekly Abstract.

From the American Farmer.

GREAT CORN RACE

—FOR One Thousand Dollars, over the Talbot and Dorchester course, in 1834.

This is the sort of sport we like—it is really to our taste. In such contests some ONE may win the prize, but we are confident that, unlike betters on horse races, the losers will all be gainers in the long run. Speed and bottom, say we, to all the competitors, and may they be rewarded for their singular choice in amusements, as was Midas, of old, for his preference in the musical contests of a brace of windy gods—may they each acquire not merely a pair, but a multitude of long ears. By the way, we hope as the Cambridge Chronicle suggests, that it shall be made a condition of the race, that each competitor furnish a statement of his method of cultivation, variety of seed used, &c. &c. for the benefit of the public.

One Thousand Dollars!—Agricultural Sweepstake, for Talbot and Dorchester Counties.

A sweepstake proposed to the Agriculturists of Talbot and Dorchester counties, on one continuous acre, “a parallelogram,” of “Indian corn,” shelled, to be grown the ensuing season.

Measurement of land, and corn shelled, to be attested on oath. Twenty dollars entrance money to be paid by each competitor, on or before the first day of March, into the hands of one of the editors of the Easton or Cambridge newspapers, of which due notice shall be given, on or before said day, to Martin Goldsborough of Talbot, or Joseph E. Muse of Dorchester.

The stake entered shall not be withdrawn unless six shall not have entered, by the said first day of March, in which case all shall be void—nor shall the number exceed fifty.

From the Farmer's Assistant.

BURNT CLAY.

This is a good manure for clay and other heavy soils. In ‘*The Complete Gardener*,’ it is also recommended for light soils. The method of preparing it is as follows:

In the first place, dig your clay in spits of the size of bricks, and let them be well dried in the sun. Take small billets of wood, or faggots of brush, and pile them up in the form of a sugar-

loaf, three or four feet high; then pile your spits of dried clay closely round this, leaving a hole on one side to kindle the fire, and another in the top for the smoke to pass off. Surround the pile again with two more enclosures of the spits of clay, and then kindle the fire. When it has gotten well on fire, stop up the holes with clay, and the innate heat will so fire the mass, that wet clay may be thrown on in great quantities. Care must however be taken, not to lay it on so fast, nor so closely, as to put out the fire, as in that case you must begin anew. By raising a stage round the pile, you may throw on clay till you get it as high as you please. The pile must be watched day and night, till fully burnt.

Farmers possessing clay lands will do well to make experiments of this manure. From ten to twenty loads of it is a suitable dressing for an acre.

From the Bucks County (Penn.) Intelligencer.

WINTER PLOUGHING.

THE editor of the Bucks County (Pa.) Intelligencer, from whose paper the annexed extract is taken, says that "it treats upon a subject which must be interesting to farmers generally. If winter ploughing be an effectual remedy against the ravages of the *wire worm*, it is certainly a valuable discovery, and one which should be made public. Prejudice should occasionally give way to experiment; and if the coming winter should prove auspicious, it would perhaps be well for those who are troubled with this enemy of the husbandman to try what virtue there is in winter ploughing, and make known the result of such trial for the benefit of others."

Various opinions have prevailed in relation to the most suitable time for breaking up the soil, preparatory to a crop of corn. Those who have respectively selected periods in the fall or spring, have imagined advantages peculiar to each time; and different circumstances of soil and climate may occasionally give a preponderance to one or the other. A sward ploughed down very early in the spring may, when put in order, be as favorable for a crop of corn as when exposed to winter frosts. But I cannot believe that the plan of deferring breaking up the sod to a period immediately preceding the time of planting is a good one, as the soil thus managed cannot be in a suitable state to impart nourishment to the young corn, as the decomposition of the vegetable matter cannot be effected under such circumstances until several weeks after the tender blades make their appearance. It is, therefore, left in a situation peculiarly exposed to the ravages of noxious insects.

Last winter, observing several weeks of open and mild weather, unsuitable for threshing, I ploughed up a stiff sward, in a field which had been infested with the *wire worm* for nearly thirty years. The ravages of this insect had even been so great, that not often more than half a crop had been raised on the field during all this time. The ground was ploughed a good depth; say from eight to ten inches. About the middle of April it was well harrowed, and afterwards ridged. I planted about the first of May; and, from the present prospect, I should think the field would average forty bushels of corn per acre; and no *wire worms* appeared. I know not whether success is to be attributed to the time of ploughing; but it is an experiment which, giving a favorable result in one instance, may induce others to examine into

the best means of guarding against this potent enemy to agriculture.

AGRICOLA.

From the Maine Farmer.

POMACE.

I HAVE been not a little surprised to see the refuse of cider making, commonly called POMACE, thrown out from year to year, and left to heat, and cattle and swine go on to it, and leave their droppings, and soon rendered useless except as manure, and indeed not even used as such; but there left to rot. So much of it in heaps actually does an injury to the land where it lays, as all kinds of manure would be found to injure the land if left in large heaps.

Why this waste? Let it be taken from the press and immediately spread thin on the barn floor or any out-building, and fed out to stock in the early part of the foddering season, in small quantities daily, and I have no doubt but a common cart-load is equal in worth to 500 lbs. of hay, then as it passes the cattle, it is certainly good manure. But I have no doubt if ploughed into land, the acid would become thereby neutralized so that it would be valuable on land. All bruised sour apples become very different from what they were before bruised.

Hereafter I hope to see no more of it cast into such heaps to spoil, and even into the highway and ditches; but fed out to stock as above suggested—all kinds of stock are fond of it. Some have intimated, if not ground fine, it is as good as apples, if not pressed harder than people generally have pressed it the present year, bushel for bushel. Care should be taken that it does not heat, for this spoils it for stock.

A. N.

MINERALS IN VEGETABLES.

IN many parts of the East there has long been a medicine in high repute, called *Tabasheer*, obtained from a substance found in the hollow stem of the bamboo cane; some of this was brought to England about twenty years ago, and underwent a chemical investigation, and proved to be an earthy substance, principally of a flinty nature; this substance is also sometimes found in the bamboo grown in England. In the hot-house of Dr. Pitcairn, at Islington, subsequent to this time, there was found in one of the joints of a bamboo which grew there, on cutting it, a solid pebble about the size of a pea. The pebble was of an irregular rounded form, of a dark brown or black color; internally it was reddish brown, of a close dull texture, much like some martial siliceous stones. In one corner there were shining particles, which appeared to be crystals, but too minute to be distinguished even with a microscope. This substance was so hard as to cut glass. The cuticle, or exterior covering of straw, has also a portion of flinty matter in its composition, from which circumstance, when burnt, it makes an exquisitely fine powder for giving the last polish to marble, a use to which it has been applied from time immemorial, without the principle being philosophically known. In the great heat in the East Indies, it is not uncommon for large tracts of reeds to be set on fire in their motion by the wind, as I am told by Captain N——, which I conjecture must arise from the flinty surface of their leaves rubbing against each other in their agitation. These facts cannot avoid presenting to the mind, at one view, the boundless laws of nature; while a simple vegetable is secreting the most volatile and evanescent

perfumes, it also secretes a substance which is an ingredient in the primeval mountains of the globe. —[From "Elements of the Science of Botany as established by Linnæus," an entertaining and instructive work. Martial, in the above extract, means containing iron, and siliceous means flinty.]

VIRTUES OF OLIVE OIL.

AN extraordinary effect of Olive Oil is reported by Mr. Baldwin the British Consul at Smyrna, who observed that among the numerous tribe of oil porters, none were infected with the plague. Led by this hint, he proposed unction of the body with oil to keep off the plague, and the following was the result of the first trial:—In 1792, twenty-two Venetian sailors lived five days with three infected persons, all of whom died; but the 22 sailors, who had been repeatedly anointed with oil, remained free from the infection.—Three Armenian families, consisting of 27 persons, occupying the same floor, closely attended the sick of the plague, but being daily rubbed with oil, were preserved from the infection. The nurses in the hospitals of Smyrna, who attended the sick night and day, have by the same method, been happily preserved from the contagion. After this, the oil was employed in the first stages of the plague at Smyrna, and with the happiest effect. The body was rubbed all over with tepid olive oil. And it was esteemed sufficient to effect a cure. The Caffres, who constantly smear the body with lard or oil, remain free from the yellow fever; and the Esquimaux tribes, who also regale on seal oil, remain also free, and when the plague raged in London, tallow melters and butchers were found exempt. Instead of clogging up the pores, as might be suspected by some, the pores become open, and the oil produces a salutary perspiration.

GRUBS AND BOTTLS.

ON all occasions sweetened water should be the first application, and it should be very sweet, of this they fill themselves so full they are quite clumsy I believe, after sucking one hour, then about five pints of meal or hominy is sufficient to discharge them without medicine, one pint of urine is sufficient, more will kill your horse, a decoction of elder toys, buds or bark one quart, of fish brine one quart. If your horse is eaten through you can smell it in his breath, if so you give the sweet water, and then, in one hour a strong decoction made of white oak bark, one quart; this will close the holes so as to give the other medicine, and may often succeed in saving your horse. Horses are naturally fond of sweets, and were you to give them a good suck once a year and in one hour a mess of hominy, would save you giving him medicine and your horse from much distress, especially your old horses after they rise seven years.—N. Y. Farmer.

From the New-York Farmer.

THE PROFESSION OF A FARMER.

THE North American Magazine, reviewing P't. Lindsley's Address, which we noticed in former numbers of the Farmer, makes the following extract and comments:

"I have long thought that our college graduates often mistake their true path to honor and usefulness, in making choice of a learned profession, instead of converting agriculture into a learned profession, as it ought to be, and thereby obtaining

an honest livelihood in the tranquil shades of the country."

In the praise of agriculture he might have gone further, and extolled it as an occupation at once sublime and useful—which ennobles man, gives peace to his mind, virtue to his heart, placidity to his countenance, and calmness to his passions. Absorbed in the holy contemplation of mute but eloquent Nature, or engrossed in the avocations that give sustenance and comfort to his fellow beings, he is equally blessed in the fruit of his labors, or the fragrance of his meditations.

For the New England Farmer.

**OFFICIAL STATEMENT OF THE EXHIBITION
OF BUTTER AND CHEESE,
MADE UNDER THE AUSPICES OF THE MASSACHUSETTS
SOCIETY FOR PROMOTION OF AGRICULTURE.**

The Committee upon Butter and Cheese, consisting of E. Hersy Derby, Edward T. Hastings, and John Hurd, Esqrs. report as follows:

For Butter there were twenty-one entries.—

12 from the county of Worcester, Mass.

3 from other counties, do.

5 from Vermont.

1 from New York.

The whole quantity exhibited about twelve thousand pounds.

The Committee, after a very careful and critical examination of all the statements made by the several claimants, respecting the number of cows kept upon the farm, the mode of keeping them, the treatment of the milk and cream, the method of churning, in winter and summer, the means used to express the buttermilk, the quantity of salt employed, whether saltpetre or any other substances have been used in the process, the best time for churning and keeping butter in hot weather, the best method of preserving it, in and through the summer and winter, and in what vessels,—Report, that they do not find in any of the statements, a process described, which differs essentially from those given the last year. In all of them *cleanliness* in every part of the process of Butter-making, is considered as very essential; and that for keeping, it is important to have it packed very solid, to exclude the air as much as possible. This was exemplified in one of the lots entered; the butter was in small balls, and well made, and the Committee were of opinion that the same butter properly packed, would have been worth at least 10 per cent. more than at present.

The butter generally was considered of a superior quality to that exhibited the last year.

The lot offered by Richard Hildreth of Sterling, Mass. was considered of very extra quality. The Committee therefore unanimously awarded to him the first premium of Fifty Dollars.

The whole of the lot offered by Luther Chamberlain of Westborough, Mass. the Committee considered very fine—two tubs did not appear to be quite equal to the others in flavor. The Committee, however, had no hesitation in awarding to him the second premium of Thirty Dollars.

William Bachop of Barnet, Vermont, had a very large lot of butter in the hall, but only offered seven tubs for premium. These were examined by the Committee, who after much deliberation, agreed to award the third premium of Thirty dollars to Mr. Bachop, though for some time they were in doubt between the quality of this butter, and that of Mr. Harvey of Barnet, and Mr. Cushing of Woodstock, Ver. the two last being quite equal in flavor, but not quite so well put together.

The premium butter sold at auction as follows:

| | | | |
|-----|----|----|-----------------|
| 1st | do | do | 41 cents pound. |
| 2d | do | do | 41 do |
| 3d | do | do | from 38 to 31. |

There were ten entries of Cheese, old and new, most of them from the county of Worcester, one from Vermont—the whole amount being about 3000 pounds. All the cheese offered the Committee considered of *very good* quality, far superior to any offered at the exhibition last year; and after a full and careful examination they were unanimous in the opinion that both premiums should be awarded. They therefore awarded to Mr. John Mathews of New Braintree, for his lot of prime Old Cheese, the premium of Thirty dollars. And to Mr. Roswell Converse of New Braintree, for his lot of prime New Cheese, the premium of Twenty-five dollars.

The Committee would express their obligation to Mr. Newell A. Thompson who officiated as Secretary, and also to Messrs. Cooledge & Co. who officiated as Auctioneers in selling the Butter and Cheese.

E. HERSEY DERBY, *Chairman.*

Boston, Dec. 4th, 1833.

REMARKS ON NEAT CATTLE.

BY MR. MARSHALL.

1. The head small and clean, to lessen the quantity of offal. 2. The neck thin and clean, to lighten the fore-end, as well as to lessen the collar; and make it fit close and easy to the animal in work. 3. The carcass large, the chest deep, and the bosom broad, with the ribs standing out full from the spine; to give strength of frame and constitution, and to allow sufficient room for the intestines within the ribs. 4. The shoulders should be light of bone, and round off at the lower point, that the collar may be easy, but broad, to give strength; and well covered with flesh, for the greater ease of draught, as well as to furnish a desired point in fattening cattle. 5. The back ought to be wide and level throughout; the quarters long; the thighs thin, and standing narrow at the round bone; the udder large when full, but thin and loose when empty, to hold the greater quantity of milk; with large dug-veins to fill it, and long elastic teats for drawing it off with greater ease. 6. The legs (below the knee and hock) straight, and of a middle length; their bones, in general, light and clean from fleshiness, but with joints and sinews of a moderate size, for the purpose of strength and activity. 7. The flesh ought to be mellow in the state of fleshiness, and firm in the state of fatness. 8. The hide mellow, and, of a middle thickness, though, in our author's opinion, this is a point not yet well determined.

Cattle, as well as horses, have been observed to thrive better in salt marshes than in fresh-water meadows, or upland pastures; and it has been conjectured that the herbs produced by the lands near the sea, are more healthy for herbaceous animals, than such as grow on higher lands. But it is said, that the saline particles with which the earth, as well as its produce near the sea is strongly impregnated, occasions this beneficial change in the condition of cattle; as these salts purge away the foul humors which the beasts have contracted, either by idleness, or by being overheated in labor. As cattle are naturally fond of salt, and if left at their liberty will take no more of it than what is conducive to their health, it is recommended to lay common sea-salt in the fields, for them to lick as often as they please.

OUR CLIMATE.

The completest Meteorological Journal ever kept in this country was that of the late Dr. Holyoke of Salem, which begins with 1786 and continues to the end of 1821, a period of 36 years, and is presented in the same number of volumes of MS. all in the Doctor's neat and accurate hand-writing. It comprises two daily observations, during all this time with the barometer, eight with the thermometer, four of the winds, generally four with the hydrometer, and four of the state of the weather, besides numerous occasional notices of various irregular phenomena. A considerable portion of this valuable record, perhaps the most laborious of any kind ever composed in this country by one individual, has been published among the Memoirs of the American Academy of Arts and Sciences, under the supervision of Dr. Hale of this city. The mean temperature of Salem appears from this Journal to be 45, 5 deg. In regard to the *progressive amelioration of our climate*, it has been generally believed that the progress of cultivation and population has had a material effect, but it would seem this *does not hold true* of the section of the country in question, during a period when these changes have taken place in a very considerable degree. The mean of the first 10 years is 48,27 deg. that of the last, 47,85 deg. The highest year in the whole series is 1793, the lowest 1812. It also appears that the common impression is a mistaken one, that the *Spring* advances more rapidly, in proportion to the rest of the year, than it did formerly.—*Boston Mer. Journal.*

Steamer New-England. The board of examiners, at the head of which was Professor Silliman, appointed to investigate the causes of the destruction of the boat, have reported that the sole cause of the bursting of the boilers was the immense pressure of steam to which they were subjected through the *negligence* of the engineer.

MASS. HORTICULTURAL SOCIETY.

**EXHIBITION OF FRUIT AT THE MASS.
HORT. SOC. ROOMS.**

Saturday, Dec. 7, 1833.

Apples. By Mr. Richards, Rhode Island Greenings,—Marygold, and several other varieties.

By Samuel Pond—an apple for the Spanish Reinette, of the Colville species, and bearing a close resemblance to the White Colville.

By Mr. Manning—Red Doctor or Dewitt of Cox; Michael Henry, do.; Pennock's Red Winter do. do.; Winesap do. do.; Winter Queen do. do.; Carthouse or Gilpin do. do.; Bourassa of Ronald; Pomme Gris do. do.;—Also Ortle, Downton Golden Pippin, Wellington; neither of these two last have yet proved in our climate, what they have been represented by the English writers in their own country—many of our own native fruits, the selections from the innumerable native orchards, proving very superior. Four unknown kinds were also exhibited by Mr. Manning.

Pears. By Mr. Samuel Pond.

By Mr. Richards, St. Germain.

By Mr. Manning, Martin Sec, Angelique de Roine Louise Bonne—Easter Beurre and 3 kinds names unknown.

Fine specimens of Passe Colmar and some other varieties were also exhibited.

WILLIAM KENRICK.

SPONTANEOUS COMBUSTION.

THE dreadful fire at the Custom House Stores, in Ireland, has led to a thorough examination of this curious and dangerous phenomenon, partly by means of judicial investigation, and partly by newspaper discussion. The subject has been taken up by a Mr. Edw. Stephens, in a correspondence with the Editor of Saunders' News-Letter, and treated with considerable ability, and with an array of evidence that puts the reality of such combustion beyond controversy, although he has failed to put an end to all scepticism, as to the cause of the fire in question. The evidence produced, as well by Mr. Stephens as in the course of the judicial inquiry, is sufficient to satisfy us, that many a conflagration which is ascribed to some secret incendiary, is in fact due to the mysterious agency of nature. It may, perhaps, prove useful and interesting to place before our readers, in a condensed shape, some of the information that we have gleaned on the subject, from the sources above referred to.

The fixed oils play a principal part in spontaneous combustion. Philosophers ascribe the phenomenon to an absorption of oxygen, which increases the temperature, and ultimately produces combustion. Linseed oil mixed with lampblack, or with any light kind of charcoal, and with wool, cotton, flax, hemp, or other vegetable substances, after some time, heats spontaneously, and at length bursts into flame. Waste cotton, used to wipe oil from machinery, has been observed to take fire, after having been thrown aside for a few hours; and many calamitous fires in cotton mills, may doubtless be traced to such an origin.—Rags, impregnated with oil, or even laid by in a damp state, are a prolific source of spontaneous combustion, and occasion a danger to be vigilantly guarded against, both in private houses and paper mills. Moisture, without oil, is also an agent of such combustion in vegetable substances; and haystacks, as well as rags, are said to have taken fire from this source.

The Russian Government, in consequence of the destruction of a Frigate by fire in the harbor of Constantinople, in 1781, and of a large Hemp Magazine, in the same year, and of a slight fire in another Frigate, the following year, instituted a very strict examination of the subject. On the occasion of the last accident it was ascertained that several parcels of matting, tied with pack-thread, in which the soot of burnt fir-wood had been mixed with oil, for painting the ship, had been lying for a considerable time on the floor of the cabin whence the fire issued. An experiment was immediately made, to test the sufficiency of such a cause of conflagration. Forty pounds of fir-wood soot were well soaked in about thirty-five pounds of hemp oil varnish, and the whole wrapped up in a mat and placed in a close cabin. In about sixteen hours it gave out smoke, and when the air was admitted, the whole burst into a flame. The experiment was repeated with linen, and smaller quantities of soot and varnish, with the like result. In both instances, the soot was from wood and not coal.

The presence of lampblack, or any other dry carbonaceous matter, is not necessary, however, though it promotes the inflammation. Hemp or cotton, soaked in any farinaceous oil, as rape seed or linseed oil, will take fire, either in hot weather or when closely shut up. In Lincolnshire, in July 1794, a bale of yarn, of 120 pounds, accidentally

soaked in rape oil, remaining in a warehouse, spontaneously burst into a violent flame. Wool, or woollen yarn, dressed with oil, (which is generally rape oil,) is subject to like combustion. This species of combustion is generally preceded by the emission of smoke and of a nauseous smell.

Farinaceous matter of other kinds has been known to produce combustion. Rye flour, parched till of the color of coffee and wrapped in a linen cloth, has been found to become violently hot and destroy the cloth. Wheat flour, when heated in large quantities, and highly dried, has been known to take fire, causing accidents in granaries and baker's shops. An accident of this kind once happened at a flour warehouse in Turin, containing about 300 sacks of flour. It began by a violent explosion on a lamp being brought into the room, and the whole was soon in flames. Charcoal alone, finely powdered, packed close in large quantities, and kept for some time, has been known to take fire in powder-mills. Roasted coffee, chocolate nuts, French beans, lentils, &c. also have the property of inflaming spontaneously.

Moisture without oil, will ignite wool, and inflame cotton. Several tons of wool, collected for export to England in St. John's, (Newfoundland), on which snow had fallen, and into the body of which it had penetrated on melting, gave out smoke, and upon removing the surface to the depth of about two feet, a mass of red fire was discovered. Like instances in cotton rags are numerous. Mr. Stephens concluded one of his letters thus:—"Keeping in view the well known tendency of old damp and unaired linen or cotton rags to heat, scorch, and finally ignite, perhaps the public may arrive without much difficulty at the true cause of the fires in the Custom House Stores. High Sheriff Lynar, who was actually in the free store during the conflagration, declares his belief, and in this he is supported by the police, sub-constables, and the mate of the *Thames*, (who first saw the fire) that it broke out in the first loft, on the spot where it has been ascertained, that a number of bales of linen rags from Hambro' were stored. These had been lying in other parts of the bonded store since 1829; during the last four years, their wrappers had decayed, and the store porters and others wiped their hands unceremoniously on the protruding rags, till at last the manager, very properly, had them removed, for safety, into the place called the "*Sanctum sanctorum*," where the fire found them. If one of them by exposure at a broken window, or otherwise, happened to absorb as much moisture as would at length suffice to promote the destructive heating of the contents, the consequences can easily be calculated without having recourse to the supposition of the hand of an incendiary, wilfully applying the torch.

It is somewhat remarkable, that Sir Edmund Davy, Professor of Chemistry to the Royal Dublin Society, who was examined in reply to Mr. Oldham, of the Bank of Ireland, (who testified to several instances of spontaneous inflammation, within his personal knowledge, of cotton rags employed in wiping the plates from which the Bank notes were printed,) carried his skepticism so far, as to cast doubt on the whole theory of spontaneous combustion.

Public opinion seems not to have been satisfied on the natural origin of the fire, as Mr. Stephens alludes to a large reward just offered for the discovery of the incendiary.—*Charleston Courier*.

From the *Genesee Farmer*.

FATTENING HOGS ON APPLE PIE.

FRANKLIN'S adage, in the mouth of Poor Richard, that "a penny saved is as good as two pence earned," should be constantly in the recollection of the farmer. There is scarcely a plant that grows upon the farm but what may be made to furnish wholesome food to animals or vegetables. To know *when* and *how* to use them, and resolutely to give this knowledge a practical application, constitute one of the most valuable features in good farming. The stocks, the straw, and even the weeds, that waste in the fields, and the urine that is washed from the yard, are as much the natural food of vegetables, as hay and grain is of animals; and if husbanded and properly applied, will make a fair return. But as it seems doubtful whether the present generation, in western New York, can be made to appreciate the importance of economising the food of vegetables, we will state some facts in regard to economising animal food, which we trust may not be unacceptable.

Stephen Titus of New Baltimore, fattens his hogs upon *apple pie*! So he told us to-day. Stephen Titus is of the religious denomination termed *Friends*, a pretty good guarantee for his veracity. But we want no guarantee; for we verily believe all he told us; and as we consider the facts valuable, we will give the narration in detail. I fill a potash kettle, said he, with two parts of apples and one of potatoes, together with half a bushel of Indian meal or bran, and a sufficient quantity of water to boil the mass well. When boiled, I call it *apple pie*. It is then thrown into the swill tub, mashed with a mall, and the butter-milk and sour-milk of the dairy added, when it may be termed *apple pie and milk*. Mr. Titus says he has used apples for years, and with great advantage, in fattening hogs and neat cattle, both in a raw and cooked state; and that he considers an orchard even for these purposes, a valuable appendage to a farm. Friend Titus contrasted his management in this respect, with a neighbor, who had cut down 200 fine Jersey Sweeting apple trees, as cumberers of the ground.

Mr. Titus' is the first experiment with cooked apples that we have heard of; but we don't see why cooking apples may not be an improvement, when given to high fed animals, as well as cooking corn and potatoes. An interesting fact was stated to us a few days since by one of the best farmers of our country, one who has probably collected more important data upon the profits of different branches of husbandry than any other. In a nicely managed experiment in fattening hogs, he alternated for some days with each kind of food, boiled potatoes and meal,—and hasty-pudding. He found that the potatoes and meal made two pounds of live pork in each hog per day, while the hasty-pudding made more than three pounds per day, we think he said $3\frac{1}{2}$ or $3\frac{3}{4}$ lbs. a conclusive evidence of the difference in food, as well as of the importance of having it *well cooked*—for probably the meal was not mixed with the potatoes till after they had been boiled.

We have a word more to add upon orchards. A fanatic zeal has in more instances than one led to their destruction, under the plea that they fostered intemperance! Why not carry the principle through? Cider, especially in its concentrated form of cider brandy, may cause intoxication, and lead to intemperate habits. Rye and corn, by the aid of the distillery, cause the like evils. Shall we

therefore discontinue their culture, because they may be perverted to a bad use? We confess we are fond of good cider, and think apples among the greatest luxuries of life, and their use, in various ways, highly conducive to health. Some eminent moralist has compared men to a barrel of unfermented cider, which, if stopped at the vent, is apt to leak at some other point; or, in other words, that a too rigid restraint upon innocent indulgence may lead to greater evils. We hope the example of Mr. Titus, which we have stated, may stay the hand of the destroyer; and induce those who deprecate alcohol, to convert the products of their orchards into pork and beef.

B.

From the New York Farmer.

PUMPKIN BREAD.

As you have in some of your former numbers furnished us with directions for making Rice Bread, Corn Pudding, &c. I presume you will not take it amiss if I call the attention of your readers to the value of the *Pumpkin*. I presume there is not a vegetable on the face of the earth, more easily raised, or that is more productive; when it is considered that they will grow among corn, potatoes, or on any waste ground, and that the seed of one pumpkin will produce cart loads of fruit.

In the fall of 1829 I obtained the seed of a very superior pumpkin, part of which I planted the latter of June following, on the ground that I had raised two early crops of vegetables from, and comparatively of little value to me at that season of the year. I began to gather some of the fruit in October; it being extraordinary fine, I was anxious to save every grain of the seed, but the difficulty was how to dispose of the flesh or fruit.—The common method of making it up into pies, would have been troublesome and expensive, and I thought them too good to feed swine with. I first gave some to my friends, on condition that they would save the seed, but they did not use them up fast enough; at length my wife tried experiments to work them up into Bread, Cakes, Pies, Puddings, &c. and it was not long before we discovered that they could be used so as to answer every purpose of Indian Meal, and that our family and friends considered it preferable to any thing of the kind made in the ordinary way.

The pumpkin is first deprived of the rind, and afterwards cut up in slices and boiled; when soft enough it is strained in a colander, and mashed up very fine; in this state it may be used up into pies, or mixed with flour for pudding, cake, &c. If it be intended for bread, it may be made up with wheaten flour in the proportion of one third to half. The sponge must be first set in the ordinary way with yeast in the flour, and the pumpkin worked in as it begins to rise. My wife's rule is to use as much pumpkin as will bring the dough to a proper degree of stiffness without water. Care should be taken that the pumpkin is not too hot to scald the leaven. It requires more baking than bread made entirely of wheat. I am aware that pumpkin bread is nothing new, but I am informed that farmers in the country use Indian meal with their pumpkin instead of wheaten flour, which makes it more like pudding than bread. Those farmers that are in the habit of making their bread with wheat and Indian, may find a market for their meal more easily than for pumpkins, and if they use these up into bread precisely in the same manner as they do their meal, I am persuaded

they will find it very wholesome and palatable bread.

Yours, respectfully,

T. BRIDGEMAN.

New-York, Nov. 21, 1831.

From the New York Farmer.

SUPERIOR COMPOSITION FOR TREES.

Extract of a Letter from Hon. J. K. Guernsey, of Pittsford, to Wm. Prince & Sons.

I AVAIL myself of this opportunity to send you the following statement, respecting the Composition for Trees.

Many inoculated trees are greatly injured, and finally lost, in consequence of the length of time necessary to heal over the stock, where it is cut off, when no means are used to secure it from exposure to the air and wet.

The wood dies down to some distance, and although, after a time, bark and new wood may grow over, it finally rots and destroys the tree. The same is true of large limbs cut off, and of bark knocked off by accident. To prevent this, the following cheap and easily applied composition is the best remedy I have found. I have used it for more than 20 years, with almost uniform and perfect success.

Recipe.—One part, say one quart, common tar. Two parts, say two quarts, chalk, finely pulverized, and sifted. Put the tar into an iron kettle; heat it, and whilst hot, stir in the chalk. Care should be taken not to boil it too much, either when first made or when using it, as that will make it too hard and brittle. Should it by accident become so, add tar, till sufficiently soft. When to be used, heat it over either an earthen or iron portable furnace, or fire made on the ground on or near the place where wanted, so as to boil, or to be sufficiently soft, which a little experience will show, and apply it with a small iron or wooden spatula, covering the wood entirely with a thin coat, and leaving no place for the water to get under the composition. It will remain on for years, but may be taken off whenever the bark shall have grown over the wood. It will be found upon examination that there is no dead wood under it. Any one who delights in seeing fine healthy trees, after having once fairly tried the experiment, will never abandon its use. It is particularly valuable for covering the stumps when old trees are headed down. This composition was invented, and an account of it published, by some gentleman either of England or Scotland, I think Sir Arthur St. Clair, soon after Forsyth first published the account of his composition for healing wounds in fruit trees, which is very troublesome to make, and still more so to use. It is, probably, known to many horticulturists, but ought to be known to all who cultivate fruit trees; and if you think the publication of these remarks will be useful, they are at your service.

DISEASE OF POULTRY.

FROM a series of observations made on the diseases of domestic poultry, Mr. Flourens makes the following conclusions:

1. In these animals, cold exercises a constant and determinate action on the lungs.
2. The effect of this action is the more rapid and more severe, the younger the animal is.
3. When cold does not cause acute and speedily fatal inflammation of the lungs, it produces a chronic inflammation, which is pulmonary consumption itself.

4. Heat always prevents the attack of pulmonary consumption; when the latter has taken place, heat suspends its progress, and even sometimes arrests it entirely and effects a complete cure.

5. Pulmonary consumption is never, in any stage, contagious; fowls affected with that disease were not only all day long with the healthy fowls, but at night roosted in the same places, without communicating their disease to them.—*Goodsell's Farmer.*

From the Genesee Farmer.

BLACK TONGUE.

THE celebrated Veterinary Surgeon Richard Mason of Virginia, forcibly recommends the following treatment of this dreadful disease, that is among us, and daily carrying off some of our most valuable Horses.

He recommends the constant use of Gum assafoetida, as a preventive of this as well as other contagious diseases, and says that he owes his success in preventing and curing this disease to the constant use of this drug.

He observes that the value of assafoetida as a medicine for Horses is but little known, but where it shall have been once used its remarkable effects will prove his observations correct. It acts as a stimulant, antispasmodic, expectorant, emenagogue, and antihelmentic, and its action is quiet and penetrating.

Where a small piece of assafoetida has been placed in the manger of a horse which was in health, I have known him to occupy a stable for months adjoining one in which was a horse affected with a contagious disease, without being in the least injured, or any ill consequences resulting from it.

Preventive.—Take one ounce of assafoetida, divide it in two parts, wrap them in clean linen rags and nail one part in the bottom of the manger where the horse is fed, the other in the bottom of the bucket in which it is watered. These will last for three months. A small piece, confined to the bridle bit when the horse goes from home, will also act as a preventive.

Cure when the Disease has commenced.—Take one pint of Castor Oil, two ounces Balsam Copaiva, two ounces sweet spirits of nitre, let these ingredients be well mixed in a bottle and given.

A wash for the Mouth.—Take one pint of vinegar, four ounces of Alum, a piece of verdigrise as large as a common sized bean, and a handful of sage. Let the sage be decocted in a pint of water, and the alum and verdigrise dissolved in it; use this as a wash for the mouth two or three times each day until the disease abates. S.

CAPERS.

THE pickle in common use under the name of capers, is made of the young flower buds of a beautiful shrub found in the Levant and the south of Europe, where it grows wild among rocks and rubbish, and is as common as the bramble is with us.

AN EXCELLENT CURE FOR A SPRAIN.

TAKE two pieces of red flannel, soak one of them with beef or pork pickle, (beef is best,) and place it on the wrist or ankle sprained, wrap the other piece over it, and the pain will subside in a very short time.—*American Farmer.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 11, 1833.

NEW AND IMPROVED AGRICULTURAL IMPLEMENTS, WILLIS'S IMPROVED STRAW CUTTERS, &c.

It was remarked by Sir John Sinclair that "the introduction of new agricultural implements into a district, is often a matter of the greatest difficulty, owing to the ignorance, the prejudices and the obstinacy of farm servants and laborers. Many farmers, therefore, very absurdly retain their old implements, though convinced of their inferiority, rather than sour the temper of their laborers, by attempting to introduce new ones. In many cases, however, they have succeeded by attention, by perseverance, and by rewarding their laborers, who have been induced to give the new machines a fair trial."

The farmers of New-England are too enlightened and have too much regard to their own best interests to be under the dominion of such profitless prejudices. Accordingly we find not only that there is a very reasonable and increasing demand for new and improved agricultural machines, tools, &c. but that the Committees of our Agricultural Societies, not only make honorable mention of such machines, but by awarding premiums give more substantial proofs of the estimation in which they hold such products of well directed skill and inventive ingenuity.

Impressed with these sentiments we were much pleased to perceive by the Report of E. Hersey Derby, and Daniel Treadwell, Esqrs. [N. E. Farmer vol. xii. p. 131] that the march of improvement in this field of invention, keeps pace with its progress in other quarters, and that successful efforts are making to facilitate and render more effectual the labors of the cultivator, which compose the foundation of all improvement, in all arts and sciences.

Among the premiums awarded by the Committee above named was one for WILLIS' IMPROVED STRAW CUTTERS. We shall not give a description of this implement, (which may be seen and purchased at the Agricultural Warehouse, No. 52, North Market Street,) but merely point out, concisely, some of the advantages resulting from the use of a straw cutter.

Mr. Thomas Williamson in a communication to the Bath Society, [England] on the use of chaff, or cut hay for feeding horses, remarks that "one hundred weight of hay was found to yield 20 bushels of chaff, pressed into the measure and piled as high as it could be safely carried; consequently each bushel weighed about 5 1-2 lbs. It was found that five horses would eat 12 bushels of chaff in 24 hours, and that somewhat more than half the usual quantity of food was saved by having it cut."

Mr. Benjamin Hale, formerly proprietor of a line of stages running between Newburyport and Boston, has given a statement, published in the *Massachusetts Agricultural Repository*, vol. 10, p. 400, by which it appeared that the total saving in using a straw cutter nine months, to wit at Newburyport four months, and at Salem five, was \$780 97 cts.

In the Memoirs of the Philadelphia Agricultural Society, a valuable paper was published entitled *Notices for a Young Farmer*, written by Judge Peters, formerly President of that Society. In this the following passage occurs: "cut or chaff your hay, straw, corn tops or blades and even

your stalks with a powerful straw cutter and you will save a great proportion, which is otherwise wasted, or passed through the animal without contributing to its nourishment. One bushel of chaffed hay, at a mess, given in a trough, three times in twenty four hours, is sufficient for a horse, ox or cow. A bushel of chaffed hay, lightly pressed, weighs from 5 to 5 1-2 pounds. A horse, or horned beast thrives more on 15 lbs. thus given, than on 24 or 25 lbs. as commonly expended (including waste) in the usual mode of feeding in racks, to which troughs properly constructed are far preferable."

The celebrated agriculturist, Arthur Young, observed that "the practice of giving hay cut with a mixture of straw, instead of feeding in the common way with hay, is recommended at all events to as great a degree as can be effected, for the saving is unquestionable. Mr. Page of Cobham, in feeding his stock, gives no hay or straw but what has been cut into chaff. At the expense of only £5 he added a mill-wheel to his chaff-cutter, by which means a boy and a little pony cut 20 bushels per hour. This practice he finds so profitable, that he earnestly recommends it.

"For sheep, attention must be paid to the troughs in which it is given, to see that they be so boarded as to prevent the wind from blowing the chaff out: this is effected in Lord Clarendon's sheep yard, in Hertfordshire, by a boarding, which covers the sheep's heads, while feeding in the troughs."

Other authorities might be cited in favor of cutting hay and other fodder for stock, but anything more on that topic, we believe would be superfluous. It is also well known that cattle greatly prefer short straw to long, and by mixing a little barley, oats, or Indian meal with straw, or other coarse fodder, cut about as short as oats, they will eat the mixture with eagerness, when they would reject the coarser parts without such preparation.

The advantages of cutting fodder are that it saves labor in masticating and fitting the food for digestion. Cattle's teeth are not so sharp as the steel of a fine edged tool, and when their food is rendered fine by artificial means, it will be still more minutely divided by the grinders of the animal; and the smaller the particles, the greater the proportionate surface presented to the operations of the gastric juice of the stomach. But theory apart, practice has shown the advantages of these machines; and that more than one third of a farmer's hay, &c. may be saved by their use. And we have reason to believe that *Willis' Improved Straw Cutter* is one of the most valuable of this very important class of agricultural implements.

NEW AND EXCELLENT VARIETY OF WHEAT.

In our paper of September 4, 1833, page 58 of the current volume, were given some notices of a new kind of Spring Wheat, which was originally procured by PAYSON WILLIAMS, Esq. from the shores of the Black Sea. We have since learned that Mr. Williams' crop of this kind of wheat, raised on his farm at Fitchburgh, was very great, amounting to FIFTY FIVE BUSHELS AND THREE PECKS TO THE ACRE! Some of the stalks and heads of this wheat are left for inspection in the New-England Farmer Office, and afford ocular and tangible demonstration that report has not gone beyond reality, as respects the excellence of this article. We hope to have some of this kind of wheat for sale in season for sowing next spring,

and persons wishing to obtain it are requested to send their orders as soon as convenient.

For the New England Farmer.

A MAMMOTH TURNIP.

MR. FESSENDEN,

I observed in your paper of the 4th inst. an account of a "Great Turnip" raised in Salem, measuring 2 feet, 6 1-2 inches, and weighing 7 3-4 lbs.

I send you with this a turnip raised on my place the past season, which measured when taken from the ground 3 feet 1 inch, and weighed 14 lbs. exclusive of tops.

CHARLES BOWEN.

Newton, Dec. 5, 1833.

ITEMS OF INTELLIGENCE.

Congress convened at 12 o'clock on the 2d inst. and chose Andrew Stevenson of Virginia, Speaker, and Walter S. Franklin, of Penn., Clerk.

A Message was received from the President, embracing the usual topics; but as it has probably been in the hands of most of our readers, we shall not attempt its abridgement. This Message was subsequently referred to a Committee of the Whole on the State of the Union.

On the 5th inst. the President of the U. S. returned the Land bill, which passed both Houses of Congress at the last session, accompanied by a long Message stating the grounds on which he had declined signing the bill. The reception and reading of this bill gave rise to a debate in which this proceeding of the President was made the subject of animadversion.

John S. Abbott, Esq. of Thomaston, whose office and library were consumed a few days ago, states in a communication to the Portland Advertiser, that his papers were enclosed in one of "Gayler's patent double fire-proof wrought Iron Chests." During the fire it fell from the second story into the cellar and was exposed to an intense red heat for some hours. The heat was so great as to melt a part of a stove; and the iron key which was left in the padlock, on being touched, crumbled to atoms; yet no paper in it was in the least degree burnt—and not one was rendered illegible.

Coal. Indications of vast quantities of excellent anthracite coal, are said to have been found in Virginia within 12 miles of the Potomac, and in the vicinity of the Chesapeake and Ohio Canal. They are said to reach along the base of the mountains quite into Tennessee.

We commend the following paragraph to the particular notice of some country gentlemen, who do us the honor to exchange papers with the Boston Courier. It is from a paper lately established in the thriving village of Brattleborough, Vt. called the Independent Press. The custom of selling exchange papers, regularly, to individuals, at less than the subscription price, is about as honest as to keep a reading room and furnish it at the expense of other printers.

We have had sundry persons in our office of late, offering to purchase the Vermont Chronicle, the New-England Farmer, the Boston Patriot, &c. &c. at reduced prices. They told us that they had been in the habit of purchasing exchange papers frequently at other printing offices, and seemed much surprised, when we told them that we could not honorably sell any papers sent us through the kindness of our editorial brethren, and that we could not, with any decency, fill our own pockets, by making such a treacherous use of the labors of others. We recommend the proposed convention of editors to pass a decree, whenever they meet, excommunicating any such delinquents from all interchange of courtesy and civility.—*Boston Courier*.

We learn that JOHN PRINCE, Esq. of Boston, has put into operation a set of Patent Mills for hulling and cleaning Rice, near the Free Bridge, South Boston. By the politeness of E. Hersy Derby, Esq. we have been shown a specimen of the rice hulled at these Mills. It is pronounced by judges to be of a good quality, and has the advantage of being fresher than that which is hulled at the place of culture. Mr. Prince has erected a steam-engine, of about eighteen horse power, and we are glad to see that machine, so powerful in the aid it affords to the labors of man, so generally and extensively introduced into the capital. The great number already erected, and the profitable use made of them, give assurance of a much more general introduction. A single steam-engine, even of a small power, oftentimes gives employment to some twenty or thirty operatives, each one maintaining himself, and often a whole family. With anthracite coal and steam-engines, a town or city might be built up, and kept in a prosperous condition.

Mr. Prince has published a hand-bill, stating the terms on which he disposes of his rice, accompanied with receipts for using rice flour, which is ground at his establishment.—*Salem Register*.

A severe frost in Louisiana and Mississippi has caused immense injury to the cotton crops, heretofore considered as promising abundantly. The damage, it is said, will exceed 20 per cent.

Tea Wheat. This species of wheat is, we believe, peculiar to New Brunswick. Some years ago, a person in that province, on opening a chest of tea, found in the corner a small quantity of wheat; how it got there no one can tell, whether in London on the chest being opened by the East India Company, or in China, is equally uncertain; but the seed was sown in New Brunswick; it grew and flourished better than any previously sown. The produce was preserved, sown again, and multiplied so rapidly, that it is at the present time the kind of seed wheat generally sown, and known by the distinction of "*Tea Wheat*."—*Montreal Vindicator*.

A man named William Morton, convicted of the murder of Abner Jarvis, was publicly executed near Greensborough, Alabama, on the 25th ult. Under the gallows the unfortunate culprit remarked, that he had no doubt, from the evidence that he had killed Jarvis; yet, he had no recollection of the fact, being at the time under the influence of *ardent spirit*.

The great Pyramid of Egypt cost the labor of one hundred thousand men for twenty years exclusive of those who prepared and collected the materials. The steam engines of England, worked by thirty-six thousand men, would raise the same quantity of materials to the same height in eighteen hours.

WANTS A SITUATION AS GARDENER,

—A STEADY active young man, who is perfectly acquainted with each department of his business, and who can produce satisfactory recommendations.—Any communications addressed to A. B. at this office shall be promptly attended to.

25,000 YARDS COTTON FRINGE.

JUST received from Philadelphia, and for sale by ELIAB STONE BREWER, No. 414 Washington street. oct 31

STEAM RICE MILL, AT SOUTH BOSTON.

THE subscriber having purchased the Patent Rice Machines of Messrs. Strong, Moody & Co. of Northampton, with the exclusive privilege of using them in Boston and a large vicinity, has put them in operation at South Boston, near the Free Bridge. It is well known that rice in its rough state, or with its outer hull-on, will keep many years, and that after been cleaned, it is subject (particularly in warm weather) to weevil, and other insects, and is usually put in bad casks—he therefore hopes, by having this article always in a fresh state, in casks of different sizes, to meet with a ready sale. The mode of cleaning being entirely different from any other now in use in any other country, the grain is kept quite whole and very clean. It will be put in good casks of usual size, for export; also in barrels and half barrels, and in bags of 100 lbs. each, (which may be returned); also, ground into fine Flour, in quarter barrels—it will be delivered in any part of the city, for a reasonable charge, and will not be sold in smaller quantities. Also, the fine Bran, or Flour, so called in the Southern States, being the inner coat of the grain, excellent food for horses, cows, hogs, sheep and poultry—and the outer Hull, a prime article for packing glass, crockery, bottles and fruit, and is believed will prove valuable in making Coarse Paper, will be sold at a low price in large quantities.

This Rice is particularly recommended for whaling ships and others going long voyages, as from being highly polished, and free from dust and flour, and being put into their tight iron-bound casks, it will be free from any insects, until exposed to air.

[An Order Box is placed in Mr. Roger's Foreign Letter Office in the area of the City Hall, and a sample of the Rice in several Insurance offices. State street. JOHN PRINCE.
South Boston, Nov. 16, 1833. tf

NEW AMERICAN ORCHARDIST,

JUST published and for sale by GEO. C. BARRETT, Nos. 51 & 52 North Market Street, THE NEW AMERICAN ORCHARDIST, or a treatise on the cultivation and management of Fruits, Grapes, Ornamental Shrubs, and Flowers, adapted to cultivation in the United States.

This is recommended to the public as a treatise well worthy a place in every farmer's library, containing an account of the most valuable varieties of fruit, and the remedies for the maladies to which fruit trees are subject from noxious insects and other causes. Also the varieties of Grapes with their modes of culture, &c. Price \$1.25. J.19.

FARMER'S OWN BOOK.

For sale at the New England Farmer office the Farmer's Own Book or Family Receipts. Being a compilation of the very best receipts on agriculture, gardening and cookery, with rules for keeping farmers' accounts, &c. Price 50 cents.

CLOVER SEED.

4000 lbs. Northern Clover Seed.—500 lbs. Southern ditto.
For sale at the New England Seed Store, 51 & 52 North Market street. a 14

NEW ENGLAND SEED STORE, AND HORTICULTURAL REPOSITORY.

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS, upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country: these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

[Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

N. E. Seed Store, connected with the N. E. Farmer Office, No. 51 & 52 North Market-st. GEORGE C. BARRETT.

BRIGHTON MARKET.—MONDAY, DEC. 9, 1833.

Reported for the Daily Advertiser and Patriot.

At Market this day, 1425 Beef Cattle, 175 Stores, 1270 Sheep, and 260 Swine.

PRICES. *Beef Cattle*.—Sales went off heavy at prices little less than they brought last week, particularly the thinner qualities; a few very choice were taken, without weighing, supposed to cost \$5 50. We quote prime at 5 a 5 25; good at 4 50 a 4 75.

Barrelling Cattle.—We are hardly able to give the price; but few were sold, the barrellers refused to pay \$4 for mess, and like proportion for thinner qualities.

Sheep.—In good demand; we noticed one lot quite small and ordinary taken at \$1 75; also lots at 2, 2 25, 2 33, 2 37 and 2 50. Wethers at 3, 3 25 and 3 33.

Swine.—One lot was taken at 4 1-2 for Sows, and 5 1-2 for Barrows; one lot of 20 selected Barrows at 5 1-2; one lot to close, quite ordinary, more than half Sows, at about 4c. At retail, for small ones, 6 for Sows, and 7 for Barrows; large ones and old, 5 a 5 1-2 for Sows, and 6 a 6 1-2 for Barrows.

MISCELLANY.

From Fessenden's New England Farmer's Almanac.

ILLS OF IDLENESS, AND PLAGUES WHICH PURSUE THE PUPILS OF PLEASURE.

BY T. G. FESSENDEN.

WHAT pains and penalties attend
The wight whose being's aim and end
Is wholly self enjoyment!
His easy chair becomes a rack,
And all Pandora's plagues attack
The wretch who wants employment.

To shun the exquisite distress
Which ever waits on idleness,
He flies to dissipation;
Drinks deep to keep his spirits up,
And in the inebriating cup
Drowns health and reputation.

And now in Fashion's vortex whirl'd,
A dandy of the genteel world,
He figures in the ton,
The wise man laughs, the simple stare
To see the consequential air
The silly rake puts on.

Now drives his curriole about
To club, assembly, ball and rout,
To waste his time and treasure;
Gives sensual appetite the reins,
And takes illimitable pains
To seem a man of pleasure.

The course of life such fools pursue
Would worry down the wand'ring Jew,—
Worse off than galley-slaves!
And ten to one, about the time
The man of virtue's in his prime,
Such sots are in their graves.

But if their days are lengthen'd out,
By dint of constitution stout,
In apathy and pain;
A ruby and carbuncled face
Displays the signals of disgrace
Like mark, erst set on Cain.

Now dire paralysis and gout
Parade their forces round about
The citadel of life;
In vain the Doctor tries his skill;
His obstinate opponents still
Are victors in the strife.

Disease, remorse, with joint attack.
Now put at once upon the rack
Their bodies and their souls;
The wretched victims suffer more
Than Montezuma did of yore
When stretch'd on burning coals.

RELIGION AND COURTESY.

WE have always ranked WILLIAM PENN among the best men of any age. He was a christian and a gentleman. He knew in what liberty of conscience consisted, and what materials formed the gentleman. A real christian is always a gentleman. Upon the subject of religion and courtesy, Penn says:—

"However different I am from other men, relative to religious matters, I know no religion that destroys courtesy, civility, and kindness. These rightly understood, are great indications of true men, if not good christians."

We have had occasion, sometimes, to wish that the spirit of Penn was more prevalent.

This great man on one of his trials, being treated

harsh and ungenerously, put some home questions to the Recorder, on the law, who became testy, said—"I tell you to be silent. If we should suffer you to ask questions till to-morrow, you would never be the wiser."

"That," replied Penn, in his quiet way, "is according as the answers are."

A WORKING MAN.

About two years since, an old inhabitant of Nantucket, now about seventy-five years of age, leased a piece of ground for the purpose of raising vegetables for market that, through the following winter his pecuniary wants might in some measure be mitigated; but more especially that he might be employed in *doing something*—for if he is a moment idle, all pleasure of living seems to vanish. After having turned up his two acres, he proceeded to the work of harrowing; then procuring a pair of traces, he attached them to his body, already bent forward with hard work and old age to such a degree, that the ropes from the point of the harrow ran about parallel therewith. While thus at work, a passer-by dictated by the feelings of humanity, offered him the use of his horse. The old man thanked him, but remarked that the toil was a matter of his own choice, as he had nothing else to do in the day time. So he harrowed his ground, planted it, took care of the produce, and at harvest time his wishes were fully realized in the form of a good crop.

This was not performed merely to attract attention. The whole course of his life has been a continued scene of labor; and when conversing on his situation he seems to fear nothing but his inability to "find work."—*Nantucket Inquirer.*

CLOVES.

The tree which produces this well known spice is a native of the East Indies, and in its general appearance resembles the laurel; the parts used are the unexpanded flowers, which acquire their dark brown color from the smoke in which they are dried, in order to preserve their aromatic qualities.

From Fessenden's N. E. Farmer's Almanac, for 1834.

HUSBANDMEN, MANUFACTURERS, AND TRADESMEN.

HE who expects to find the husbandman flourishing, while the manufacturers are out of employ; or the tradesmen on the other hand in prosperity, while the farmer is in distress, 'let him, as Fuller says, 'try whether one side of his face can smile while the other is perished.'

Man cannot be idle and enjoy life; and though he may sometimes complain of the bitterness of the bread which he eats with the sweat of his brow, he would unquestionably find it ten times more bitter, if it could be eaten in absolute idleness, and without any considerable exertion either of the body or mind.

In the morning think what thou hast to do; and at night ask thyself what thou hast done.

Hints to Emigrants. By falling trees that cover the tops and sides of mountains, (says M. Humboldt) men in every climate prepare at once two calamities for future generations—the want of fuel and the scarcity of water.

Matrimony. Experience has long pronounced those marriages the happiest, in which the con-

tracting parties are of a condition nearly equal; so that when the first ardors of love are abated by time, neither can assume a superiority, or think it a condescension to have acceded to the nuptial alliance.

Something for setting out. Dr. Franklin did well to establish prudent but indigent young men in trade, to be reimbursed when they became established; because when a pump is dry, water must be poured in at the top before any can come up from the bottom.

BLACK CURRANT WINE.

A few Bottles of this wine, so highly esteemed by all acquainted with its medicinal properties, just received by Geo. C. Barrett, 51 and 52, North Market street. aug28

NEW ENGLAND FARMER ALMANAC FOR 1834.

JUST published and for sale by Geo. C. Barrett, No. 52 North Market street. The New England Farmer's Almanac, for 1834, by T. G. Fessenden, editor of the N. E. Farmer.—Astronomical calculation by R. T. Paine, Esq. Dealers supplied on liberal terms. oct

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honey-suckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

¶ No paper will be sent to a distance without payment being made in advance.

PUBLISHED BY GEO. C. BARRETT, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. XII.

BOSTON, WEDNESDAY EVENING, DECEMBER 18, 1833.

NO. 23.

IMPROVED HORSE POWER AND CORN COB MACHINES.

This machine is constructed for propelling any kind of machinery—is of easy and simple construction—very durable in its operation—in no way liable to get out of order, and is capable of being extended to any power required. Machines of one and four horse power, calculated for any common purposes, are easily operated, and occupy but a very small space. Price \$50 to \$75.

With this power almost any kind of tools or machinery can be worked to very great advantage and saving of labor. (Threshing Machines, Hay Cutters, Corn Shellers, Winnowing Machines, Cider Mills, &c. can be attached to the same power, and worked separate or together, as may be required.)

ADDITIONAL DRUMS, or GEERING, fitted for any purposes.

IRON WORK FOR HORSE POWERS, furnished complete.

Machines of the above description may be seen and purchased at No. 52 North Market Street, Boston.

From the Virginia Herald.

MOLASSES FOR PRESERVING FRUITS.

As Economy is the order of the day, permit me through the medium of your paper to communicate to our ladies, a receipt for preparing molasses for preserving fruit, &c. which renders it much better suited for that purpose, than a syrup prepared from the best loaf sugar, as it is not so liable to candy, nor (if well prepared,) to ferment.

Take 8 lbs. molasses, bright New Orleans, or Sugar House.

8 lbs. pure water,

1 lb. coarsely powdered charcoal.

Boil for 20 minutes, then strain through fine flannel, double—put it again in the kettle with the white of an egg, and boil gently, till it forms a syrup of proper consistence, and strain again. I should not trouble you with the above, but I am satisfied that those who may make the experiment will be so well pleased with it, as to recommend it to their acquaintances generally. G.

DOMESTIC YEAST.

Persons who are in the habit of making domestic bread, cake, &c. can easily manufacture their own yeast by attending to the following di-

rections:—Boil one pound of good flour and a quarter of a pound of brown sugar, and a little salt, in two gallons of water for one hour. When milk warm, bottle it and cork it close, and it will be fit for use in twenty-four hours. One pint of the yeast will make 18 pounds of bread.

Repository of Arts.

FATTENING HOGS ON APPLES.

We purchased an excellent hog of Mr. Ebenezer Hunt of Cummington, a few days since, which weighed 380 pounds. He sold another that weighed 343 pounds. He informed us that they were common, lean hogs last summer, and that they were fattened almost wholly on sweet apples. They consumed not over two bushels of corn and twelve bushels of potatoes each; all the rest of their food was apples; most of the apples were boiled.—*Hampshire Gaz.*

From the New York Farmer.

BURYING BEES.

We make the following extract of a letter from a lady to the Editor. Our correspondents will see the propriety of furnishing us with information that will bear the ordeal of experiment:

"The other day I made a visit to Eliza, and found her digging in the garden a grave for a couple of bee-hives. The honey had been taken from them too late for them to make sufficient for the winter. She had seen an article in the New-York Farmer, stating that bees could be kept under ground with little or no honey. She was, therefore, induced to try the experiment; and if it does not succeed, she thinks she will prosecute you for damages."

TO DESTROY INSECTS.

A writer in the Horticultural Register, gives the following receipt, which he says, he has tried for many years with complete success.

To destroy insects on trees.

2 oz. nux vomica,

2 oz. soft soap,

1 lb. tobacco,

$\frac{1}{2}$ pt. spirits of turpentine,

8 gallons of water.

Boil them, all together, down to six gallons and use it milk warm; the trees are to be carefully dressed with it, by dabbing in on with a sponge.

RAT-IFICATION.

A LADY, who was a notable housekeeper here, many years since, found the eggs, in her well stored larder, diminishing almost daily. She did not like to suspect her domestics of nullification, but still the eggs went—and went. She secreted herself in a room and watched. A company of rats came. A large full furred rat, the principal thief, grasped an egg with all four of his legs, and rolled over on his back.

Two others his accomplices, laid hold of his tail with their teeth, and tugged their load manfully to a sly rat hole hard by, where it is fair to infer that all hands feasted on the "spoils of victory."—*Port's Journal.*

ELEPHANTS FOR PLOUGHING.

ELEPHANTS are now used in Ceylon for ploughing the rice fields, and in preparing new ground for the cultivation of coffee, pepper, &c. An elephant will perform the work in one day which twenty bullocks were in the habit of performing before. In a country like Ceylon, which is very thinly inhabited, by this system of employing Elephants, much time is saved, and a great deal of agricultural work performed. An Elephant may be purchased in Ceylon at any time for 10 or £15.

From Goodsell's Genesee Farmer.

NUTRITIVE MATTER.

THE following is taken from Sir H. Davy's Table of Nutritive Matter afforded by different vegetables, and may be found useful to farmers, in making calculations as to the worth of different crops, for feeding stock, &c. Indian corn, not being the produce of the Island of Great Britain, was not analyzed by him, but we give the results from other chemists:

1000 parts each gave the following:—

| | | | | |
|---------------|-----|--------------|---|-----|
| Winter Wheat, | 955 | Rye, | - | 792 |
| Spring Wheat, | 940 | Barley meal, | - | 920 |
| Indian Corn, | 800 | Oat meal, | - | 670 |
| Potatoes, | - | Turnips, | - | 42 |

Now if we make a Table from the above calculations, giving to each the produce of an acre (as near as may be) we shall see at once the relative value of each compared with the other, as contributing to the support of animal life:

| | | Nutritive Matter. |
|--------------|------------------------|-------------------|
| Potatoes, | 15,500 lbs. would give | 3,125 lbs. |
| Indian corn, | 2,400 " | 1,920 |
| W. Wheat, | 1,200 " | 1,146 |
| Rye, | 900 " | 722 |
| Barley, | 1,200 " | 943 |
| Oats, | 960 " | 552 |
| Turnips, | 7,500 " | 315 |

Thus it appears, that one acre of Potatoes is equal to about two acres of Indian Corn, three of Wheat, four of Rye, or Barley, six of Oats, or ten of Turnips. Should the above table be found incorrect, we will thank any of our farming friends to forward a more accurate one, and we will give it a place in our columns.

GOOD HOUSE-KEEPERS.

If there be any thing among the temporals to make life pleasant, it is in the walls of a well ordered house, where all is adjusted to please—not by its finery or costliness, but by its fitness, its air of neatness and content, which invite all who enter to taste its comforts. The woman who does not make this a grand item in all her routine of duties, has not yet learned the true dignity of her station—has not yet acquired the alpha of that long alphabet which is set before her; and she who despises this noble attainment despises her best worldly good, and indirectly despises her family, her neighbors, and the word of God. "She looketh well to the ways of her household," was spoken by the wisest man, that ever lived, and will be told a memorial of all those who have been eminent for this noble character.—*Gen. of Tem.*

From the Genesee Farmer.
VEGETABLE PHYSIOLOGY.

To check the growth of Fruit Trees and promote their fruitfulness.

In page 42 of this volume, is an inquiry by the editor, of "What will check the too free growth of fruit trees, so as to produce fruit buds, flowers and fruit? and if separating a part of the roots from the stock would produce the effect?"

These are important inquiries, and I will try to answer them, my own experience having fully illustrated the example stated, and its remedy.

In order to a full understanding of the subject, we must inquire:

1. Into the cause producing the effect, viz.: the too rapid growth of the wood, and its consequent unfruitfulness; and

2. The legitimate and physiological treatment necessary to obtain the desired result.

Trees, and in fact all vegetables, have, like animals, three distinct periods of existence, viz.: youth, maturity and decay. Youth may be termed that period in which the tree is growing to a bearing state, the time consumed for which depends much on its treatment and kind. Maturity is the term in which it yields its fruit; and decay, finally, but almost imperceptibly, follows sooner or later, and at last puts an end to its existence.

These three states, or periods, may be measurably retarded, or accelerated, by artificial causes. The young sapling, healthy and fresh from the nursery, planted into a kindly soil, and cultivated with attention, throws out and expands its vigorous shoots for many years. It finally, although it may seem a protracted time, arrives at its bearing age, and yields its annual supply of fruit, bountiful in proportion to its stature, and through a succession of years proportioned to its former term of youthfulness; and even age, as come it finally must, seems hardly willing to arrest its bounty, and lingers with tardy pace ere its withering hand is laid upon it. This I conceive to be the most natural and profitable course of all fruit bearing trees. I know that many people are in great haste to have their fruit trees yield their long expected reward, and in constant expectation of receiving it, have cultivated and treated them with much care. They are, to be sure, highly gratified in their exuberant growth, and if in a few years they do not yield a corresponding supply of fruit, are often apt to complain.

Now, on the true principles of vegetable physiology, the complainants are erring, and the tree right. They, for the purpose of getting fruit soon, stuff the tree with vegetable nutriment almost to repletion. The tree, in its turn, understanding well its own proper functions, thrives apace, intending at a proper time, to pay principal and interest for the kindness thus heaped upon it, and which it assuredly will do if suffered. But the owner is impatient for his fruit, and prunes and nurses the tree, wondering why it does not yield him fruit, and perhaps even threatens to destroy it for its perverseness. The simple fact is, the tree is not ready. It has not arrived at maturity, and is prevented from yielding fruit from the very nourishment and fullness continually received from the hand of its cultivator.

This I assume to be the natural state of the tree. But the object, as I infer from the questions at the head of this article, is, to obtain the fruit before the tree arrives at maturity, or, more technically, to force it.

The question now recurs, will you remedy it by cutting off a part of the roots?

By no means. The tree has no more roots than are necessary for its support, and would be much injured by parting with a share of them. Besides, I am unable to account, on physiological principles, how the cutting off a part of its roots will throw fruit buds into the top of the tree. The production of flowers and fruit require as liberal supplies of sap as that of wood, and if the source of supply be cut off, viz. the root, from whence is the supply to come?

But I proceed to consider the second inquiry, to wit: "to check the exuberant growth of wood, and cause it to produce fruit buds, flowers and fruit."

I shall assume that the trees are of well known kinds, and whose bearing qualities have been tested, and that they are situated in an open and well cultivated ground, as I believe the whole complaint can be made under no other circumstances. The trees have also been well pruned, and are accommodated with a good shaped head for bearing, and of fair size. My answer is: *Lay your ground, on which your trees stand, well down to grass, and let it remain so for several years.* The next year after seeding the ground, the growth of young wood will be much diminished, and fruit buds will form in moderate quantities: flowers and fruit will follow the next season. That year, if the tree be an annual bearer, an increased number of fruit buds will be found, and so continue in annual succession. If, after a few years, the tree is too stationary in its growth, for it certainly will not throw out young wood very rapidly, plough, and cultivate, and manure the land, and you can supply the trees with any amount of young wood required, although the bearing will still continue in an abated degree. If you find your trees get too thrifty, you have only to seed down again, and manage as circumstances may require.

That this method has been tried with success I know, for I did it myself some years ago, and am indebted partly to accident for the discovery. About the year 1817, my father had an orchard which, when planted, nearly surrounded his garden, and which was used mostly for mowing ground. The trees were young, perhaps fifteen years old, and had grown tolerably well. A few years before the time I speak of, the garden had been enlarged on two sides, which took, on each side a row of apple trees within the fence. The land being well cultivated, the trees grew astonishingly; and not being pruned, acquired immense heads, and bore little or no fruit, while those in the meadow, although of much less size, bore abundantly. I was then a boy of eighteen years old, and the trees were delivered over to my care, "to prune into good order." I had read "Forsyth on Fruit Trees," and supposed I knew all about it; so at it I went, with the axe and saw, and took out full one third of their tops, supposing that they would now go to bearing at once. But not so. They grew as before, and bore a little better than they had done. I confess I knew not what to do, although, if I had let them alone, they would have borne, when "their time come," all the better for it; yet I was impatient for their fruit. At length the plan suggested itself to seed down the ground where they stood to grass. It was done, and in a short time their growth was nearly stopped, and they bore abundantly of the finest apples.

They are now, for I saw them two years since, much the finest of all the trees in the orchard, from the benefit of having a rapid growth in their youth; and the others, from growing less rapidly when young, and bearing so much sooner, have a much older appearance, and were the ground on which they stand not occasionally ploughed and cultivated, would soon bear evident marks of decay.

This matter now must be accounted for on rational principles, and it may truly be hard to compel a person to say what makes the tree bear wood one year and fruit the next, when the whole process is hidden in the earth, and a profound secret of nature. I will, however, state my own opinion, and others may judge of its correctness.

While trees are young, their roots expand and run near the surface of the earth. If the ground be cultivated, the earth is warm and light, and the roots absorb much nourishment, and a rapid growth of young wood is the sole consequence. In process of time, as the tree increases in size, the roots find their way deep into the earth, where the temperature is lower, and its growth is by degrees checked; fruit buds are not consequently formed, and the tree comes into the bearing state. Now putting land into grass has the same effect. The sun is hidden from the earth. The temperature is lower—the richer nutritious gases of the soil are absorbed by the grass, and the same result is produced as if maturer age had forced the roots more deeply in the ground.

ULMUS.

From Goodsell's Farmer.
MANAGEMENT OF COLTS.

Sir,—HAVING noticed among the selections in your useful paper, an article from the New England Farmer, signed James Walker, describing his, and an excellent manner of breaking Steers and Colts, induces me to lay before you a different course of management with colts, which I have adopted for several years with perfect success.

I have experienced some difficulty with old horses being refractory, and baulky, in the harness, having formed a habit of becoming sulky, on the least emergency, and refusing to go at all, and have frequently witnessed the delays and troubles attendant on such habits, and the excessive beatings which the poor brutes are often subject to for want of being properly managed at the beginning.

I therefore, to avoid all such troubles, commence with the colt about one week old. I halter him, and tie the halter around his dam's neck, and lead her for some minutes. After some feeble resistance the colt submits, being easily induced to lead by the side of the mother. I pursue this for some weeks, once a week, allowing a boy to ride the mare. In the mean time, I hitch the colt to a firm post, which it will pull at, but to no effect; then handle him from head to foot, frequently coming up to him until he is satisfied that there is no unfriendly intention. When the colt is about three months old, and has acquired a good appetite, choosing a warm day, I hitch the mare and colt, at a little distance from each other, and after about two hours' abstinence, I draw the milk from the dam, and present it to the colt, which he soon learns to drink. By repeating this a few times, he drinks readily, when the milk from cows, may be substituted for that of his dam. When weaned this practice will be found beneficial as the loss of flesh may be prevented, and the

colt kept in a growing condition. Colts thus practised will not refuse sour milk although it has become thick.

The benefit of this practice was fully demonstrated with a colt of mine, which at two years old, from unskilful castration, was reduced so low, that he was not able to rise alone, or receive any kind of food except milk, and not more than one pint of that at a time, as even that quantity in some instances produced almost fatal paroxysms which lasted several minutes. In this instance a few gallons of milk saved his life, and he is now a valuable horse.

At two years old I hit my colts thoroughly, but never allow them to be treated harshly. Occasionally before they are three years old, I put a harness on them, and lead them. I next put on a blind bridle, traces and whippetree, with a rope or chain attached to it, held by a man who pulls it gently as the colt inclines to draw, being careful to not stop him. I next put a well broken horse by his side, harness them together, and attach a double whippetree, with as many men to hold it as is necessary to require all the colt's exertions to draw them, letting the traces from the beginning play freely against his legs so that he shall become familiar with them. I next attach the reins and take a whip, continuing yet to lead him, occasionally snapping the whip, with corresponding actions calculated to hasten his speed. The colt soon learns the use of the whip and what is meant to be communicated by it, and hastens his speed accordingly. I next hitch the span to a lumber wagon, tying that end of the whippetree to which the old horse is hitched back, so as to keep it square, to prevent him from throwing the colt back, by his superior strength. In this manner I drive them for some time, occasionally stopping where there is a gentle ascent in the road, so that the wagon will move backward, and with gentle pulling upon the reins learn the colt to travel backwards, and by repeating it often in various places, he soon learns to comply in this respect with the wishes of the driver without contracting any refractory habits. I continue using him in this kind manner, being careful never to overload him, until his age and experience will justify putting him to heavy loads.

The best method with which I am acquainted, for breaking colts to the saddle, and on which I have practised with perfect success, is to take them from home in company with a horse, with which they are acquainted, there to get on and off from them, several times, until they submit to being mounted without resistance, then let the riders mount both the old horse and colt, the rider of the former leading the colt by the side of the horse. The colt will be disposed to keep company with the horse, and will soon learn that you wish him to go forward. Let the speed of the horse be increased a little, occasionally, and the colt will soon learn to increase his also, as he will be unwilling to be left alone, and will be inclined to follow the horse home.

I have in this manner succeeded extremely well with a colt of three years old, which at first could not be rode past bars, gates, or barns where he was acquainted.

By injudicious treatment, and requiring colts to perform that they have never learned, the lives of riders are often in jeopardy; and by maltreatment, they contract bad habits, which it is much easier to

avoid than to correct after they have contracted them. I am Sir, yours respectfully,

ALLEN T. LACY.

South Chili, Nov. 25, 1833.

["A merciful man is merciful to his beast." Mr. Lacy's method seems perfectly in accordance with the laws of humanity. How often do we see the most brutal punishments inflicted on these noble animals for not performing that which they have never been taught; such practices are as far from reason as it would be to punish a child for not spelling words who had never been taught the alphabet.—ED. GEN. F.]

From the Boston Courier.

FESSENDEN'S PATENT STEAM AND HOT-WATER STOVES.

WE have had in use, at our office, for several weeks, a Stove invented and patented by T. G. Fessenden, Esq. Editor of the New England Farmer, which we find to be very efficient and economical in warming an apartment. It affords an agreeable and wholesome warmth, without the dry and burnt air which often renders rooms, heated by common iron stoves disagreeable and unhealthy.

The stove consists of two concentric iron cylindrical vessels, which stand perpendicularly. The lower cylinder is placed on a square cast iron box, which serves for an ash pit. Within this cylinder is a grate and fire pot, as in common stoves. The upper cylinder, or boiler is placed directly over the fire by letting its lower part into the top part of the lower cylinder, where it is supported by a projection of its sides, resting on, and closing the upper end of the lower cylinder. To the upper part of the upper cylinder is attached an iron vase or urn, into which the water ascends in boiling, and is thus prevented from overflowing. This vase is closed by an iron lid, removable at pleasure.

The interior cylinder, or boiler, and its contents serve to arrest, retain and eventually give out into the room much heat, which would otherwise escape through the smoke pipe into the chimney or open air. The interior cylinder likewise forces the current of heat to pass near the sides instead of the centre of the stove, by which means more caloric is transmitted through the sides into the room than would be if its course were not impeded. There is, likewise, an advantage, in many cases, in having hot water at hand, which may be drawn out of the stove for use when wanted; and the water in the stove will give out heat, gradually, into the room a considerable time after the fire is extinguished.

We have never seen a stove of any other description that would give out so much heat with so small a quantity of fuel.

Stoves of the above description are manufactured at West Boston Iron Foundry, No. 36 Bridge street.

STAVES.

OUR attention was yesterday directed to some Staves (a sample of which has been left with us,) manufactured at the *Micmac Mill*, at Bear River, Nova Scotia, owned by Messrs. Tucker, Turnbull & Co. The Machinery we are informed, is altogether the invention of Mr. Francis Hoard, and for ingenuity and despatch is equalled by none heretofore in operation; by it *seven* Staves are com-

pletely dressed from the log, jointed and prepared for hooping, in *one minute!* Although we are not particularly acquainted with the manufacture of such articles, we presume the advantage thus obtained over the old method of dressing Staves by hand, may be rated among the most useful and important inventions of this enlightened age.—*St. Johns Courier.*

CHESNUT ORCHARDS.

THE price of chesnuts in our markets has led us to think that many farmers might, with profit, devote a portion of their less productive lands to the cultivation of the chesnut. They have commanded, this season, from \$6 to \$2 50 per bushel. At this rate an orchard would be profitable, independent of the timber. The tree is of quick growth, and produces abundance of shoots or sprouts from the stump.—*N. Y. Farmer.*

MASS. HORTICULTURAL SOCIETY.

The Standing Committee on Ornamental Trees, Shrubs, Flowers, &c. award the following premiums for the year 1833, viz.

For the most successful cultivator of the *Magnolia glauca*, to Robert L. Emmons, a premium of 10 dollars.

For the five best varieties of Chinese Chrysanthemums, a premium of 3 dollars to Charles Hovey, of Cambridgeport.

For the best half dozen of Tulips, a premium of 5 dollars to Mr. T. Walker, of Roxbury.

For the best *Ranunculus*, a premium of 5 dollars to Charles Hovey of Cambridgeport.

For the best Anemonies, a premium of 5 dollars to Thomas Mason, of Charlestown.

For the best specimens of Pink, a premium of 3 dollars to Mr. T. Walker, of Roxbury.

For the best specimens of prize Carnations, a premium of 5 dollars to Mr. Thomas Mason, of Charlestown.

For the best specimens of Foreign Flowers, of hardy kinds, to Messrs. F. & J. Winship, a premium of 5 dollars.

For the finest collection of Roses, a premium of 10 dollars to Messrs F. & J. Winship.

For the finest Dahlias, a premium of 5 dollars to Mr. E. Putnam of Salem.

For the best show of Pæonies, a premium of 5 dollars to Mr. William Kenrick, of Newton.

For the best specimens of hardy flowering shrubs, a premium of 5 dollars to Mr. Wm. Kenrick, of Newton.

By order of the Committee;

JONA. WINSHIP, Chairman.

Dec. 14, 1833.

EXHIBITION OF FRUIT AT THE MASS. HORT. SOC. ROOMS.

Horticultural Hall, December 14, 1833.

Apples. Spice Apples from Messrs. Willot & Wilson, Boston, a peculiar specimen partaking of the Russeting, being distinctly marked.

Pears. From Mr. Wm. E. Payne, Waltham, two varieties, names unknown.

From William Oliver, Esq. Dorchester, a fine specimen of Princes' Brown, or Sweet St. Germain Pear—a valuable variety, half melting, sugary and fine flavored, ripens from Dec. to Feb. it never crooks and is a great bearer—also the Ambrette, not at maturity.

For the Committee on Fruits,

B. V. FRENCH.

From the New York Farmer.

PREPARING FOOD FOR HORSES.

ON the authority of Mr. Dick, it is stated that eight ounces of saliva are discharged in a minute from the salivary glands of the horse, when he is eating his food. In masticating hay, dry and hard as it generally is, these glands are kept discharging too long, often through the greater part of the night, to satisfy the appetite of the horse. It seems reasonable that this would exhaust his strength. Hence the propriety of lessening the labor of eating, by cutting or softening the hay, for an animal that so nobly and spiritedly toils for his master. The effect of feeding horses on dry hay is to wear away the teeth, and, consequently, the labor is increased as the animal advances in age.

The use of potatoes for horses would be much more general if they could be more easily preserved through the winter and summer. The writer recommends to bury them five feet below the surface of the ground, where they will keep until August. Bean straw is said to be as nourishing to horses as hay. If so, it should be an object with the American farmer to cure it properly.

From the New York Farmer.

IMPROVED LIVE STOCK.

THE Hon. Henry Clay, while on his recent visit to Albany, offered for a bull and a heifer calf, six months old, belonging to Gen. S. Van Rensselaer, jr. four hundred dollars, which were refused.

They were from the famous stock of short horn Durham cattle, imported by Gen. S. Van Rensselaer in 1823, from the herd of Mr. Champion, England.

We are also informed that Mr. Bement, of Albany, is about importing some of the late improved breed of Durham cattle, as well as some of the much esteemed Southdown sheep.

Mr. Hawes, an English gentleman, lately settled near Albany, brought out with him last fall some of the Berkshire breed of hogs, which were very much admired at the fair, and the demand for the pigs was so great that he could not supply one half the demand.

We have two most beautiful pigs, or rather hogs, of this breed, three months old, obtained from Mr. Brientnall, of Goshen, N. Y. We have not had the pleasure of seeing Mr. Hawes' pigs, but if they are superior to ours, there is no wonder that the demand exceeds the supply.

ORCHARD GRASS.

THE graziers of the valley pronounce it more nutritious than either Timothy, Clover, or Herds Grass, and it is by uniting this grass with the two first that the proverbially fine pastures and meadows of the central counties of Pennsylvania are formed. It resists the heat of our summers, and recovers from the effects of the hoof and the tooth very rapidly. For seed lots two bushels should be sowed to the acre; and for the scythe, or for pasture, the mixture should be one bushel of orchard grass and one gallon of timothy seed, over which a gallon of clover should be scattered in March.—*Kanawha Banner.*

TOP DRESSING PERMANENT PASTURES.

ON New-York Island, and in the vicinity, milkmen pay a very high price for pasture. In the spring or early summer months, as soon as the grass is of pretty good height, they turn in a large

number of cows, and in a few weeks the grass is eaten down. When it is pastured off the second time, in particular, it would seem as though one half of the surface was ungrazed—occupied with the cow droppings. When the Editor was a little boy, he and his brothers were provided with dung beetles, and every spring, in fine April mornings, before school hours, it was sport to go over the pasture and mowing grounds, and knock into pieces the cow and horse droppings. Similar practices should be adopted by every farmer, particularly by those who hire pasture. The following extract is worthy of consideration:

Old women have been engaged to collect in baskets, latterly in wheel-barrows, the droppings of cattle in pasture-land, and to deposit the collections in heaps, at convenient stations in the fields, where the manure has been compounded with the earth previously laid down and prepared. When duly mixed, the compound has been laid down as a top dressing on the same field. The result has been a great increase of fertility, while the whole fields have presented the equable and beautiful appearance of a lawn.

At these stations earth has been previously prepared and laid down, from the scourings of ditches, parings of head-furrows, the furrows ploughed out (acting besides as useful drainage, where the land is damp, and in ridges,) or other sources.

The quantity of earth used ought to depend on its quality. Four cubic yards to the cubic yard of the collection has been found to produce rich and powerful top-dressing. In many situations five may be used with safety; in others three will be more expedient. If each cubic yard be allowed to cost 2d. then, on the average of four to one, the cost will be 8d. for the earth and 11d. for the manure; and the proceeds being five cubic yards, the cost is under 4d. per yard for a rich compound laid down in the field in which it is to be used.

The plan followed has been to commence at one side of the field, and to dress at the rate of 15 to 18 cubic yards per acre, as far as the compound will go, to commence next year, where the former year's process stopped, and so on; and in ordinary pastures, the calculation in 1831 was that a field would be gone over every second or third year.—*New York Farmer.*

MANAGEMENT OF SANDY LAND.

THE celebrated Duckett of Petersham, in Surrey, England, practised on the following rules:—1. Ploughing very deep; 2. Ploughing seldom, but effectually, often putting in seven crops to four ploughings; 3. Occasionally raising a crop of turnips the same season, after wheat or pulse. There are instances, however, of cultivating sandy soil with success by ploughing only to the depth of two or three inches, gradually increasing it as the soil becomes more enriched. Small stones should not be picked from a sandy soil, as they tend to prevent evaporation. The fertility of this soil depends, in a very great degree, on the quantity and regular succession of rain. In a valley where moisture accumulates, it is very productive. In the rainy climate of Turin, the most prolific soil has 77 to 80 per cent. of siliceous earth, and from 9 to 14 of calcareous; but in the neighborhood of Paris, where there is much less rain, the siliceous sand is only 26 to 50 per cent. in the most fertile soils.

CATTLE, HAY AND GRAIN.

THE feeders have paid, we believe, for good cattle for the stall not far from 5 dollars per 100 pounds. Corn is worth 80 or 85 cents per bushel, and hay 12 dollars or more per ton. Those who are feeding cattle must obtain high prices during the winter and spring, or lose money. 20 or 30 head of fat oxen were sold in Hatfield last week for the Providence market, at about 6 dollars per hundred.

About 1600 bushels of New-York corn and a large quantity of Southern corn have been received in this village. We are informed that hay brings 16 dollars per ton at the Chickopee Factory Village.—*Hampshire Gaz.*

From the Poughkeepsie Journal.

PROFITS OF FARMING.

THE business of farming is often considered less profitable than other business; and the reason is, that the income of the farm is not truly estimated. If the entire revenue of a well regulated farm were estimated, we should find the per cent. on the property not less than that of any property, that is equally safe.

My neighbor B. came to me the other day quite discouraged on account of the small profits of farming compared with other business. Now, as I knew my neighbor to be a good farmer, and a pretty correct calculator, I attempted to convince him, from his own statements, that he is enjoying a very fair per cent. from his farm. He has a small well-improved farm, which, two years ago, was bought for \$7,500; since which he has built a house that cost \$1000, which, with his entire stock, &c. makes his property worth \$10,000. From this my neighbor complained, that he realizes only a few hundred dollars, not more than — per cent.

But there are many things not counted which ought to be reckoned as part of his income. His house, as I said, though not necessary to the business of farming, besides the one he already had, yet agreeing well with the circumstances of his family, may be considered as yielding at least \$60. Besides the team, wagons, &c. necessary for his farm, he keeps a good pair of horses and pleasure-wagon, because, you know, his wife and daughters must ride in a style that is agreeable to their circumstances and standing in society. The value of these, counting it equal to the expense, is not less than \$140 per annum. And of wood, my neighbor tells me he burns more than 30 cords, which at \$3 per cord is \$90. Then, his garden, orchard, and fruit yard, for all these are managed in the best manner, yield him the value of \$80, including his cider, &c. In addition to these we might mention the veal, the poultry, and the eggs, and the fine piece of mutton that he has now and then; for, as the Irish lord says, "he lives on his own estate and kills his own mutton." All these, though not generally estimated, are a part of the income of his farm. So here is more than \$370, in addition to the four hundred which he acknowledges to have received in cash as the clear income of his farm. It is true that this is for the comforts, &c. of my neighbor's family, but such as they require, and such as, in any other business, would cost the cash. My neighbor was satisfied. And I am persuaded that a careful examination of facts would lead to conclusions very favorable to agriculture. And your readers would welcome a statement of these conclusions in your paper.

ARITHMETIC.

GREAT YIELD.

MR. NOAH CLARKE, jr. of this town gathered on the 26th of October, from one tree on his farm *one hundred and nineteen bushels of sound apples*—the produce of one tree, there being no other within fifty rods of it. It was ascertained that they would produce more than fifteen barrels of cider. This is certainly a great yield, as it is understood they were all (and none but sound ones) gathered at one time, leaving under the tree all those which had fallen during the fore part of autumn, and had become materially decayed.—*Westfield Journal*.

CULTURE OF POTATOES.

A FREQUENT change of seed is necessary. Any sort may be continued fertile and profitable by removing them from one county to another every fourth or fifth year, or by raising them alternately on very different descriptions of soil. In the cultivation of this useful plant, it appears from many experiments that it requires ample space. In field culture, placing the sets of the strong growing kinds in every third furrow, and those of the dwafers sorts in every second, are eligible distances. There are different opinions held respecting the necessity of earthing up potatoes. On very thin soils, however, it is absolutely necessary. On deeply ploughed, or trenched ground, earthing up the stems is certainly less necessary, because as the under-ground runners, which produce the tubers, are inclined to extend themselves as deeply in the soil as the roots, they do not seem to require any additional depth of earth immediately over them. But this depends entirely upon the open porousness of the soil, and the manner of growth of some of the kinds. Plucking off the flowers increases the size and number of tubers. It is founded on a law of nature, disposing a plant constituted to produce at the same time both seeds and tubers, to yield either one or the other more abundantly, according as either is destroyed. If tubers be not allowed to form, many flowers and apples will be the consequence; and if the flowers be destroyed as soon as they appear, the tubers will be increased. It is bad management to plant the refuse, or odds and ends of last year's crop, for the sets of this. If potatoes are planted at all, they should be planted well.—*Br. Far. Mag.*

From the Greenfield (Franklin) Mercury.
ESSENCE PEDDLING.

THERE is not a town in the east, nor a prairie in the west of the United States, where the essences and the essence-peddars of Yankee-land have not been seen and heard of: nor do we believe that there is any business which has been so much celebrated and whose origin is yet so little known. It commenced about twenty years ago in Ashfield, in this county. The first pound of oil of peppermint ever made in this region, and we believe in this part of the country, was made there. The article had previously been imported from abroad, and sold at sixteen dollars per pound. The price was soon reduced to twelve. It went down gradually to eight, and remained stationary for some years, when it was reduced below a remunerating price by speculators who overstocked the market. Two or three years ago it was as low as seventy-five cents. It then took a start and rose in eight months to five dollars, but is now reduced again to about three, which is understood to furnish a very handsome profit.

Great part of the surface of Ashfield, was for-

merly devoted to the cultivation of "mints;" almost every house had its still, and a great many pretty properties were made there, while the place enjoyed a monopoly of the business. Latterly, however, it was discovered that the herbs could be raised at much less expense, and without the labor of hoeing, on the virgin soil of Ohio and the western part of New York. Vast supplies are now derived by the Ashfield merchants from Phelps, a town in the last mentioned state. It has been estimated that as many as seventy of the young men of Ashfield make peddling their regular occupation, besides many others not inhabitants of the town, who are supplied with goods from thence. Flocks of twenty or thirty have sometimes taken their departure from the place in a single day to the east, west, north and south, bearing

Goods from all nations lumbering at their back,

making money and driving bargains with invincible perseverance under the very noses of the stationary traders, and in spite of all the ingenuity of legislation which in all the states has strained every nerve to break them down. We could mention names of those who began with peddling essences, who are now thriving and wealthy merchants in the Atlantic cities; men who after penetrating all the mysteries attending the manufacture of peppermint, spearmint, golden-rod, winter-green, worm-wood, &c. now control the movements of commercial fleets, and decide the daily fate of stocks. The number is of course infinitely greater of those who have made this business an apprenticeship to regular country trading, and an avenue to moderate wealth.

GIANT TREES.

Among the oldest and largest trees in France, is an oak in the burial-ground of Allonville, which measures, above the roots, upwards of thirty-five feet round, and at the height of a man, twenty-six feet. A little higher up, it extends to a greater size, and at eight feet from the ground, enormous branches spring from the sides, and spread outwards, so that they cover a vast space with their shade. The height of the tree does not answer to its girth: the trunk from the roots to the summit, forms a complete cone; and the inside of this is hollow throughout the whole of its height. Several openings the largest of which is below, afford access to this cavity. All the central parts having been long destroyed, it is only by the outer layers of the alburnum, and by the bark, that this venerable tree is supported; yet it is still full of vigor, adorned with abundance of leaves, and laden with acorns. The lower part of the hollow trunk has been transformed into a chapel, of six or seven feet in diameter, carefully wainscoted and paved, and guarded by an open iron gate. Above and close to the chapel is a small chamber containing a bed; and, leading to it, there is a staircase, which twists round the body of the tree. At certain seasons of the year, service is performed in this chapel. The summit has been broken off many years, but there is a surface at the top of the trunk, of the diameter of a very large tree, and from it rises a pointed roof, covered with slates, in the form of a steeple, which is surmounted with an iron cross. Williams, in his "Vegetable World," from which we derive these facts, observes that over the entrance to the chapel there is still visible an inscription which states that it was erected by the Abbe du Detroit, curate of Allonville, in the year 1696.

Even this memorable tree is not without its peer. We have heard of nothing like it in America; but at Oakley, in Bedfordshire, the seat of the Marquis of Tavistock, there is an oak, now in perfect health, which contains about five hundred and twenty-seven cubic feet of timber, and the branches overspread a space of five thousand eight hundred and fifty superficial feet of ground.

The Chestnut tree grows still larger. In Gloucestershire, there is one measuring *fifty-two* feet round, and still continuing to bear fruit, which is known to have stood there in the year 1150. It has been called for ages "the Great Chestnut of Totworth." Brydone and other travellers in Sicily say that the "famous chestnut tree of a hundred horse" measures the enormous circumference of 177 feet; and that some travellers have dug about it, to see if it were a cluster of several trees, or only one; and they have found that, although divided, at or near the surface, into five branches, they are all united in one root.—*Mer. Jour.*

SPLITTING ROCKS.

In the granite quarries near Seringapatam, the most enormous blocks are separated from the solid rock by the following neat and simple process.—The workman having found a portion of the rock sufficiently extensive, and situated near the edge of the part already quarried, lays bare the upper surface, and marks on it a line in the direction of the intended separation, along which a groove is cut with a chisel, about a couple of inches in depth. Above this groove a line of fire is kindled, and this is maintained till the rock below is thoroughly heated, immediately on which a line of men and women, each provided with a pot of cold water, suddenly sweep off the ashes, and pour the water in the heated groove, when the rock at once splits with a clean fracture. Square blocks, of six feet in the side and upwards of 80 feet in length, are sometimes detached by this method. Hardly less simple and efficacious is the process used in some parts of France, where millstones are made.—When a mass sufficiently large is found, it is cut into a round form, several feet high, and the question then arises, how to divide this into pieces of a proper size for millstones. For this purpose grooves are chiselled out, at distances corresponding to the thickness intended to be given to the millstones, into which grooves wedges of dried wood are driven. These wedges are then wetted, or exposed to the dew, and next morning the block of stone is found separated into pieces of a proper size for millstones, merely by the expansion of the wood, consequent on its absorption of moisture; an irresistible natural power thus finishing, almost without any trouble, and at no expense, an operation which, from the peculiar hardness of the texture of the stone, would otherwise be impracticable but by the most powerful machinery, or the most persevering labor.

TO PREVENT FROST THROWING OUT PLANTS.

It is the effect of frost to unite more firmly the finer parts of the soil, and to disengage and throw out large substances, such as posts, stones, and plants not well rooted. To prevent young and newly transplanted plants from being thus injured, press down the ground round them. Strawberry beds and fields of grain should be rolled. It should be done early, rather than late in winter.—*N. Y. Farmer.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 18, 1833.

TO SUBSCRIBERS FOR THE NEW ENGLAND FARMER.

WE must rely on the candor of our esteemed friends and patrons to excuse our decision as regards the subscriptions due to us. We have sometimes been censured for not forwarding our bills yearly, and thus suffering considerable sums to accumulate imperceptibly. We have also been blamed for urging our demands with too much pertinacity.

THEREFORE, we this week, send our bills, with their dates and amounts, and very respectfully request those to whom they are directed to assist us as much as possible. Those who live at a distance are particularly requested to remit our dues by mail, or pay them to our agents, of whom a list is given in our last page. Those who wish to consider the twelfth volume as paid for in advance will please to remit a three dollar bill, and the 50 cents shall go towards pay for the next volume.

There are some, who may perhaps receive their bills, who have recently paid our agents. If so, they will please to make allowance for our not being apprised of such payments.

We would merely add that we send bills to some who have been punctual in their payments. We do this that they may know the date of their bills; and shall hereafter forward to every individual his accounts once a year. Those who have been indebted more than two years, and do not now remit the sums due will have their bills sent again. That's all, at present. Those who owe for five years or more, must now make it convenient to assist in settling their accounts.

If every one of our subscribers would be so obliging as to procure one in addition to our list, (which he is hereby authorised and requested to do), our establishment, and we trust the Public, would thereby receive benefit more than equivalent to compensate his exertions.

GREAT CROPS OF INDIAN CORN.

Piermont, N. H. Nov. 28, 1833.

MR. FESSENDEN—Sir, I have read with much interest the letter of Mr. Coleman of Deerfield, Mass. republished in your paper of Nov. 20, from the New York Farmer, on the quantity of Indian corn to the acre. And in looking over the list of large crops here presented, I inquire, how is it that an hundred and seventy bushels of corn can be produced on an acre of ground, as given in the case of Messrs. Pratt of Easton, Bartlett and others; or even the smaller crops of 150, 142, 120, or 100 bushels an acre? Now, sir, the intervale lands on the Connecticut river, in this vicinity, are fertile, and produce corn abundantly, but we see no crops so large as those above recited. Is this difference wholly for want of cultivation?

I shall feel greatly obliged to Mr. Coleman, or to any one acquainted with the facts, to point out particularly the mode of culture in raising these large crops, that we may more readily imitate them, should the practice be consistent with safe and prudent husbandry. I think it would be very useful to the community, and certainly interesting to many individuals, to see a description of the mode of farming practised by Mr. Stimson, on his farm at Galway for a few years past, especially in relation to the culture of corn. This crop is becoming more important in proportion as the crops of wheat decrease. And we have many intelli-

gent farmers, who doubt the practicability of raising 100 bushels of good merchantable corn on an acre of ground in one season.

Frequent descriptions of successful culture in important and necessary crops are among the most useful communications to the public. And if it should be said that an account of the manner of raising some of the crops above mentioned has been given, which I do not recollect, yet we cannot be too well acquainted with a course of farming which shall produce such important results.

Respectfully yours,

J. S.

BY THE EDITOR. We should be very grateful to Mr. Coleman for any attention he may be good enough to give to the above request. The very great difference between the crops above referred to, and the largest which farmers in general are able to obtain has often been considered a mystery, the solution of which is very desirable. Probably much depends on the kind of seed corn. Other things being equal, that seed corn would prove most productive which had been selected in the field from stocks producing two or more ears. Corn planted in drills will also produce more on an acre than that which is planted in hills. Many other requisites to obtain a pre-eminent crop must also not be omitted, if we intend to enter the lists, as competitors with the wonder-working cultivators above mentioned. We premise this by way of stating the case, and hope Mr. Coleman will give the cause to the country.

For the New England Farmer.

NEW PLANTATIONS ON THE SEA SHORE.

MR. FESSENDEN—The following, from De Candolle's *Vegetable Physiology*, points out a method of arresting the progress of desolation occasioned by the motion of shifting sands in an open and sandy region. There are districts of country in New England on the sea shore, where this method of improvement may be of essential use.

And it may also be worth while for proprietors of naked fields near the shore to consider whether by adopting *Bremontier's* plan of planting new forests, or at least broad belts of trees as a defence against the tempestuous, inclement sea winds, a considerable melioration of climate and a more certain production of fruit and vegetable crops, may not be had; and at the same time an income obtained from the pines and other trees more than the cost of rearing the wood?

The eastern shore, and indeed the greater part of Cape Ann, has a desolate appearance for want of trees. It would be an error to suppose that, by its abounding in great masses of naked rock it is condemned to hopeless sterility. Some of the most fertile and picturesque country in the vicinity of Boston would exhibit an aspect as unpromising as Cape Ann, if denuded of shrubs and trees, and shown in the deformity of its rough and bristled surface of native ledges. The inland shore of Cape Ann presents to the eye of the traveller, in passing from *Sandy Bay* to *Gloucester*, a succession of neat and highly cultivated little farms, whose luxuriant grass fields and thriving trees, show plainly that the rich manures yielded by marine substances, have been bountifully used.

Cape Ann, with a broad belt of forest on the outer sides toward the sea, would acquire a new climate and a new agricultural character. Divided

into moderate farms, with neat white cottages, the human habitations of that most industrious thriving and intelligent people, the citizens of Gloucester, who drive with untiring assiduity a good trade with the most remote regions of the earth, Cape Ann would become one of the most productive and tasteful regions of the United States.

To the advantages of a strong soil and an inexhaustible treasury of manures, there is enterprise and money enough to spare in Gloucester to set on foot plantations for shelter, for fruit and for timber on an extensive scale. One is delighted in visiting the island of Nantucket, to see how much has been done by the hardy and respectable inhabitants to put the best face upon this dreary sand island.—They are the very people to turn to account *Bremontier's* successful experiments.

"*Bremontier's* plan is wonderful for its great simplicity. He sows, in the dryest and most shifting sand, the seeds of the broom (*Genista scoparia*), mixed with those of the sea pine (*pinus maritima*), and then covers over the spaces that are sown with branches from the nearest pine forests, by which means the sand is to a great extent prevented from shifting. The broom springs up first, and thus serves the double purpose of further restraining the sand, and nursing the young pines. The latter grow for seven or eight years under the shelter of the broom, whose foliage becomes mingled annually with the sand, which it thus partially fertilizes. After this period the pine overtops the broom, and frequently entirely kills it with its shade. In ten or twelve years the rising forest is thinned for the manufacture of tar, and for procuring branches to cover the newly sown districts. These forests placed on the drifting sand-hills along the sea side, shelter the whole country behind them from the continuous action of the sea winds; and thus, while themselves yield a supply of an important article of commerce, they protect the produce of the rest of the country. It is highly desirable that this prodigious undertaking, the most splendid agricultural enterprise of our age, should gradually be completed, and thus provide a shelter for the whole district between the mouths of the *Adour* and *Garonne*."

"I have herborized during a whole day in these forests sown by *Bremontier* on perfectly dry sand, on which before his time there could scarcely be seen a trace of vegetation."

SMOKING CHIMNIES ALTERED.

MR. ISRAEL KEYES, has discovered a method of making chimnies carry smoke, which have hitherto been defective in that important requisite. We have given some attention to his mode of effecting this desirable object, and believe it to be caused by a scientific application of the principles of pneumatics to its attainment. We have also seen a certificate, signed by a number of very respectable gentlemen of this city, stating that Mr. Keyes has been perfectly successful in altering their chimnies, which had been accustomed to smoke, in such a manner as to give them a perfect draught. Mr. Keyes is entitled to much credit for his discovery, which many philosophers have sought for and attempted with but partial and uncertain results.

In a part of this impression, the Engraving on the first page was reversed by mistake.

MISCELLANY.

From the Amaranth.

BURNING LETTERS.

BY MISS H. F. GOULD.

FIRE, my hand is on the key,
And the cabinet must open!
I shall now consign to thee
Things of grief—of joy and hope.
Treasured secrets of the heart
To thy care I hence entrust,
Not a word must thou impart.
But reduce them all to dust!

This—in childhood's rosy morn,
It was gaily filled and sent,
Childhood is forever gone!
Here! devouring element.
This was friendship's cherished pledge—
Friendship took a colder form;
Creeping on its gilded edge.
May the blaze be live and warm!

These—the letter and the token
Never more must meet my view:
When the faith has once been broken,
Let the memory perish too!
Here comes up the blotted leaf,
Blister'd o'er by many a tear!
Hence! thou waking shade of grief!
Go, forever disappear!

This was pen'd while purest joy
Warm'd the breast and lit the eye,
Fate that peace did soon destroy;
And its transcript, so must I!
This must go! for, on the seal,
When I saw the solemn yew,
Keener was the pang than steel—
'Twas a heart-string snap'd in two!

This—'tis his who seem'd to be
High as Heaven, and true as light;
But the visor rose: and he—
Spare, O mercy! spare the sight
Of the face that frown'd beneath—
While I take it, hand and name,
And entwine it with a wreath
Of the purifying flame!

These—the hand is in the grave,
And the soul is in the skies,
Whence they came!—'tis pain to save
Cold remains of sundered ties!
Go, together all, and burn,
Once the treasures of my heart!
Still, my breast shall be an urn
'To preserve your better part!

From the People's Magazine.

TOOTHACHE.

THE toothache is rendered more distressing, if not more acute, by there being no commiseration for the wretchedness it occasions. The belief in this, and a keen recollection of bodily and mental sufferings, have produced the following little narrative:

Some years ago, a tremendous tooth, with three enormous prongs, confined me to my room, and irritated me to a state but little short of distraction. With my head tied up in a bandanna handkerchief, both hands on my afflicted jaw, I sat swaying my body to and fro, as if endeavoring to calm a fractious infant; at other times I stamped about like a lunatic, or plunged on my bed like a frog swimming. Being at length reduced to a state of exhaustion, I was anxious to retreat from all inter-

course with the world; yet knock after knock at the door continued, as if only to increase my already excessive nervous irritability. Many of the persons I had no desire to see, but some were those interwoven with my professional pursuits, and I was compelled to be at home. I had to account for my disconsolate appearance—to describe my tormenting pangs, till I was weary of speaking upon the subject.—To all my fervid description, I received the cold remark, and the chilling advice, that it was *only* the toothache, and that I had better have it *extracted*. All this time, the salivary glands were pouring their fluids into my mouth, the gastric juices were wasting their powers, and I was in a paroxysm of excruciating anguish. It was astonishing how persons could calmly behold such a complication of miseries. Nothing could be eaten; slops became offensive; the sight of a spoon frightful; and a basin revolting as a perpetual blister. Even the air could not be taken!—it was too much for the petulance of my capricious tooth. On it raged, as if torments were its delight. In all my reading, I never met with any author but Burns who had a proper idea of the toothache. He wished his enemies to have it for a twelve-month. Oh dear! he must be more or less than man who could endure this. He must despair and perish.

How true is it, that out of evil often some good will spring; for while I was enduring this thumb-screw on my gums—this gout in my jaw—this rack of nerves, this destroyer of brains—amid this desolation I acquired much useful information respecting the toothache. One friend informed me that half the suffering was occasioned by a nervous irritability; for, if I went to a dentist with a determination to have the tooth extracted, the moment I entered the door the tooth would cease to give me pain.—He had proved it more than once.

Another friend smiled at my deplorable situation, and laughed at my desire to retain in my mouth such a *thing*, that had ceased to be a tooth; it is a mere stump, with a carious triplex fang; worse than useless; it was positively injurious. If the case were his, he should give such tenant immediate notice to quit. With a pair of pincers he would serve the ejectment himself, as an empty house was preferable to a bad tenant.

Another friend requested me to be careful in selecting an operator on my tooth, for that he went to a dentist once, under anguish scarcely endurable, to have a large double tooth like mine extracted. He made a round O on his mouth; the operator popped in the instrument, and u-g-h—a-h—it slipped. He felt as if a loaded wagon had passed over his head. The dentist apologized, saying, "It was a common occurrence; gentlemen did not mind it much because the next attempt was always successful."

A gentleman who had been waiting for me in the parlor was now introduced, who exclaimed:

"My dear friend, I can cure you in ten minutes."

"How? How?" inquired I: "do it in pity."

"Instantly," said he.

"Have you any alum?"

"Yes."

"Bring it, and some common salt."

They were produced; my friend pulverized them, mixed them in equal quantities; then wet a small piece of cotton, causing the mixed powders to adhere, and placed it in my hollow tooth.

"There," said he; "if that do not cure you, I

will forfeit my head. You may tell this in Gath, and publish it in the streets of Askelon; the remedy is infallible."

It was as he predicted. On the introduction of the mixed alum and salt, I experienced a sensation of coldness, which gradually subsided, and with it the torment of the toothache.

ADVERSITY.

THOUGH foul be the lightnings, they freshen the air, Though rough be the tempests, the ocean they clear, The herb which is bruised sheds the sweetest perfume, The glow-worm shines brightest when deepest in gloom, And the stars which gleam forth on the bosom of night, From the darkest of heaven, give fairest the light.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of *new celebrated Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Mountain and Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st. sept 11 eow6w

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NO. 24.

MIDDLESEX AGRICULTURAL SOCIETY.

REPORT ON FARMS, &c.

The Committee on Agricultural Experiments, Farms, Shrubs, Fruit and Mulberry Trees, have attended to the duty assigned them and ask leave to report:

THERE were but two applicants for the Society's Premiums on Farms, viz:

*Abraham How, of Marlborough,
Abel Moore, of Concord.*

We, the undersigned Committee, feeling ourselves incompetent to do any thing like justice so important a station, yet we are unwilling to refuse our services in the cause of Agriculture; it being of vital importance to the growth of any nation.

Mr. How's Farm contains 117 acres, well proportioned with the various kinds of soil, which are necessary to make a farmer more active. This farm, purchased by Mr. How about 40 years ago was destitute of fences, except brush and wood; and the buildings nearly decayed; and not more than one ton of English hay cut on the farm. By the industry and hard labor of Mr. How, the farm now is in good state of cultivation, with 933 rods of wall, 400 rods of ditches, a large house, 2 barns, sheds and out buildings, necessary for a farmer, built by Mr. How; a good stock of cattle, and now cuts 20 tons of English hay, 10 tons of meadow hay; grain and other produce in proportion. The improvements on this farm have been made chiefly by draining the low lands, and taking the manure from the ditches and putting it on the high land, previously passing through the cow and hog yards, and also by levelling with hoes rough and boggy land, and covering the same with sand or gravel, manure and hay-seed; which your Committee think far better than ploughing where the soil is wet and heavy. The labor that has been performed on the farm was chiefly done by Mr. How's own hands and team. We are of the opinion, that much of the labor on the walls must have been done at a season of the year, when many other farmers have been sheltered from the severity of the cold. We cannot select any part of the farm as having any extraordinary mode of cultivation; but each part has been made subservient to the benefit of the whole. By a long and steady course of industry and good husbandry, the farm which was of little income, has now become a profitable field. The labor of cultivating and gathering the crops are performed by Mr. How and a boy with a team; it is now a very productive farm according to the labors.

Mr. Moore's Land, which we have examined, is about 60 acres, chiefly swamps and meadow land. In 1826 the produce was equal to keeping one cow. In 1830, 1831, 1832, and 1833, there were from 40 to 50 tons of English hay cut annually. This land lies about half a mile east of Concord meeting house, and is known to a large portion of the county. The mode of cultivation has been first by taking from the soil from 6 to 10 inches, then levelling with sand or gravel, and spreading manure; second, by ploughing and hoeing; third, by levelling the ground with the hoe and covering with sand or gravel and manure. The last mode is thought to be the best; it being less labor, and

frequently covering it with a little gravel and manure, it will always hold good. Some of this land is worth from 100 to 150 dollars per acre; bearing from 1½ to 2½ tons per acre, which for seven years previous the income was not one cent per acre. It is difficult to ascertain the expense of reclaiming an acre of this land; but no man need fear to undertake, for it will amply compensate him for his labor. Your Committee are of opinion, that if more labor was laid out on swamps and meadow lands, that do not produce any wood, and less on high and rocky land that might produce wood, it would be much for the interest of the farmer and country at large. Although but few applications were made us to examine farms, your Committee did not pass by any without casting an eye on them; they are happy to say that many of the farms made a fine appearance, and as they had two premiums not disposed of, they would have been willing to have awarded them if application had been made. There were many farms which needed great improvements, and the Committee would recommend their owners to double their diligence, that they may obtain premiums; they would also strongly recommend to farmers and all others a little attention to their door yards, and the highway near their houses. A little time spent in removing such things as are not necessary, would add much to the appearance of the situation, and to the convenience of their visitors.

The applications for premiums on Fruit Trees were four, viz:—

*James Eustis, of South Reading,
Asa Parker, of Acton,
Robert Chafin, of Acton, and
Darius Hubbard, of Concord.*

James Eustis had 150 apple trees, set in 1826, 1827 and 1828, in a thriving state generally; had been well pruned, bid fair for very fine trees. Much skill had been used in shaping the tops of the trees.

Asa Parker had 125 apple trees, set in 1827 on the easterly side of a large swell of land; the trees are on a good soil, and in a thriving state; they have been neglected in some measure as to being pruned, but they bid fair to make a fine orchard.

Robert Chafin has an orchard of 115 trees, generally in a thriving state; the situation is well chosen, being on the southerly side of a rise of land.

Darius Hubbard has the largest orchard we examined, containing 300 trees on a very rich soil on the westerly side of a large hill; the trees are not in so flourishing a state as others we visited, owing partly to the quality of the trees when set, partly to the want of cultivation and pruning; but by attention for 2 or 3 years it may be made one of the finest orchards in the county. There appear to your Committee to be two very important things respecting an orchard, which are not well attended to; one is the selection of the trees; none should be set excepting those which are straight and have smooth bark; the other is the pruning the trees and keeping them in proper shape.

Your Committee are of opinion that sufficient attention has been generally paid to manuring, and perhaps too much; for, by forcing the growth of

the tree, there is danger from the early cold in the fall. The wash that is generally used, and which your Committee think is best, is a strong lye made from ashes or potash. The orchards that we have examined have been grafted generally in the nursery.

Your Committee had but one application to look at Mulberry Trees; that was from *Anthony Wright, of Concord*. He has 200 trees, set in 1828, 70 of them are very large; in 1832, 130 were set; and a nursery of about 6000 planted. These all look in a thriving state and much improved the year past; part of these trees stand in a light soil, but they are thrifty and in a flourishing state. Mr. Wright has spent much time in cultivating these trees and gaining information upon the subject of the Mulberry tree, which knowledge he is ready to communicate to others. Your Committee would recommend the culture of the Mulberry tree. At no distant period it will be one important branch of agriculture. It can be performed with little hard labor.

The Committee award the following premiums:
Abraham How, Marlboro', for the best farm, \$25
Abel Moore, Concord, 2d best, - - - 20
James Eustis, South Reading, best orchard, 15
Asa Parker, Acton, 2d best, - - - 12
Robert Chafin, Acton, 3d best, - - - 6
Anthony Wright, Concord, for the best Mulberry trees, - - - 25

Your Committee close their services with their best wishes for the success of the agriculturer, knowing in his hand are the destinies of the nation.

Respectfully submitted,

JAMES BROWN,
BENJ. DIX.

Concord, Oct. 2d, 1833.

From the Genesee Farmer.

THE CORN HUSK MATTRESS.

THE season is now approaching when farmers will have leisure to prepare mattresses from Indian corn husks. Except in winter, these are much superior in our estimation, to feather beds, as being more conducive to comfort and to health; and for the information of such readers as are not skilled in the manufacture, we have prepared the following directions:

Take bright clean husks, and separate them from each other. Trim them neatly at each end with the shears; and pass them in little bunches, one at a time, through a fine hatchel, exactly in the manner that we hatchel flax.

When the mattress is to be made up, spread the tick on the floor, and over rather less than one half of it, scatter the shreds of the husks evenly, making them lie across each other, as much as possible in every direction. This not only renders the mattress more elastic, but the shreds are less liable to collect into wads. When the whole quantity intended, is scattered in this manner, turn over the upper fold of the tick, and secure it by sewing. A few bits of strong twine, as in curled hair mattresses, should be passed through in different places to keep the shreds from shifting.

We have tried stuffing the mattress by handfuls, after the tick is made up, but we prefer the mode which we have recommended.

This manufacture may serve as a preventive against drowsiness in the long winter evenings.

THE LARGEST TREE IN THE WORLD.

THE boabab or monkey-bread (*Adansonia digitata*) is the most gigantic tree hitherto discovered. The trunk, though frequently eighty feet in circumference, rarely exceeds twelve or fifteen feet in height; but on the summit of this huge pillar is placed a majestic head of innumerable branches fifty or sixty feet long, each resembling an enormous tree, densely clothed with beautiful green leaves. While the central branches are erect, the lowest series extend in a horizontal direction, often touching the ground at their extremity; so that the whole forms a splendid arch of foliage, more like the fragment of a forest than a single tree. The grateful shade of this superb canopy is a favorite retreat of birds and monkeys; the natives resort to it for repose, and the weary traveller in a burning climate gladly flies to it for shelter. The leaves are quinate, smooth, resembling in general form those of the horse chestnut. The flowers are white and very beautiful, eighteen inches in circumference. The fruit, which hangs in a pendant manner, is a woody gourd-like capsule with a downy surface, about nine inches in length and four in thickness, containing numerous cells, in which brown kidney-shaped seeds are embedded, in a pulpy acid substance. The timber is soft and spongy, and we are not aware that it is used for any economical purpose. It is very easily perforated, so that, according to Bruce, the bees in Abyssinia construct their nests within it, and the honey thus obtained, being supposed to have acquired a superior flavor, is esteemed in preference to any other. A more remarkable excavation is however made by the natives; diseased portions of the trunk are hollowed out and converted into tombs for the reception of the bodies of such individuals as, by the laws or customs of the country, are denied the usual rites of interment. The bodies thus suspended within the cavity, and without any preparation or embalment, dry into well preserved mummies. The juicy acid pulp is eaten by the natives, and is considered beneficial in fevers and other diseases on account of its cooling properties. The duration of the boabab is not the least extraordinary part of its history, and it has given rise to much speculation. In it we unquestionably see the most ancient living specimens of vegetation. 'It is,' says the illustrious Humboldt, 'the oldest organic monument of our planet; and Adanson calculates that trees now alive have weathered the storms of five thousand years.'

Ed. Cab. Lib.

From the Genesee Gazette.

STATE OF AGRICULTURE.

WE have selected an extract, from "James Stuart's three year's travels in North America." We have visited Mr. Stimson's farm, and can attest to the truth of its being well cultivated. If the wealthy farmers in Genesee Co. would pay as much attention to their farms, as Mr. Stimson does to his, they would be more profitable than his, as the land is certainly better.

"On the 18th of November, made an excursion to the township of Galway, with a view to see Mr. Stimson's farm, about eleven miles from Ballston Spa. Mr. Stimson is a very enterprising person, has an extensive farm, a large hotel, and great stores as a merchant. We are told that there is no farm within our reach at present, so well entitled to notice. Mr. Burtis, our Saratoga charioteer,

carried us to it. We were unlucky in not finding Mr. Stimson at home, but Mrs. Stimson was extremely communicative and obliging, most especially considering that we had no introduction to her.

The situation of the farm is very elevated, with the highway running through it. Of 800 acres, of which the farm consists, Mr. Stimson has about one half in cultivation. His fences, horses, farm-houses, and the whole establishment, are good, and in good order; and there is an appearance of activity and attention about the place that would do credit to the agriculturist of any country.

The whole land has been improved by Mr. Stimson; it is laid off in fields of about eight acres, enclosed with stones gathered from the land in the lower part of the fence, and a frame of wood on the top of them. There are two rails above the stone, and about twenty miles of this sort of fence.

The soil is generally light, but Mr. Stimson manures, though perhaps not so much as might here be done with advantage, yet a great deal more than most farmers in this country, and of course raises better crops. His general rotation is, 'Maize, or Indian corn, with patches of potatoes or turnips on the edges of the field; 2 Barley, or sometimes oats; 3. Wheat in which he sows five pounds clover seed, and two quarts timothy per acre. Then he cuts the timothy for two years and pastures for one. He breaks up the pasture for wheat, then takes a crop of maize and follows the above rotation, manuring either on breaking up or with the maize. Land is less overrun with weeds here than in Britain, and for some time after being cleared, much richer in point of soil. In this view the rotation by which crops of grain are taken consecutively may admit of justification to some extent. Yet I cannot but suspect that the return would, on the whole, be greater if the manure was always applied to the maize or green crop, followed by only one grain crop of wheat, or oats, or barley, with which grass seeds are sown. The land would thus constantly be clean, and in good tilth, and the lesser number of grain crops would be compensated by their superior quality.

Mr. Stimson has reported his produce from eighty-five acres to be what follows, after actual survey and examination; and while he can obtain such a return, he is well entitled to adhere to his own system.

| | |
|-------------------------------------|---------------------|
| 10 acres of Orchard ground produced | 25 tons hay |
| 8 do. Maize, | 560 bushels |
| 8 do. do. | 720 do. [hay |
| 10 do. do. | 300 do. and 16 t. |
| 4 do. Wheat, | 140 do. |
| 1 do. Flax, | 600 lbs. |
| 8 do. Oats, | 560 bushels |
| 8 do. Hay, | 32 tons |
| 8 do. do. | 36 do. |
| 1 do. Barley, | 60 bushels |
| 3 do. Hay, | 10 1-2 tons |
| 4 do. do. | 12 do. |
| 8 do. do. | 24 do. |
| 2 do. | 1000 bush. potatoes |
| 2 do. in vegetables raised | 400 chickens. |

Mr. Stimson has gained almost all the agricultural premiums in the county; for having the best managed farm; for having raised sixty-two bushels of barley on an acre; for having raised 357 bushels of potatoes on half an acre; and for having raised 5 tons of timothy hay per acre.

The field of maize on this farm, when well hoed and cleaned by the plough, cannot fail in summer to give a very gay appearance to the field,—even superior to that of the best dressed green crops to which the eye of a British farmer is accustomed; but at this season, the want of those green crops of turnips, mangel wurtzel, ruta baga, &c. which, as well as potatoes, are only raised in small portions in the margins of the fields, creates a great blank. The maize is the great article used not merely as the cleaning crop, but for feeding horses, cattle, and poultry, for which it is admirably adapted.

When we returned from the fields, we found a very nice dinner prepared for us, and a bottle of wine on the table. Mrs. Stimson had previously dined, but gave us the pleasure of her company; and was, I believe, not less inquisitive in putting questions to us respecting land. The county of Onondaga will fully sustain her rank among the counties of the state, leading perhaps the van, as of right she may claim to do, in the march of agricultural improvement.

FRANKLIN ON SWIMMING.

WHEN a swimmer is seized with the cramp in the leg, the method of driving it away is to give the parts affected a sudden, vigorous, and violent shock, which he may do in the air, as he swims on his back.

'When I was a boy, I amused myself one day with flying a paper kite; and approaching the banks of a lake, which was near a mile broad, tied the string to a stake, and the kite ascended to a very considerable height above the pond, while I was swimming.—In a little time, being desirous of amusing myself with my kite, and enjoying at the same time the pleasure of swimming, I returned, and loosing from the stake the string with the little stick which was fastened to it went again into the water, where I found that lying on my back and holding the stick in my hand, I was drawn along the surface of the water in a very agreeable manner.

'Having then engaged another boy to carry my clothes round the pond, to a place which I pointed out to him on the other side, it carried me quite over without the least fatigue, and with the greatest pleasure imaginable. I was only obliged occasionally to halt a little in my course, and resist its progress, when it appeared that by following too quick, I lowered the kite too much; by doing which occasionally I made it rise again. I have never since that time practised this singular mode of swimming, though I think it not impossible to cross in this manner, from Dover to Calais. The packet boat, however, is still preferable.

DIVING, by practice, may be carried to astonishing perfection. Pearls are brought up from the bottom of the sea by divers, who are trained to remain a considerable time under water. In ancient times, divers were employed in war to destroy the ships of the enemy; and many instances are related, by respectable authors, of men diving after, and fetching up nails and pieces of money thrown into the sea, and even overtaking the nail or coin before it has reached the bottom.

Diving may be performed from the surface of the water when swimming by merely turning the head downward, and striking upward with his legs. It is, however, much better to leap in with the hands closed above the head, and head fore-

most, from a pier boat, or raised bank. By merely striking with the feet and keeping his head toward the bottom, the diver may drive himself a considerable distance beneath the surface. In diving, the eyes should be open; the breath should be held.

TO TREAD WATER.—All that is necessary for treading water, is to let your legs drop in the water until you are upright; then keep yourself afloat in that position by treading downward with your feet, alternately; and, if necessary, paddling with your palms at your hips.

GARDEN RASPBERRIES.

Garden Raspberries should be pruned in autumn or in the early part of winter, and then tied up to good stakes. We will explain the reason of this practice. By pruning at the height of four or five feet, according to the strength of the stem, it has fewer branches to support in the following season; and all the nourishment, derived from the root being turned into these, they grow more vigorously and produce finer and larger fruit. For the same reason we recommend that not more than four or five stems be retained for each root.

But there is another consideration in favor of this practice. In one of our northern winters deep snow-drifts are often the consequence of an eddying wind over the garden fence; and though under these, the unpruned, bending and straggling stems of the raspberry may safely repose for a while; yet when a thaw commences, the lower part of the snow settles and the incumbent mass no longer supported, crushes the stem, not unfrequently snapping and separating it from the root. Such disasters are prevented by tying the stems in an upright position to a stake.

The insky flavor of the Antwerp Raspberry is not relished by some persons. It was so at first with ourselves; but with a little use it became the most pleasant of all the kinds. The stems in bleak situations, are often injured in the winter. One of our friends after pruning, has had them regularly cased in straw on the approach of severe weather, though we think it probable that the bows of evergreens would be more effectual. Another friend of ours, has them planted on the west side of his garden where they are sheltered from the cold winds; and in no ordinary winter have they sustained any damage.—*Genesee Farmer.*

ANIMAL FRIENDSHIP.

"In the war in Spain some years ago, two horses had long served together in the same brigade of artillery. They had assisted in drawing the same gun, and had been inseparable companions in many battles. One of them was at last killed; and after the engagement the survivor was piquetted as usual, and his food brought to him. He refused, however to eat, and was constantly turning round his head to look for his companion, sometimes neighing as if to call him. All the care that was bestowed upon him was of no avail. He was surrounded by other horses, but he did not notice them; and he shortly afterwards died, not having once tasted food from the time his associate was killed."

NATURAL HISTORY.

The Candle-Berry Tree of Carolina.—The "Veg-etable World," an old book, republished by Mr.

Dow, has many interesting things in it. Among others, we find the following curious account of the Carolinian candle-berry-tree, which seems to us to resemble very strongly, the bay-berry, or tallow tree, of the sea coast of New England.

"In November, when the berries are ripe, a man with his family will remove from home to some island, or sand-bank, near the sea, where these berries abound, taking with them kettles, to boil the berries in. He builds a hut with palmetto leaves, as a shelter, during their stay of four or five weeks. He cuts down the trees; the children strip off the berries and throw them into the vessels; and, on their being boiled, oil rises to the surface, which, when cold, hardens to the consistence of wax. It is afterwards purified in other vessels; and candles made of it, burn a long time, and yield a grateful odor."

SMUT IN WHEAT.

Mr. G. Yuill gives the results of eleven experiments in sowing clean and smutty wheat. The general conclusion seems to be, that wheat, known to be perfectly clean, should be kept dry, and sown in a very dry state. That which is washed and limed should be well dried. The object in drying the grain is to deprive the smut of moisture for its nourishment.—*N. Y. Farmer.*

From the Maine Farmer.

EXPENSE OF KEEPING STOCK.

MR. HOLMES—Enquirer wishes to know if there is not some error in public opinion, respecting the expense of keeping stock. So far as I have heard observations made on this subject, they go to show that it is believed that the expense of keeping depends on the size of the animal. This I doubt. Some sorts eat more than others, though of less growth. As to the same species, I believe there is no great difference in the quantity of food required. A small man, for aught that I have observed, eats as much as a large one. So with other creatures. Age and climate may make a difference, and no doubt do, more than size. I make these remarks to bring the subject forward for discussion; for if I am right, we need not fear to cross and enlarge our stock of all kinds.

BLOWING GLASS.

DURING the past week we have had an opportunity of inspecting a newly invented instrument for blowing glass, now in successful operation at the works of Messrs. T. & J. Robinson, in this city. This invention we consider one of the greatest and most fortunate of the age, as the action of the lungs in blowing, is almost entirely dispensed with—saving, no doubt, many valuable lives. Besides its merit in this respect, it has, likewise, the advantage of being exceedingly simple and cheap in its construction, the whole cost of making and fitting up, not exceeding one dollar. As we have learned that it is the intention of the proprietors to take out letters patent, we do not feel at liberty to give a description of the article.

Penn. Advocate.

THE WHOLE HOG.

A porker was raised in this town during the past season, touching which we have the following particulars: Weight, March 25th, 75 pounds; weight, December 16th, 470 pounds—increase in 267 days, 295 pounds—or 23 1-2 ounces per day. Average of corn consumed per day, 4 1-2 pints.

Nantucket Inquirer.

From Goodsell's Farmer.

A SWINE'S ATTACHMENT TO ITS BIRTH PLACE.

MR. GOODSSELL—I sent a short article to the New York Farmer, on the instinct of Swine.

I referred to the forcible return of a sow (which I had sold to my neighbor) to litter near her own birth place, and where she had littered before. I will add the following remarkable fact:

After littering, the sow and pigs were driven to the premises of my neighbor, the purchaser. But it was with difficulty that she could be kept from the lot which was her birth place, at this critical period; though she had been kept on my neighbor's premises, and much better fed there than I fed her, for about nine months. She was continually seen looking wistfully towards her birth place, and seeking every means for conveying her family back. Her pigs being too young for the journey, she often came alone, and slept whole nights in a shed on the premises, and seemed to return to her pigs "as if under the sense of duty, but with a heavy heart." She moaned (as far as a hog can moan) and grieved and pined away by degrees under the best of care, and without any apparent disease.

At last she crept into a shed on the premises on the last night of her life, and died in the morning, without returning to visit her pigs in her usual manner. If a hog can die of a broken heart, this was surely a case.

Since this occurrence, I have been told by several farmers that this is not an uncommon case, and that a sow must be indulged at and after her littering period, or she will thus pine away and die, or suffer much in health in most cases.

AMOS EATON.

Troy, (N. Y.) August 15, 1833.

GREAT CURIOSITY.

MR. B. PRITCHARD advertises himself in the Cincinnati papers as "the living Mammoth of the West." He is a Kentuckian, 43 years old, six feet two inches high and weighs 500 pounds—measures six feet five inches around the waist, five feet ten inches around the shoulders, and believes himself to be the largest man in the world.

PROFESSOR HENRY'S MAGNET.

AN artificial magnet has been constructed by Professor Henry, of Princeton College, which far surpasses in power every thing of the kind. A number of interesting experiments on the subject of electro magnetism, were exhibited by means of this wonderful instrument, in the presence of the students, and a large number of gentlemen assembled to attend the late commencement.

Upon one trial of its strength, it was found to be capable of raising between three and four thousand pounds; and we learn with further modification of the apparatus, the magnet will be able to sustain upwards of four thousand pounds.

Professor Henry has also made important improvements in the Galvanic Battery, when it is applied to the production of a magnetic power. The particulars of this improvement we are unable to explain, but for the sake of science, we hope that this gentleman will soon give to the public a full account of these improvements, and of their important results.—*New York Standard.*

TURNIPS

—Or any sort when fed to Milch-cows, must always have their tops first taken off, as they impart an unpleasant taste to the milk and butter. The tops may be given to other cattle.

From the New York Farmer.
USE OF THE TOMATO

IN QUICKENING THE ACTION OF THE ABDOMINAL
VISCERA.

Like most persons of studious or sedentary habits, I often am more or less incommoded, and my health impaired, by inaction of the stomach and bowels, so as to be under the necessity of resorting to medicine, principally cathartics. In order to enable our readers perfectly to appreciate what I am about to say of a remedy, this state of the bowels is always in some degree accompanied with a sense of straitness of the chest, and besides a general uneasiness, and lassitude, yet with the head ache, or some degree of pain in region of the liver. It seems to me a recurrence of those symptoms that accompany attacks of what is called by my physicians, a liver complaint, to which I have been a good deal subject. The appetite instead of being keen becomes imperfect, with a peculiar taste of the mouth, as if something was wanting, and in the functions of digestion, to constitute perfect health, for which cathartics are only a temporary relief, not a remedy.

The common *Tomato*, used in making gravy, at once removes this taste of the mouth; in a little time quickens the action of the liver, and of the bowels, and removes all the above noticed symptoms and feelings. I regard it as an invaluable article of diet, or, if you please, as of medicine, or of medical dietetics. With me it has always been my object of solicitude, to find out such diet, as should supersede the necessity of medicine. Except in pickle, which I cannot use, I eat the *Tomato* in every imaginable mode of dressing, and find it perfectly adapted to my wants. In the hope of being of some use to others, these facts are stated. The *Tomato* is of great use to me. It is raised with less trouble than any other vegetable that I have any knowledge of. It was first planted six years ago, drops its own seed into the ground, and has produced bushels, every year since, with no other trouble than once digging the same ground, in spring, and one or two hoeings, on a spot of perhaps six feet square. It makes a good pickle, and is raised with one hundredth part the labor and trouble of an equal quantity of cucumbers. But, one other object remains to be stated. I incline to the opinion, though without having yet fully tried it, that the *Tomato* may be made into a rich sauce, for meat, and be kept through the year, or from season to season of the fruit.* The gravy, I know, even in the hottest weather of summer, will keep perfectly unchanged for several days, in a common open dish in a pantry; and this I know, because, as my cook does not like the article, I have contrived to keep it over, when she neglects my directions. If properly prepared, and bottled, and well corked, it would certainly keep good, in an ice house, or perhaps in a common cellar, or under water, of a low and uniform temperature. At any rate if found to be as useful to others, as it is to me, it will be quite desirable to find out how it may be best preserved for use. As a pickle kept in brine, or vinegar, I could not use it, and I am inclined to think that its good qualities would be much diminished, for any one, by this mode of preservation. It seems to me, that, of all the articles of diet, or medicine, that have come to my knowledge, the *Tomato* acts

most directly upon the liver, and thus on the bile. Publish this if you please, and let others try it, and make their own observations. I know that several persons of my acquaintance have derived a like benefit from the use of it.

Constitutionally predisposed to a torpor of the liver, and the abdominal viscera, I have, through life, been subject to the necessity of using cathartics, until having discovered the good effects of the *Tomato*. In all cases, except in such above described, my flow of animal spirits have always been uniform, rather abundant than otherwise, sustaining severe mental effort, even to 12 and 16 hours each 24, for weeks in succession, always without other stimuli than ordinary food and drink. Wine never exhilarates, except as it increases my general health; and ardent spirit always depresses the tone of my mind. How far they may be regarded as peculiarities, I know not, but think proper to state them, for the sake of a clear understanding, and in a sincere desire to be useful to others. I have never known the effect, even in the slightest degree, of any sort of intoxicating drinks. Health exhilarates, and ailments depress my spirits.—When afflicted with inaction of the bowels, head-ache, a bad taste of the mouth, straitness of the chest, and a dull and painful heaviness of the region of the liver, the whole of these symptoms are removed by *Tomato* sauce; and the mind, in the course of some few hours, is put into perfect tone, like a new violin. The facts certainly merit a narration, and I can but hope they may be of use to many persons. The true plan of life for men of mind, and especially for men of study, and much mental effort is, so to live, as to have our food supply all that is necessary of medicine. A wise man will soon learn to relish what agrees with his temperament, and reject all else, in food and drink. To which I will only add, that much employment of the mind, particularly in men of slow habits of the body, slow action of the bowels, calls for a larger proportion than they generally use, if temperate men, of liquid food or drink.

From the Boston Medical and Surgical Journal.

USEFUL PROPERTIES OF THE COMMON
ARTICHOKE.

We find among the thicket of dull and speculative essays that crowd the late numbers of the English Medical Journals, a few of rare practical value, which we shall not fail to transplant to our pages. At present we wish to ask the attention of the Faculty to the medical use recently made of the common artichoke. Several cases are detailed in the London Medical and Surgical Journal, in which rheumatic affections yielded very decidedly and speedily to the internal use of the juice of this plant.

The botanical name of this plant, as the reader well knows, is *cynara scolymus*. The leaves should be gathered before their vitality is affected by the frosts. The fibrous and fleshy portions of them should be cut into strips, and by bruising in a marble mortar the juice is readily extracted. In order to preserve this juice, one-fifth part of its weight of alcohol may be added to it, and in this way it is equally valuable for use, if not more so, than when wrought into the more expensive form of extract or tincture.

The efficacy of this medicine in rheumatism has been stated by several medical gentlemen within a few months, and we will content ourselves at

present with offering the 1st and 4th of the cases last published, in the work before mentioned.

"The first case is Elizabeth Harper, ætat. 75, a hale and strong woman, inhabiting a very exposed situation. On June 10th, complained of acute pain in both wrists, which on examination I found to be painful on being touched, and very much tumefied; bowels very regular, free from fever; pulse 80; tongue clean; pain aggravated at night. Gave the following mixture:—R. Succ. cynaræ, 3iv. Syrup. simp. 3ij. Aq. font. ad 3vj. M. Capiat partem iv. am octavis horis.

11th. Pain much relieved; swellings slightly reduced; has passed a better night.—Continue medicine.

12th. Pain has ceased; swellings considerably less, and wrists no longer tender. A gentle aperient was to-day necessary.—Cont. Mist. Cynaræ.

14th. Quite well. The wrists have regained their proper size, and the hands their use. This patient continued quite free from pain until the 3rd of this month (August), when she complained of pain in one shoulder, similar to what she had felt at the wrists, and begged that she might have some more of such medicine as she had had on the former occasion. It was immediately sent to her, and she was relieved as before.

August 3rd. Samuel Fleur, ætat. 36, complains of considerable pain in his right shoulder, which prevents his taking any rest at night, when it appears to be slightly aggravated. Bowels confined; pulse 90, and tongue white. Gave—R. Magnes. Sulph. ʒiiss. Syrup. Sim. ʒss. Aq. Ment. Pip. ad 3vj. M. Capiat coch iij. mag. pro re nata, secundis horis.

4th. Bowels relieved soon after finishing the mixture; pain in the shoulder unabated, limb incapable of being moved from extreme pain and stiffness; pulse 80.—R. Succ. Cynaræ, 3vj. Aq. Ment. Pip. 3vj. M. Capiat part. iv. am nocte maneque.

5th. Relieved; pain in shoulder less; has slept for the first time for three nights.—Perstet.

7th. Gradually improving; bowels in good order; tongue clean, and pulse 70; shoulder less stiff.—Perstet.

12th. Is now so far recovered as to be able to go out to glean corn, and has discontinued medicine.

In more acute cases I have found the same medicine equally useful after bleeding, and in many cases where I had previously given the *Puls. Ipec. c.*, antimonial, and the whole tribe of medicines usually esteemed in the treatment of this class of disease, without effect.

INDIA RUBBER.

We learn from the Boston Centinel that there is a manufactory of India Rubber leather cloth, &c. which employs about one hundred persons. Some years since, an American Chemist discovered a method of dissolving India Rubber and reducing it to a paste, which, being spread with a brush over the surface of cloth, and dried, rendered the cloth water proof. He obtained a patent, and sold it to the Roxbury Company, and is now in their employment. They manufacture beds and pillows without sewing, which a man may almost carry in the crown of his hat, and at night blow them up to any size and sleep on them. They make gas-pipes, engine-hose, garments of every description without stitches or seams, &c. These garments protect the person from rain and storm as complete-

* French cooks have a method of preserving them in the form of cakes first having cut them into small pieces or ground into powder.

ly as if made of iron. They also make many garments of cloth, and then cover them with a coat of India Rubber. This coating can be applied from the thinness of paper to any required thickness. About 40 girls are employed in sewing the garments and applying the rubber. The cloth made entirely of rubber is said never to crack, and of its durability there seems to be no end. The Company cannot half supply the demand, and their shares, which cost 100 dollars each, are now considered worth from 300 to 400 dollars.—*Hampshire Gazette.*

From the Maine Farmer.

PROCESS USED BY C. VAUGHAN, ESQ. IN THE MAKING OF CHEESE.

1st. If possible, to make a cheese at each milking.

2d. To heat a small quantity of the milk, so as to bring the milk taken from the cows to the heat of 96°, which is the temperature of the milk as it comes from the cow.

3d. To use liquid rennet, and to make the cheese of equal quality. The rennet should be prepared the first of the season and kept in small bottles; and it being of equal strength, it ought to be used by measure, according to the gallons of milk to be turned.

4th. When turned to a curd, a wooden knife should be passed across the curd in the tub, and when the whey is properly separated it should be placed in a basket, in which a strainer is first placed.

5th. When strained, it should be broken up into small particles, but not hard squeezed, and then salted, and put into the cheese hoop.

6th. It is then to be put into the press, and the pressure to be gentle at first, and gradually increased, and turned twice each day; the last pressure may be considerable. In this manner the rich part of the cheese is kept in at first, and at the last the moisture is pressed out, which in the common mode is dried out, by time.

7th. The cheeses, after they are taken out, should be put where there is air, and where the flies cannot get to them, and turned and rubbed over twice a day. The outside ought to be rubbed with butter—some use fat pork. The cheeses treated in this manner have been better fit for use in three months, than common cheeses in nine months.

The press best fitted is a lever or beam press made out of timber seven or eight inches square, and ten feet long. The end secured by a strong pin between two upright pieces, and when parallel with the bench it is over, it should be as far apart as to admit the largest cheeses that may be made, with the follower to go under at the heel. The cheese when first put under, should be put as far from the heel as possible and light weighted—every time it is turned it should be put further under, and the fourth time, which is the end of the second day, it should be as near to the heel as possible.

When two cheeses were made in a day, they were put into one press. There is a simple and new kind of press which is said to have the quality of pressing as much or as little as is wanted.

There are several English receipts for preparing rennet. The rennet one season was prepared by soaking the bags in brine, and all the liquor was then mixed and put into small bottles, well corked and kept for use.

TO DESTROY WOODLICE.

PERHAPS in cucumber or melon frames nothing is more destructive than woodlice. Confining a toad in the frame or pit is an effectual remedy for the evil, but many persons would think the cure as bad as the disease itself, for they would be unable to eat the produce, from the recollection that the toad might have touched them. One method pursued with success is to make in the soil, close round the edges of the frame, a kind of hollow, basin about six inches wide, and to fill this up with short hay to about the thickness of two inches. This, in the course of the first night, will become a place of retreat for them, and at about nine or ten o'clock in the morning, having opened the frame pour upon this hay, with a wide nose watering-pot, a considerable quantity of boiling water. Then remove the hay and dead woodlice, and place a fresh supply of dry hay. Repeat this operation for two or three days, and you will see no more woodlice. Another system is to sink a pan half full of water in the soil, its rim being level with the surface, then to throw in a few slices of ripe fruit, and place a slate or piece of pot over it, leaving only sufficient room for the entrance of the depredators. Examine this every morning, and destroy all such as are found therein. The pan may also be filled with hay and pieces of fruit such as apricot, &c. being laid in, they will quickly entice these depredators, which on removing you may destroy. Another very effectual method, is to slice the tuberous roots of the Bryony (*brionia dioica*) a well known plant, and very common in our hedges, and to put a few of these slices into a common feeder, covering them over with a little moss or short hay, and placing them in different parts of the beds. Take out the pans the next morning, and after having removed the moss and baits, cast the woodlice into boiling water.—*Hor. Reg.*

TURNIPS.

WHERE Sheep are a part of the stock of fattening cattle to be fed, during Fall, on the common turnips, a quantity sufficient for them may be left in the ground. Thus, if they are to consume a fourth of the whole crop, leave every fourth row, and by this mean their manure will be distributed more equally over the whole ground. Ruta-baga may also be left in the ground, where Neat-cattle are to feed on them, as the bulb of this root is entirely above ground; and in such case, what is left by them may be eaten off by the Sheep.—*Farm. Assistant.*

TURNIP CULTURE.

I AM so fully persuaded, from the practice of many years, of the great advantage of the turnip culture to our husbandry, especially the sheep farmer, and am so anxious to commend it to particular notice,—on the sensitive ground of profit,—that I venture to give a statement of the expense of culture, of the product, and of the estimated profit, of a patch of ruta бага, the crop of which I have just secured for the winter. I do not vaunt of the product. The crop was but an ordinary one. The result will serve to show, that if the culture is profitable upon pine barrens, it may be rendered more so upon the rich lands of the west.

In the last day of June I gave a good dressing of manure to a sandy ridge, the poorest portion of my farm, from which I had just cut a crop of hay,—ploughed and harrowed the ground and about the 2d of July, put in the seed of ruta бага

with a drill barrow. The culture consisted in passing the cultivator through the crop and in thinning the plants at the first dressing. The crop has been gathered, and the produce found not to vary ten bushels from six hundred. I have to-day ascertained that the ground measures 138 rods, or about seven eighths of an acre. The roots were generally tailed, as well as topped,* which somewhat reduced the measure; but required very little additional labor and rendered them more comely and more valuable—for I consider the tap roots rather prejudicial than otherwise to cattle. The following is a liberal estimate of the expenses of the crop:

| | | |
|---|-------|--------|
| One ploughing, 1 day, | - - - | \$2,00 |
| Harrowing, $\frac{1}{2}$ day, | - - - | 50 |
| Man $\frac{1}{2}$ day drilling in seed, | - - - | 18 |
| Dressing twice with cultivator, half day each time, | - - - | 1,50 |
| Man 5 days twice cleaning and thinning crop, | - - - | 3,75 |
| Do. 5 days in harvesting and securing crop, | - - - | 3,75 |

Total expense of labor, - - - \$11,68
or something less than two cents the bushel.

But if we add,

20 Loads of manure, at 75 cents the load, 15,00

the total cost will amount to - - - \$26,68

for about four cents the bushel. The value of these roots depends upon circumstances. I have sold them in New York at 62 $\frac{1}{2}$ cents. The ordinary price in Albany is 31 cents, and to market-men 25 cents. I consider them worth 18 cents for feeding to stock. At this last price the account would stand thus:

| | | |
|--|-------|----------|
| 600 bushels ruta бага, at 18 cents amount to | - - - | \$112,50 |
| And if we deduct expenses of labor and manure, | - - - | 26,68 |

we have a nett profit of - - - \$85,82

from one acre of land, in a season, two or three tons of tops, which are excellent for cattle, and one half of the benefit of the manure to the succeeding crops, none of which are taken into the estimate.

I venture to add some hints, which may be of service to the novice in the culture of the ruta бага.

1. Do not sow after about the first of July—(June in Maine) as the crop will not come to full growth.

2. Do not sow upon stiff clayey or wet ground—as such soils are not adapted to turnips.

3. Do not sow the Swede upon poor land without a good dressing of manure—because this kind is a strong feeder.

4. Do not leave the plants to stand at a less distance than 8 to 12 inches—otherwise the roots will be of a diminutive size.

5. Do not bury the roots for the winter without giving ventilation in the crown of the pit—otherwise the air in the pit will become warm and vitiated, and rot them. J. BUEL.

Albany, Nov. 15, 1833.

* An English laborer, who assisted in harvesting, performed this operation with wonderful expedition and neatness. I think he would pull, tail and top half an acre of heavy crop in a day with ease. He seizes the top and drawing the turnip with his left hand and while he is raising it perpendicularly from the ground, with a small bill-hook in his right hand, strikes off the tap root and the top with two rapid strokes, and he has hold of another top almost as soon as the root of the first reached the ground.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUIT AT THE MASS.
HORT. SOC. ROOMS.

Horticultural Hall, December 21, 1833.

Apples. Enoch Bartlett, Esq. two different varieties of large White apples, names unknown, of very superior flavor.

Mr. Enoch Silsby, a very large red striped apple, of a flat form, a seedling of superior flavor.

Mr. Saml. Pond, White Calville.

Mr. Manning, Pennock's Red Winter, a large winter fruit, equal to Baldwin; Yellow Bellflower, Winesap.

Pears. Mr. Pond, Echasserie or the Ambrette of Cox.

Mr. Manning, Easter Beurre, a new Flemish fruit of high celebrity and great promise, a most productive variety, keeps till May.

WILLIAM KENRICK.

GOAT NURSES.

IN this age of improvement we shall expect to see the farmer advertising a fine fresh goat or ewe, giving milk sufficient to suckle two children; or a fine gentle heifer that will allow four children to draw at once—suitable for a public nursery.—*N. Y. Farmer.*

"I believe the best method of rearing children, when their mothers cannot nurse them, is by allowing them to suck a domesticated animal. I know a fine healthy young lady, now about 17 years of age, who was thus reared. A goat is the best animal for this purpose, being easily domesticated, ever docile, and disposed to an attachment for its foster child: the animal lies down, and the child soon knows it well, and, when able, makes great efforts to creep away to it and suck. Abroad, the goat is much used for this purpose, the inhabitants of some villages take in children to nurse; the goats when called, trot away to the house; and each one goes to its child, and it sucks with eagerness, and the children thrive amazingly."—(*Gooch's Lectures.*)

From the New-York Farmer.

SHEEP HUSBANDRY.

—We have heard it remarked by some of the best farmers of Dutchess, will insure the gradual improvement in fertility of a farm. The following extract comes in corroboration of this opinion. It is from "*Reports of Select Farms*," No. IV., and has reference to a Gloucestershire hill farm:

"The improvement of the soil which he occupies, ought to be the object of every farmer.—Land, in a natural state, if dry, undergoes a gradual improvement from the yearly growth and decay of the vegetable substances which grow upon it. But if the vegetable substances which grow upon it are eaten off by sheep, which drop their dung in return, and in small portions at a place, the improvement goes on much more rapidly. Hence, land that is always pastured by sheep, is always improving, while that which is always mown is deteriorating. The number of sheep, therefore, kept on the farm, tend much to its gradual improvement; and the regular deposition of sheep's dung over so great a portion of the farm, every year, in consuming the turnip crop, is an excellent preparation for the course of cropping that is to follow. The double manuring which the land thus gets, in the same year, may be thought by some to be too much; but the land of this farm, and the whole district, is so thin and

brushy, that it can hardly be overdone with manure."

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 25, 1833.

ON MAKING BUTTER IN WINTER.

ALTHOUGH, as a general rule, it may not be the best of economy to attempt to make much butter in winter, yet when a farmer has good cows, good hay and roots, &c. and no market near for his milk, he may as well, perhaps better, make it into butter than apply it to any other use. But there is a difficulty in making butter in cold weather, which, to those who do not understand the philosophy of butter making is apt to cause the expense to exceed the profits, if not to cause a total failure in the attempt to obtain butter from cream or milk in the winter season.

Some degree of warmth is as necessary to make butter as it is to cause that fermentation in the juice of apples which changes it into cider, or causes it to work as the phrase is; and in process of time, under certain circumstances to change cider to vinegar. Butter is formed by slightly souring and stirring the cream from which it is churned. But this souring will not take place as long as the cream remains nearly at the freezing point. If you make your cream warm enough, and keep it warm long enough, that is till it begins to change, you may, if your cows are well fed make butter as well in cold as in warm weather. This may be done by keeping your dairy room warm by a stove or some other means, or by setting metal milk-pans in vessels of wood, and surrounding them with hot water, and renewing the hot water, if occasion may require till the milk or cream is slightly soured.

Arthur Young, in his notices of Epping dairies, where the best English butter is made, states that "the dairy maids are particularly attentive to one circumstance, that there must be a certain proportion of *sour* in the cream either natural or artificial or they cannot ensure a good churning of butter. Some keep a little of the old cream for that purpose; others use a little rennet; and some a little lemon juice.

A letter from R. Smith to J. H. Powel, published in Memoirs of the Penn. Agr. Society, contains the following passage:

"Since the month of January, my dairy people have been in the practice of always placing the pans containing the milk in water simmering hot. The oily parts which constitute the cream, are by such heat separated from the other ingredients; and then from their specific lightness, they of course ascend to the top in the form of cream. Cream is thus obtained during the coldest weather in winter in the course of about twelve hours after the milk has been taken from the cows. And the operation of churning such cream never exceeds twenty-five minutes. The milk pans remain in hot water about thirty minutes. The butter has invariably been of a fine flavor, and of a beautiful yellow color; and in the nature of things it never can be otherwise, unless the dairy woman should be utterly ignorant of the art of making sweet butter."

Another mode of making butter in winter has been practised by E. H. Derby, Esq. of Salem, Mass. and has been by him thus described:

"The milk, when taken from the cow is immediately strained into earthen pans, and set in the coldest part of the house; as soon as the frost

begins to operate a separation takes place; the cream rises in a thick paste to the top, and leaves the milk without a particle of cream frozen in the pan. The cream is not so hard but that it can be easily scraped off with a spoon, down to the solid ice; it is then set aside until a sufficient quantity is collected for a churning, when it is warmed just so much as to thaw the cream, and sufficiently to put into the churn: I have never known it require more than five minutes to convert cream into butter after the churning had commenced.

"All the butter that was consumed in my family the last winter has been made in this way, and I think I never had finer. I ought to state that I think this method injurious to the cream for certain purposes; such for instance as whip syllabub, as my domestics found after the cream was mixed with other ingredients, that the least agitation brought it to butter."*

Butter made from Scalded Cream. Another mode of making butter recommended in English publications is as follows:

"As soon as the milk is taken from the cow let it be placed on a steady wood fire, free as possible from smoke, and scalded for thirty minutes—particular care must be taken not to allow it to boil. It must then be placed in a cool situation, and on the following day a thick rich cream will appear on the surface of the milk (which is excellent for dessert purposes.) This may be taken off, and made into butter in the ordinary way." It is said that a greater quantity of butter, and of a better quality can be made by this than by the common modes.

Loudon has the following remarks on this subject:

"As winter butter is mostly pale or white, and at the same time of a poorer quality than that made during the summer months, the idea of excellence has been associated with the yellow color; hence various articles have been employed in order to impart this color; those most generally used, and certainly the most wholesome are the juice of the carrot, and of the flowers of the marigold, carefully expressed and strained through a linen cloth. A small quantity of the juice (and the requisite proportion is soon ascertained by experience) is diluted with a little cream, and this mixture is added to the rest of the cream, when put into the churn. So small a quantity of the coloring matter unites with the butter that it never imparts to it any particular taste."

THE BLACK TONGUE.

An experienced Farrier has communicated to the Canandaigua papers the following Recipe for the cure of this disease:

Take of Borax and Alum, an equal quantity, say 1 oz. of each to a creature, with half an oz. of copersas, pulverize them together; make a strong tea of sage (the above in it), and sweeten it with Honey. When cold swab the mouth every hour or two. After the disease is checked, oil the mouth and the cure is soon effected.—*Genesee Farmer.*

SLOBBERING HORSES.

A practical farmer in the Bucks Co. Intelligencer says, he has occasionally observed timothy, herd, and clover, produce this disease; during 20 years' observation on orchard grass, he has known only one instance of its producing this effect, and this from hay cut in November.—*N. Y. Farmer.*

* See N. E. Farmer, vol. iii. p. 253.

MISCELLANY.

SYMPATHY.

BY BISHOP HEBER.

A KNIGHT and a lady once met in a grove,
While each was in quest of a fugitive love;
A river ran mournfully murmuring by,
And they wept in its waters for sympathy.

"O never was knight such a sorrow that bore!"
"Oh never was maid so deserted before!"
"From life and its woes let us instantly fly,
And jump in together for company!"

They search'd for an eddy that suited the deed,
But here was a bramble and there was a weed;
"How tiresome it is," said the fair, with a sigh,
So they sat down to rest them in company.

They gazed on each other, the maid and the knight,
How fair was her form, and how goodly his height;
"One mournful embrace!" sobb'd the youth, "ere we die!"
So kissing and crying kept company.

"Oh, had I but loved such an angel as you!"
"Oh, had but my swain been a quarter as true!"
"To miss such perfection how blinded was I!"
Sure now they were excellent company.

At length spoke the lass, 'twixt a smile and a tear,
"The weather is cold for a watery bier,
When summer returns we may easily die,
Till then let us sorrow in company."

DELICATE WOMEN.

"A delicate woman," said Byron, as recorded in Lady Blessington's Conversations, "however prettily it may sound, harrows up my feelings, with a host of shadowy ills to come, of vapors, hysterics, nerves, megrims, intermitting fevers, and all the ills that wait upon poor weak woman, who when sickly, are generally weak in more senses than one.

The best dower a woman can bring, is health and good humor; the latter, whatever we may say of the triumphs of mind, depends on the former, as according to the old poem,

'Temper ever waits on health,
As luxury depends on wealth.'

But mind, when I object to delicate women, that is to say, to women of delicate health, *alias* sickly, I don't mean to say that I like coarse, fat ladies, *a la Rubens*, whose minds must be impenetrable from the mass of matter in which they are encased. No! I like an active and healthy mind, in an active and healthy person, each extending its beneficial influence over the other, and maintaining their equilibrium; the body illuminated by the light within, but that not let out by any chinks made by disease or time.

Buxom health, with rosy hue, gives me a better idea of female loveliness, than 'lanky languor, sickled o'er with the pale cast of thought;' that is, I think bad health, and bad humor are often synonymous, making tomorrow cheerless as to-day. Then see some of our fine ladies, whose nerves are more active than their brains, who talk sentiment, and ask you to administer 'to a mind diseased, and pluck from the memory a rooted sorrow,' when it is the body that is diseased, and the rooted sorrow is some chronic malady.

In short, I like as who does not? a handsome healthy woman, with an intelligent and intelligible mind, who can do something more than what it is said a French woman can only do *habille, babille, and dishabille*, who is obliged to have recourse to

dress, shopping and visits to get through a day, and soirees, operas, and flirting to pass an evening.

I am moderate in my desires; I only wish for perfection."

HINTS TO FAMILIES.

To comply with the prevailing fashion of the times; to receive, and attend large parties; to associate on terms of equality with those who are considered influential and genteel people, and whose circumstances can enable them to sustain such expense, doubtless has its advantages, especially where there are families of sons and daughters just coming on the theatre of life; but these advantages may be too dearly bought. Those families who spend their whole yearly income from year to year, for the sake of appearing with the more wealthy and fashionable, keeping nothing in reserve 'for a rainy day,' must under a change of circumstances, find abundant cause to regret such an unthrifty course. There is perhaps no way so sure to lay the foundation for future discontent and wretchedness of children as to educate them above their circumstances and condition in life, and especially daughters of families in moderate circumstances, giving them a little music, and just enough of what is denominated a fashionable education, to form in them a distaste for every sober employment, and render them discontented, useless and worthless through life. Those families in New England, who begin with little, and rise gradually, by industry and economy, to the first rank in society, are with few exceptions, the only happy families among us. If life were to be one continued, bright, sunny holiday, and nothing to be hoped or feared beyond it, that course of education, which by discarding common sense, disqualifies so many of our daughters for the ordinary duties and sober employments of life, would be less excusable. But storms as well as sunshine are to be expected and provided for. Affliction and adversity, at sometime, are the lot of all—and what is more, those chastisements are necessary, and are sent in mercy to reclaim us from our wanderings. Is it not wise therefore to teach our children to expect and be prepared for those scenes of life, which are most certainly before them?—*Northern Farmer.*

STEAM COACH.

Sir C. Dance's steamer, which makes its trips three times a day from Wellington street to Greenwich, continues to attract an immense crowd of curious spectators, both on its departure and its return; and such is the demand for places that the applicants exceed the power of accommodation, and many wait for two hours to gratify their desire for an excursion in this new mode of conveyance. The journey continues to be performed with safety and certainty, and all seem pleased with the ease and equable motion of the vehicle.

The passion for railway undertakings seems to be undiminished, and in some cases appears to overstep the bounds of sobriety. We see continually in the local papers announcements of fresh projects. Besides numerous additions which are contemplated to the railroads within the limits of Lancashire and the coal districts, where railroads may be said to have become naturalized, there are now plans in agitation which if they take effect, will intersect the country with the following, among other great lines of iron. The railway from Manchester and Liverpool to Birmingham, and from Birmingham

ham to London (actually commenced) a line from London to Brighton forming, with the line first mentioned, a line from Liverpool to the southern coast; a line from London to Bristol continued to Exeter, and we believe to Plymouth, thus cutting the whole south of England: a line from Milford Haven, in the western extremity of south Wales to London; a line cutting the western side of the island and from Falmouth to Liverpool, connected by a steam navigation across the Bristol Channel; a line from the east to the west coast of the island between Carlisle and Newcastle; another from sea to sea, farther south from Liverpool to Hull (or Selby.) Here is some work cut out for engineers.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Peonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17.

IMPROVED HEARING TRUMPET.

THIS Instrument possesses the valuable property of conducting Sound in an infinitely more distinct and agreeable manner, than any of the numerous contrivances which have been devised for the assistance of those who are afflicted with imperfection of the sense of hearing. From its flexibility it becomes as portable as the common Hearing Trumpets, and affords the additional advantage of rendering conversation as distinct between persons who are removed to the full extent of the Tube, as with those who are immediately near each other.—For sale by E. WIGHT, Druggist, 46 Milk st. opposite Federal st.

NO. 25.

HARRIS' PATENT PREMIUM
PAINT MILL.

For Sale at the Agricultural Warehouse,
No. 52, North Market Street, Boston.

J. R. NEWELL, AGENT.

PERSONS wishing to purchase, by examining this machine critically, and using it according to the directions accompanying each Mill, will find that it possesses many important advantages, over any other mill heretofore invented; among which are, that the grinding parts, or parts which necessarily get painted, can, in less than a *quarter of a minute*, be taken entirely from the frame and thrown into water, which, (this last improvement,) supersedes the necessity of cleaning, except for a change of colors. And also, this Mill is always kept in any order the user wishes, by *filing*, which is a very important advantage over any other mill heretofore invented.

Purchasers will please recollect that they are generally finished in order for *common painting*, and using will wear them fit for the finest work.

One of these machines has been exhibited at the late *Annual Fair of the American Institute*, of the city of New-York, and obtained the *First Premium* for its superiority in construction.—Certificates to the following effect were produced, (all from persons who have used other mills, and thrown them aside to give place for the kind here offered): That its durability and simplicity in its construction—the unparalleled quantity which it grinds to each revolution—the ease with which it is taken apart and cleaned for different colors, and the small quantity wasted in grinding fine colors; together with several other important advantages over any other mill which the undersigned has seen, entitle it to the approbation and encouragement of coming into general use, signed by Messrs. KELLY & CURRY, J. T. MOORE, jr. P. S. CARPENTER, D. O. MACOMBER, LUKE TORBOSS, and J. B. ELMENDORF, New-York; G. HALL, Brooklyn; PRESCOTT & PERRY, Troy; WARD & ROSS, Schenectady; EDGERTON & ANNABLE, Little Falls, and W. & G. F. WICKER, Utica. Another signed by WM. HANLEY and G. W. HARRIS, certifying that they have seen one of them grind 150 lb. of White Lead in 45 minutes. Another signed by E. TRASK, H. H. HOLMES, R. MONTGOMERY, certifying that they have seen one of them grind 50 lb. of white lead, by hand, in 15 minutes, the diameter of which is no more than $7\frac{1}{2}$ inches.

The Subscriber will now warrant his mills to grind as above asserted, on special contracts. Many other certificates, from an equally respectable source, might be presented, but these are deemed abundant for this place.

These mills are as well calculated for *water* as *oil colors*.—PRICE single, \$18. A liberal discount made to purchasers by the dozen. Purchasers will please leave their name and place of residence with those of whom they purchase.

☞ All communications addressed to the Agent, will be punctually attended to.

CHINESE MULBERRY.

If the following article is correct, and we know nothing to the contrary, it is highly important that those who are concerned or feel an interest in the American manufacture of silk should be apprised of the facts it contains. It is, likewise, an important question whether the *Morus Multicaulis* will endure the severity of the winter in the northern States.

In an article, written by Judge Buel, and published in the *New England Farmer*, Nov. 2, 1831, vol. x, p. 121, it is stated as follows:

"We had two plants of the Chinese mulberry in our nursery last season, one budded, the other on its natural roots. They both grew vigorously, and both were killed by the severity of the winter, root and branch. I mention this fact as suggesting a doubt, whether this desirable plant will endure our winters. I would like to learn how it has fared in your neighborhood, during the last winter."

We hope some gentleman acquainted with the subject will give us the information sought for.—ED. N. E. FARMER.

From the American Farmer.

MORUS MULTICAULIS, (New Chinese Mulberry).
—This variety of mulberry continues to attract the attention of foreign silk cultivators, and must soon exclude all other varieties from use. As we are gradually becoming a silk producing people, it is of the utmost importance that our mulberry orchards should be commenced with the best varieties, because it will cost no more to plant an orchard with the best, than it will to set out the very worst. But it is quite another thing, after all the expense of money and time has been incurred in planting the white mulberry, to be obliged to dig them all up and replace them with the one which shall then be found indispensable to profit. That this will be the case with all who are now planting any of the old varieties, we have no doubt; for the *Morus Multicaulis* is so much better adapted to the feeding of silkworms, and those who possess it will be able to make silk so much cheaper than those who use any other kind, that they will be able to monopolize the market—or at least compel those who use the latter to sell silk at a loss and thereby compel them to adopt the new kind or quit the business. Our readers may be assured of the sincerity of these remarks, and we entreat them not only for their own sakes, but for the sake of the cause of American silk culture itself, to give them due attention. Europe, with its cheap labor and the assistance of this new variety of mulberry, will be able to undersell us, and thereby contend successfully with our more favored climate and more intelligent and skilful people. To enable us therefore, to meet her in the market upon, at least, equal terms, we must avail of all the means in our power; and at this time the *Morus Multicaulis* is the most important, and should not be neglected. In the end, it is the cheapest variety for an orchard, because its extreme facility of propagation renders it capable of being multiplied ten-fold at least every year. Its rapid growth is another high recommendation. The writer of this has gathered ripe fruit from a tree only *thirteen months old*, and has at this time a tree growing from seed ripened

at that time. Any person may make an orchard as large as he can desire in three years, by planting 20 or 30 trees, and laying them or planting cuttings from them. The leaves contain a much larger quantity of nutritive matter than those of the white, or any other variety, and consequently one pound of them will produce a much larger quantity of silk. The leaves are also so large that one half, at least, of the expense of gathering is saved—one leaf of *morus multicaulis*, being equal to at least a dozen of the white variety. We have thought it our duty to call public attention to this subject once more, as it is all important in all new beginnings, with individuals or nations, to take such a start as not to be obliged to turn back and begin again.

PERSIAN MANAGEMENT OF SILKWORMS.

The Asiatic method of managing silk-worms, is preferable to that formerly practised on the Aktourba, where much time and expense were wasted in feeding the silk-worms with gathered leaves, which soon decayed, and rendered the frequent shifting of their beds necessary. The Persian or Boukharian rears his mulberry trees, to about six feet high, which they attain in four or five years, he then begins to lop their tops and branches, which are given to the insects, as soon as they have sufficient strength, by placing them gently on their beds. By this means the shoots remain fresh and succulent, and the worms devour them even to their woody fibres, so that no part of the nutritive foliage is wasted. As these insects are every day supplied with food, the leafy branches gradually form a kind of wicker work, through which the impurities pass, so that the cheerful worms preserve the requisite cleanliness without trouble to the cultivator, and speedily obtain a vigorous state. In this manner they are continually supplied with leaves, till they prepare to spin, when small dry brush-wood is placed in all directions over the leafless branches; on this the worms spin their silk. Two persons, an adult, who lops the branches, and a child who collects them, are thus enabled quickly to procure food for a great number of silk-worms.

The mulberry tree, in our climate produces new shoots twice in every summer. These shoots acquire in the same year the firm consistence of wood. In Persia and Boukharia, where the summer is longer and the vegetation more vigorous, the shoots may be even cut twice a year. The tree by this method of cutting, always remains low, and produces a great number of young shoots from its trunk as well as from its branches, every subsequent year.

By stripping them of their leaves, however (on the contrary), many branches wither and not only the buds are lost, and much foliage wasted, but the worms receive less nourishment, as the leaves sooner decay. It has been remarked, in the silk establishment near Aktourba, that the worm, when compelled by necessity, eats leaves of the *Acer tartaricum*, which resemble those of the mulberry tree.

THE WEEVIL.

SALT is said to be a complete preventive against the destruction of wheat by the weevil. Mix a pint of salt with a barrel of wheat, put the grain in old salt barrels, and the weevil will not attack it. In stacking wheat, four or five quarts of salt to every hundred sheaves, sprinkled among them, will entirely secure them from the depredations of the insect, and render the straw more valuable as food for cattle.—*Hort. Register.*

ACCOUNT OF COMMON SALT.

It does now appear that the mineral kingdom contains a single species capable of being employed as food; but there is one mineral species which indirectly contributes to the nourishment of many other animals as well as man, and that is common salt, the flavor of which, to a certain extent, is not only grateful to the palate, but, practically speaking, mankind could not exist, or at least never have existed without the constant use of it. Thus, though employed in very small quantities at a time by any individual, and almost exclusively for the purpose either of preserving or of rendering his food more palatable, this substance may fairly be classed among the principal necessities of life; and correspondently with this statement, we find that nature has supplied it in abundance, indeed, in profusion often, in various parts of the globe: for, to say nothing of those apparently inexhaustible masses which occur among the solid strata of the earth, and which have been constantly quarried through successive ages from the earliest records of history, the ocean itself is a never-failing source of this valuable substance. In other instances salt springs afford the means of a ready supply; and throughout a considerable part of the sandy districts of Africa and Asia the soil itself abounds with it. The abundant supply of common salt coincides with its extensive utility. It is every where indispensable to the comforts of man; and it is every where found, or easily obtained by him. And, though not to the same extent, the same observation holds with reference to many other natural saline compounds. Thus carbonate of potash, and natron or carbonate of soda, alum, borax, sal ammoniac, and sulphate of iron, or green Vitriol, which are most extensively useful salts in many processes of the arts, are either found abundantly in various parts of the world, or may be obtained by very easy means: while a thousand other saline compounds, which are rarely of any practical importance, are scarcely known to exist in a native state.—*Kidd's Bridgewater Treatise.*

MILCH COWS.

We are frequently asked what breed of cattle we think best for the dairy; and as we have taken no inconsiderable pains to inform ourselves on this subject, both by actual observation and obtaining the opinions of a great number of practical men, we think proper to answer the question in this way: Were we about commencing a dairy, our choice would be, without hesitation, half blood Durham Shorthorns. We should be particular in selecting those by a first rate Durham Shorthorn bull, out of some of our best common cows, and if we could procure them from the hornless or buffalo breed, so much the better. Half blood shorthorns are almost always good milkers, and first rate butter makers, averaging, in good pasture, eight to ten pounds of butter per week. We have to support us in this opinion, the testimony of several practical and intelligent persons, who have had both full blood and half blood cows: and among these persons is a lady in Pennsylvania, whose husband owns some of the finest Durham Shorthorn stock in America. This lady superintends her cows herself, and has witnessed the milking of the full and half blood for many years; she has kept their milk and cream separate, and ascertained the quantities of milk and butter yielded by both; and has thus been able to decide with scarcely the possibility of error. Her trial of both

breeds has not been confined to one or two select animals, she generally has half a dozen of each and as her husband deals largely in this kind of stock, her cows are continually changing. She also has Devon cows, and half blood cows of the same; but her preference for the dairy is as stated above, decidedly in favor of half blood Durhams. It is true her cows run in good pasture, without which no breed can be good milkers. Where the pasture is short without doubt, the North Devons are the best, because they do keep in good condition in pastures that Durhams would fail in.

But a word to those who wish to obtain deep milkers. Whoever would have a large quantity of milk, and that of good quality, must provide good pasture and good water. You might as well expect a good crop of corn from a sand hill, without manure and rain, as a large quantity of milk from a cow in poor pasture with bad water. And, let us remark, good water is as essential to good milk yielding as good pasture. We had a cow last summer that yielded five gallons of rich milk a day. She ran in a tolerable pasture, but there was a stream of pure spring water running through it. We also kept salt constantly within her reach. The same cow this summer in a much better pasture, does not yield three gallons of milk. The reason of this falling off is, that she is supplied with water from a pump, occasionally, when her attendant conceives she wants it—not when she thinks she wants it, which is the great point. She also gets salt “as it happens.”

We have often heard of cows giving large quantities of milk, that “eat scarcely any thing” to which we always reply, “tell that to the marines, for old sailors won't believe you.” A cow cannot make milk out of nothing; and she can only give you milk in proportion to the quantity of good food you give her.

In giving our opinion of the best milkers, we know we render ourselves obnoxious to the criticism of those who own other breeds. There are three or four parties to this question, which may be named after the breeds of animals they prefer. They are full blood Durham Shorthorns, half blood Durham Shorthorns, North Devons, Alderneys, &c. The party to which we belong is indicated as above.—*Amer. Farmer.*

RURAL ECONOMY.

From the letter of one of our esteemed correspondents near Philadelphia we make the following extracts:

BREMEN GEESSE.—One of my neighbors, who is very curious about his poultry, has Bremen geese. He procured them last spring, when they were only a few weeks old; and early in the fall one of them weighed 16 lbs. without fattening. They would probably weigh twenty pounds each at this time. They are snow white, and most beautiful creatures. I hope soon to obtain some of the young brood.

OLD PEAR TREES.—One of the Bell Pear Trees at the back of our house is nearly one hundred and twenty years old. The other is a sucker from it, and both continue to bear abundantly.

ORCHARD GRASS.—Some of our farmers who have a rich soil, cultivate the Orchard Grass with profit. It would be more grown if its successful culture did not interfere with the usual rotation of crops in this district. It may be sown with clover and timothy: it will then come to its best after

these grasses have declined. A better plan, however, is to allot a field or two for its exclusive culture, where it must remain unploughed for many years.

THORN HEDGES.—The Potomac thorn is used for hedges in these parts on account of its rapid growth and quick maturity. The pear-leaved or Newcastle thorn is likely to be more durable, but requires more time to form an efficient hedge.

Genesee Farmer.

MORTALITY AMONG FISH.

SEVERAL cases of great mortality among fish have lately come to our knowledge. We record, and publish them for the benefit of men of science, and for the gratification of the curious.

In July last the fish in the south pond at Southwick died in great numbers. The pond is about three miles in circumference, and the dead fish that floated to the shore in one week, it is believed, would amount to twelve tons. They averaged about a dozen fish to the rod. The Hampden canal passes through the pond. The water abounded in dead fish, which were drawn off by the waste gates of the canal. There was no change in the appearance or taste of the water, and there was no apparent cause for their dying then, in greater numbers, than at other times. The mortality was principally among the pickerel and perch; scarcely a bull-head, with which the waters abound died. Some of the inhabitants in the vicinity attributed it to a severe thunder storm, but generally it was supposed to be owing to the prevalence of disease among them.

A similar mortality occurred among the fish in the north pond in 1803. It is separated from the south by a strip of land wide enough for a road. No cause of this mortality is known. The dysentery prevailed in Southwick and the adjacent towns during that summer and great numbers died. Some thought that the mortality among men and fish proceeded from the same cause.

A similar mortality occurred among the fish in the pond half a mile west of the meeting house in West Brookfield about the year 1812. Previous to the death of the fish the water changed its color, appearing as if containing clay in a state of partial solution. The pond abounds in bog iron ore; it is raked up from the bottom as oysters are from the bottom of the ocean. It was at the time a prevalent opinion that a bed of copperas or sulphate of iron was suddenly uncovered in the bottom of the pond and was dissolved in its waters. The fish floated to the shore dead.—*Westfield Register.*

GYPSUM, PLASTER OF PARIS.

THERE is a great difference of opinion, among farmers, with regard to the effect of gypsum, upon vegetation when used as manure, both in regard to the manner in which it acts upon vegetables, and its lasting beneficial effects when applied to soils.

The more common opinion has been that Gypsum attracted moisture from the atmosphere, and therefore was only useful upon dry soils, and mostly so in dry seasons.

Others have believed, that by the application of Gypsum the fertility of land was increased for a few years only, and that after a few forced crops which might be produced by its application the lands thus stimulated were left in a state of barrenness from which it was nearly impossible to recover them.

A little attention to the history of Gypsum, as to its component parts, and its properties, will correct any such prejudices as the above, and convince farmers that in much of our country, that it is not only the best, but the cheapest manure that can be applied to our soils, especially where the cultivation of wheat forms an important item in the rotation of crops.

Gypsum, Plaster of Paris, or Sulphate of lime, is composed of sulphuric acid, or oil of vitriol and lime, forming a neutral salt, which in addition to the above, as it is commonly found contains a portion of water, in a solid form, which is called the water of crystallization. It contains nearly equal parts of the above, or according to *Chaptal*, one hundred parts contain 30 parts of sulphuric acid, 32 of lime, and 38 of water.

Sir H. Davy gave the following proportions, 75 parts of sulphuric acid, 34 of water, and 55 of lime.

When speaking in common of Gypsum we say it is insoluble in water; yet this is not strictly the case, as it dissolves in about 500 times its weight of water.

Dr. Black observes, "although this compound is difficult to dissolve, and requires much water to its solution, it can however be completely dissolved, when water enough is applied to it, viz. one ounce for each grain."

Sir H. Davy says "Gypsum is soluble in about 500 times its weight of cold water and is more soluble in hot water; so that when water has been boiled in contact with Gypsum, crystals of this substance are deposited as the water cools," hence it appears that the affinity of Gypsum for water is not very strong although it is capable of being dissolved in it.

That Gypsum is taken into many plants when growing, particularly the clover family, has been sufficiently proved by analysis; but the quantity thus taken into circulation, which probably enters the plant, by the roots, in solution is very small, and yet it appears to be absolutely necessary for their perfection. By experiment Sir H. Davy found that the quantity of Gypsum contained in one acre of clover would not amount to over three or four bushels.

Most of our good wheat lands in Western New York contain more or less Gypsum, some perhaps have as much as is beneficial to plants to be cultivated, and on such soils it will be found that the application of more will not increase its fertility, but upon others it will not only be found the best, but the cheapest manure that can be applied.

Lands that have much surface water upon them, are not suitable for receiving Gypsum, as a manure, for the reasons above given, viz. that it is dissolved in 500 times its weight of water, and would of course soon be carried off in solution.

If the theory is correct as we believe it to be, that the manner in which Gypsum acts upon plants, is by first being dissolved, and after entering the plant by the roots, then it becomes important to know at what time of the year it should be put upon soils, in order to derive the greatest benefit from the application, and it may also become important to inquire whether it should be ground to an impalpable powder, or to apply it in coarser particles.

It is well known that by reducing the particles, the quantity of surface is increased and also that the solution of different substances depends, as to time, upon the quantity of surface presented to the

solvent; hence the finer the Gypsum the sooner it would be dissolved.

If Gypsum is to be dissolved by the first sufficient quantity of water with which it comes in contact, then it would appear that fall is not the proper season for applying it, and that even when applied in the spring it should be omitted until after the snow water and heavy spring rains have passed from the surface.

On the other hand as water is necessary for its solution, it will be of little use to summer crops unless applied before the spring rains have altogether ceased.

The quantity to be applied should be regulated by circumstance. When the soil is a dry loose sand, four bushels per acre will be required and advantageously applied, but where soils are more retentive, or are found to contain this salt by nature, a smaller quantity will answer, as in such soils by deep ploughing that which has been dissolved upon the surface and has sunk into the soil, may by the process be brought again to the surface and prepared to be taken up by the roots of plants.—*Goodsell's Farmer.*

MASS. HORTICULTURAL SOCIETY.

PREMIUMS ON FRUITS.

At a meeting of the Fruit Committee of the Massachusetts Horticultural Society, Dec. 7, 1833, the following premiums were awarded.

Apples. To John Mackay of Weston, for the Hawthornden apple, a premium of \$4

Pears. To Robert Manning of Salem, for the Julienne pear (of Cox), a premium of \$4

To E. Vose of Dorchester, for the Capiaumont pear, a premium of 4

To Micah H. Ruggles of Troy, (Fall River), for a native pear called the "Wilbur," premium 4

Peaches. To Cornelius Cowing of Roxbury, for the best peaches, a premium of \$4

Nectarines. To Thomas Mason of Charlestown, for the Elruge Nectarine, a premium of \$4

Strawberries. To P. B. Hovey, jr. of Cambridgeport, for the "Methven Castle," a premium of \$2

Apricots. To Samuel Pond of Cambridgeport, for the best apricots, a premium of \$4

Plums. To Samuel Pond of Cambridgeport, for "Pond's Seedling Plum," a premium of \$5

Gooseberries. To Samuel Walker of Roxbury, for several varieties, a premium of \$2

Green-house Grapes. To Jacob Tidd of Roxbury, for the "Nice" grape, a premium of \$5

To Joseph Balch of Roxbury, for the largest girdled grapes, Black Hamburg, a premium of 5

To Doct. S. A. Shurtleff, for the best Seedling grapes, Shurtleff's Seedling, a premium of 5

Cherries. To E. Vose of Dorchester, for the Black Tartarian Cherry, a premium of \$4

Raspberries. To Messrs. A. & J. Winship for the Barnet Raspberry, a premium of \$2

The Committee noticed with approbation the beautiful specimen of Bolmar Washington Plums exhibited by Mr. Edward Cruft, a variety than which no other is more worthy of extensive culture, as also the native apricot by the same gentleman; and a fine specimen of native nectarines presented by Mr. Blake; the native peaches by Mr. Weld, seedling grapes by Mr. Pond, and several varieties of currants recently imported by Messrs. Winship;—these are all valuable fruits, and are recommended as highly worthy of general cultivation.

Per order, ROBERT MANNING.

From the Oxford, (N. C.) Examiner.
"FARMERS' ARITHMETIC."

Profits of Agriculture.—If the great Franklin had ever lived in the country, his observing eye would have noticed, and his discriminating judgment have solved, the following difficult problems:

1. Farmers are more imposed upon than any other class of the community; they pay nearly the whole expense of the State Government, are sometimes oppressed by onerous measures of the General Government, and by the commercial regulations of foreign nations; never having much money, yet every industrious, prudent farmer grows rich!

2. The mechanic receives his 75 cents or a dollar a day, yet remains poor; the farmer earns his seventeen cents a day, and grows rich!

3. Merchants, Physicians, Lawyers, and others, receive their thousands per annum, and die poor, while the farmer scarcely receives as many tens, yet dies rich!

How are these strange results produced? All calculations in dollars and cents fail to account for it. Those who are determined to bring every thing to the standard of dollars and cents, pronounce agriculture to be wholly unprofitable, when the fact that nearly all the wealth of the country has been obtained by agriculture stares them in the face. In the opinion of calculators, agriculture is the proper pursuit of such only, as have not sense enough to pursue any thing else.

The mischief which such calculations are doing in our country, first induced me to call the public attention to the *Farmers' Arithmetic*. But having been more accustomed to handling the plough than the pen, I am altogether unable to do justice to the subject. If some abler hand would take it up, dispel the mist now resting on the subject, and show us clearly the whole truth of the matter, it would be sufficiently good to compensate the labor of the ablest patriot.

When the mechanic lays down his tools and the professional man is idle, they are sinking, because their expenses are going on and their profits are suspended. Not so the farmer; while he sleeps, his crop grows and his stock continues to increase, and when he spends a social evening with his neighbor, every thing continues to advance. The *Farmers' Arithmetic* shows that the farmer grows rich by saving, while others continue poor by spending. Others have first to make money and then give it for meat, drink, and raiment, while the farmer obtains all these at home. If he wants a lamb or pig, he has it without losing a day or two in trying to buy one. If he wants a new coat, the industry of his wife supplies it. In short, he wants but few, very few things which he cannot obtain on his own farm. Why, then, should the farmer repine because he has not the money to buy abroad? or measure his wealth by comparing his money with that of others, who must give it all for things which he has without buying! Surely a farmer may, without a sigh, resign to others the gaudy fabrics of foreign artists, while he is clothed by the labor of the hand that soothes his cares and strews with pleasure his journey through life. When I see a farmer appear in company genteelly dressed in homespun, I think of Solomon's description of a good wife—'her husband is known in the gates when he sitteth among the elders,' and most cordially do I congratulate the possessors of such a prize,

JACK PLANTER.

From the Journal of Health.
PLEASURES OF AGRICULTURE.

The employments of agriculture, independently of their profit, are most congenial and pleasing to human nature. An uncorrupted or untarnished mind sees in the progress of vegetation, and in the habits, and dispositions, and uses of those animals which man has subjugated to his sway, charms and beauties which the objects of art can seldom afford. The occupations of husbandry are most favorable too, to health, to plenty, to repose and to innocence. Can the pursuits of low and vicious gratifications, can luxurious indulgences, can the restless cares, the fears and anxieties of the ambitious, be compared with the labors and enjoyments of him whose days are spent in superintending the culture of his fields, his nights in quiet and refreshing sleep? Such a life is not inconsistent with a highly cultivated mind. It is by no means necessary that they who engage in rural labors should contract a coarseness of manners, or vulgarity of sentiment.

The superintendence of a garden is another source of simple and innocent pleasure. Nothing is better calculated to gratify the inherent passions of novelty, for nature is always renewing the varied appearance. She is infinite in her production, and the life of man may come to a close before he has seen half the beauties which she is able to display.

Short excursions into the country are, of themselves, the source of every sensible and innocent pleasure. But he who is engrossed by vice, or by business, will live half a life without admiring the beauties of a blue sky, basking in the vernal sunshine, or inhaling, with any consciousness of real delight, the balsam of a western gale.

In a proper intercourse, and behavior among our fellow creatures will be found, however, to consist our principal and most constant delight. To do good and to prevent evil, as far as the sphere of our influence or activity extends, is an infallible method of inspiring in ourselves pleasurable emotions.

MULES.

As the season has arrived when farmers have more time to enter into calculations as to the profit attending their raising different kinds of crops and breeds of cattle, sheep, horses, &c. we would recommend to them, an inquiry respecting the comparative profits attending the raising of horses and mules.

Where a farmer is acquainted with the different breeds of horses, and has procured breeding mares of such blood, as to ensure valuable colts, this may prove a profitable business, but where inferior mares are upon a farm, we are inclined to think that the rearing of mules would be attended with more profit than that of colts, for the following reasons:

First. The expense of breeding and rearing them is much less, as they may be kept upon a coarser kind of fodder than colts.

Secondly. They are saleable, at an earlier age than colts, and always command cash for a southern market.

Thirdly. They are not as liable to disease as horses, they live much longer, and are capable of enduring more hardships. They do not require as much cost of time in breaking before they are saleable, and purchasers are not as particular as to shape, as they are when purchasing horses.

There will at least be no disadvantage in examining the subject, and should they be found as profitable as horses, those who have lands but partially subdued, will find them extremely well calculated for the destruction of briars, and many coarse kinds of grasses, which would remain untouched by colts.—*Goodsell's Farmer.*

A VALUABLE JACK.

We recently copied from a western paper, an account of a sale of 160 mules by Gen. Shelby, of Kentucky, for \$11,840 cash. The country west of the Alleghenies is doubtless very favorable for the breeding of these animals, the real value of which for farm labor seems to be little understood in Maryland. We have had for several years near Baltimore a Jack, which for size, vigor, and all other requisites for a first rate breeder, is unrivalled by any other animal of the kind in America, so far as we have been informed. His height is but one quarter of an inch less than 15 hands, and every way well proportioned. Yet this splendid animal, has been suffered to pass season after season almost without use by our farmers. But this waste of valuable capabilities is now at an end—the animal has been seen by one who knows his value, and how to profit by it. He has just been purchased from Lloyd N. Rogers, Esq. by the Hon. Henry Clay, and taken to Kentucky. We understand that he was sold for \$1000, which was certainly not high, considering his great superiority over any Jack ever seen in the country.

—*Am. Farmer.*

HEAT PRODUCED BY FRICTION.

We stated a few weeks since, that a machine had been invented in this State to warm factories and all large public edifices by *Friction*. We had but little definite knowledge then of its merits or structure, but within a few days we have seen it in operation in this town. We now speak from personal observation. The machinery which generates the heat consists of a pair of horizontal circular plates of cast iron, enclosed in a brick oven, about four feet in diameter, and weighing 1600 pounds. They operate upon each other precisely like a pair of mill-stones, with this exception, the upper one is stationary and the lower one revolves. The ordinary speed is eighty revolutions a minute, and the velocity is sufficient in two hours to raise the thermometer in the oven in which they are enclosed to 500°. The size of the plates, their thickness and the velocity with which they revolve, are considerations which the size of the building to be heated must regulate. From the top of the brick enclosure or oven, a funnel is projected, and from this the heat can be thrown off, as through ordinary furnaces, to any part of the building. We saw the machinery put in operation when cold, and in fifteen minutes the heat from the mouth of the funnel in an upper story was almost too much for the naked hand to bear. There is yet much scepticism as to its final success, but we can see no reason for it ourselves. It has been thought the iron plates will soon wear out; but it is ascertained by experiments, that these smooth, hard surfaces will subtract from each other but very little. The machine is exceedingly simple in itself, can be put and kept in operation by a hand passed round a shaft inserted in the lower cylinder, and without danger or attendance, kept in operation day and night, with the aid of a water-wheel.—*Northampton Courier.*

POPULAR ERRORS IN MEDICINE. BY AN EDINBURGH PHYSICIAN.

A VERY common practice in eating such fruit as cherries is to swallow the stones, with the vague notion that these promote digestion. No error can be more fatally absurd. Many cases have occurred where such practices have been the cause of death, and that of a most excruciating nature. One instance is on record of a lady who died in great agony after years of suffering, and the cause was found to be several large balls found in the intestines, accumulated around clusters of cherry-stones. The husks of gooseberries are often swallowed with the idea that they prevent any bad effects from the fruit. On the contrary, they are the most indigestible substance that can be swallowed, and pass the stomach without any change, although they cause excessive irritation, and not unfrequently inflammation in the bowels.

Many people put great faith in the wholesomeness of eating only of one dish at dinner. They suppose that the mixture of substances prevents easy digestion.—They would not eat fish and flesh, fowl and beef, animal food and vegetables. This seems a plausible notion, but daily practice shows its utter absurdity. What dinner sits easier on the stomach than a slice of roast or boiled mutton, and carrots or turnips, and the indispensable potato? What man ever felt the worse of a cut of cod or turbot followed by a beef-steak, or a slice of roast beef and pudding? In short, a variety of wholesome food does not seem incompatible at meals, *if one do not eat too much*—here the error lies.

It is a common practice with bathers, after having walked on a hot day to the seaside, to sit on the cold damp rocks till they cool before going into the water. This is quite erroneous. Never go into the water if over-fatigued, and after profuse and long-continued perspiration; but always prefer plunging in while warm, strong and vigorous, and even with the first drops of perspiration on your brow. There is no fear of sudden transitions from heat to cold being fatal. Many nations run from the hot bath, and plunge naked into the snow. What is to be feared is sudden cold after exhaustion of the body, and while the animal powers are not sufficient to produce a reaction or recovery of the animal heat.

There is a favorite fancy of rendering infants and farther advanced children hardy and strong, by plunging them into cold water. This will certainly not prevent strong infants from growing stronger, but it will and often does kill three children out of every five. Infants always thrive best with moderate warmth and a milk-warm bath.—The same rule applies to the clothing of infants and children. No child should have so slight clothing as to make it feel the effects of cold—warm materials, loose and wide made clothing, and exercise, are all indispensable for the health of little ones. But, above all things, their head should be kept cool, and generally uncovered.

Many people so laud early rising as would lead one to suppose that sleep was one of those lazy, sluggish, and bad practices, that the sooner the custom was abolished the better. Sleep is as necessary to man as food, and as some do with one third of the food that others absolutely require, so five hours' sleep is amply sufficient for one, while another requires seven or eight hours. Some men cannot by any possibility sleep more than four or five hours in the twenty-four; and, therefore, true

to the inherent selfishness of human nature, they abuse all who sleep longer. No man should be taunted for sleeping eight hours if he can.

Many people do not eat salt with their food, and the fair sex have a notion that this substance darkens the complexion. Salt seems essential for the health of every human being, more especially in moist climates such as ours. Without salt, the body becomes infected with intestinal worms.—The case of a lady is mentioned in a medical journal, who had a natural antipathy to salt, and never used it with her food; the consequence was, she became dreadfully infected with these animals. A punishment once existed in Holland, by which criminals were denied the use of salt; the same consequence followed with these wretched beings. We rather think a prejudice exists with some of giving little or no salt to children. No practice can be more cruel or absurd.

AIR HOLES.

"Imperial Cæsar, dead, and turned to clay,
May stop a hole, to keep the wind away."

It is not uncommon to hear windows rattling in their frames, when two wedges in each, cut with a pen-knife, will do the service that the rhymes anticipate from great Cæsar's body. It makes no difference to comfort and very little to good taste, whether a room has one orifice as large as may be made by the passage of a twenty-four pound ball, or fifty unsoldered chinks, that admit an equal current of cold air. A good fire may warm a tight room; but the outward air cannot be warmed by flames less than those of Moscow.

"List, list, O list!"—list your doors, and caulk your floors and windows, all ye who complain of winter, because it is cold, or fuel, because it is dear. Carry a taper around your walls, and wherever its flame is waned by a breath of wind, put in a little cotton. It will be good both for you and the poor cotton planter. Let not the wind whistle through your key holes; it is dismal music—and for our nerves it has too many *shakes*.—*Boston Courier*.

From the Genesee Farmer.

GRAND ISLAND.

THE reader who has been so often pleased and instructed by our highly valued correspondent, *Ulmus*, (Lewis F. Allen, Esq.) may remember that, in reply to a call to write under his own proper signature, from Dan Bradley, Esq. which he declined on the ground that he was not a practical farmer, he said, that he "hoped one day to have a fine farm, well stocked with good horses, oxen, and sheep, and a good yard of poultry." We are happy to learn from the following notice in the *Buffalo Journal*, that he is in a fair way to have his wishes gratified; and we hope that we shall continue to receive the productions of his gifted pen, and the results of his experience as a practical farmer:

GRAND ISLAND.—This large and fertile island, in the Niagara River, containing nearly 18,000 acres, has, we understand, been nearly all purchased by our fellow-citizen, L. F. Allen, Esq. in connexion with the Hon. Stephen White, and some other wealthy capitalists of Boston. We learn that it is their intention to cut up for exportation the extensive forests of White Oak Ship Timber that abound upon it; and for that purpose they have already in employ about 100 men and teams, eating houses, a store, workshops, &c. A large

steam saw mill, with an engine of 80 horse power, and calculated to drive fourteen sets of saws, and a pair of mill-stones is about to be erected, which is intended to go into operation early in the spring. The engine was manufactured at the extensive establishment of Gibson, Grayson & Co. of Black Rock. The village which they are building up is on the eastern shore, nearly opposite Tonawanda; and the easy access from it to the Erie Canal, and the facilities of approach from Buffalo, by water at the distance of 8 miles, give it facilities enjoyed by but few places, in our neighborhood, and must soon render it an important acquisition to the business of our thriving city.

This valuable property has lain dormant and almost forgotten, since the renowned Jewish city of Ararat was founded by Judge Noah, on the very site of which the present proprietors are erecting their establishment. Aside from the timber on the island, the soil is said to be of the first quality for agriculture: and as it is the intention of the proprietors to clear the land and improve it, as the timber is cut away, it will shortly add its teeming fields and abundant harvest to our view.

Yet this is but another result, derived from the formation of the grand artery through our great state, and diffusing wealth and happiness to millions. But for the Erie canal, our magnificent forests would be considered a worthless load upon the earth that bore them; but now they are valuable objects of export to the Atlantic states, and annually add a vast increase to the wealth of the western country. Most heartily do we welcome the approaches of our Boston brethren, into this region, and hope that an enterprise so valuable to ourselves, may be most advantageous to them.

GRAPES.

THE West Chester, Penn. Register says that a vine is growing in the garden of Mr. Darlington of West Town, which bore grapes the present year, of which one measured $3\frac{1}{2}$ inches in circumference, and weighed 122 grains (about 47 grapes to the pound.) He has another vine that was transplanted in the spring of 1827, from which were gathered 3057 branches, many of which were from 9 to 11 inches long, with a branch from the upper part of the bunch, nearly half as large as the main bunch. The last mentioned is a native or chicken grape.

ON SALTING PORK.

As the season for salting pork has arrived, we would recommend it to those who wish a fine article next summer, to salt theirs without any bone in it. This requires but little extra labor, which is abundantly compensated for in the superior quality of the article. The bones may all be taken out with but little flesh upon them and that when cooked fresh makes some of our best dishes. Who is there that is not fond of a fine spare rib when roasted? and yet that very part, when salted, would be but indifferent. The action of salt upon the bones has a tendency to give to pork, when salted with them a different flavor from that in which they were all extracted. Be very careful not to put pieces in the barrel that have blood upon them. Use plenty of salt; that which remains undissolved will do for another year. Saltpetre is rather injurious to pork than otherwise, and should never be used by those that wish it in the greatest perfection.—*Genesee Farmer*.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JAN. 1, 1833.

FARMER'S WORK.

On the feeding and management of Milch Cows. It is of great consequence in the management of a dairy that the cows should be treated with gentleness, so that they may not be afraid of being milked, nor dislike the milker. A cow will not yield her milk willingly to a person she fears, bates, or apprehends ill treatment from. Young cows, in particular, may have their characters for gentleness, and good milkers formed by the manner in which they are treated. This truth, of much importance to all concerned in a dairy or its products, is well established and illustrated by a communication from Mr. Russel Woodward, published in *Memoirs of the New-York Board of Agriculture*, in substance as follows:

Having formerly kept a large number of cows, I observed many amongst them that dried up their milk so early in the fall, that they were not profitable, while others with the same keeping, gave milk in plenty, until late in the season. I likewise have often heard my neighbors observe, that some of their cows, though very good in the forepart of the season, dried up their milk so early that they were unprofitable, and they should have to put them off; I accordingly found it expedient to find out the cause if possible: and when I brought to mind the ways that some of my young cows had been kept and milked, I attributed the cause to the milking of them the first season they gave milk; and by many experiments since, I have found that young cows, the first year they give milk, may be made, with careful milking and good keeping, to give milk almost any length of time required, say from the first of May to the first of February following, and will give milk late always after, with careful milking. But if they are left to dry up of their milk early in the fall, they will be sure to dry up of their milk each succeeding year, if they have a calf near the same season of the year; and nothing but extraordinary keeping will prevent it, and that but a short time. I have had them dried up of their milk in August, and could not by any means make them give milk much past that time in any succeeding year. I had two heifers, which had calves in April, and after getting them gentle, I set a boy to milk them for the season, (which is often done the first season on account of their having small teats:) he was careless, and dried them both up in August. Although I was satisfied I should lose the greater part of the profit of them afterwards, yet I took it upon me the following year to milk them myself and give good feed, but to no purpose. I could not make them give milk much past the time they dried the year before. I have two cows now that were milked the first year they had calves until near the time of their calving again, and have continued to give milk as late ever since, if we will milk them.

Economy of Time and Systematic Farming. In the winter season you will do well to take breakfast by candle light. You will thus save an hour in a day at the least calculation, and in a week nearly or quite the working part of a winter's day. You may find a profitable amusement for several of these long evenings in contriving and laying out work to be done the next season.—You should have a plan of your premises, or at least a list of the fields or parcels of land of which they are

composed, together with notices of the soil, the preceding crops, the kind and quantity of manure, mode of culture, &c. &c. which have been bestowed on each. Then proceed to set down what is to be done in each field. Such as No. 1, Indian corn, the borders with potatoes of the Chenango sort, the corn in drills, after manuring with stable manure at the rate of — cords to an acre, spread evenly and ploughed under. No. 2, Spring wheat, &c. No. 3. Sowed with winter wheat last fall, to be ploughed immediately after harvest, for a crop of ruta baga, &c. &c.

Treatment of Domestic Animals. Keep up such a sort of social and friendly intercourse with the tenants of your stables, barn yards, and even your pig sty that they may be as tame as kittens, and prick up their ears and wag their tails with joy and gratitude whenever you approach them. Animals will not thrive even on custard and apple pye if they must eat their allowance with fear and trembling, expecting every moment to be all but annihilated by their cross keeper: who, we are sorry to say, is sometimes more of a brute than any quadruped under his care. Besides, if any of your stock should be sick, or lame and need doctoring, you can better handle, and give them their prescriptions, if they are accustomed to kind and familiar treatment, than if harshness and bad usage had rendered them as wild as partridges, and cross as catamounts.

Singular Modes of Fattening Cattle. In some parts of France according to an English writer on Agriculture, they fatten cattle with maize, [Indian corn] “but in order to render it tender, they pour boiling water upon it, cover it up close, and give it to the cattle the same day, and in this way it is a most excellent fattener, both of cattle and poultry. But in order to make them fatten sooner and better, they give them, every night, and sometimes of a morning, a ball of pork grease as large as an apple: they say this is both physic and food, and makes them thrive the better.

“The fact of hog's grease being given was confirmed at Souillac; it is given to increase the appetite, and answers so well, that the beasts perfectly devour their food after it, and their coats become smooth and shining. The most fattening food they know for a bullock is walnut oil cake. All here give salt plentifully, both to cattle and sheep, being but 1d. per pound. But this practice is, more or less, universal through the whole kingdom.

“In Flanders from Valenciennes to Orchies, for fattening beasts, and for cows, they dissolve linseed cake in hot water, and the animal drinks, not eats it, having various other food given at the same time, as hay, bran, &c; for there is no point they adhere to more than always to give a variety of food to a fattening beast.”

Young Cattle. Young's Farmer's Calendar, under January, contains the following observations. “Last year's calves should now be fed with hay and roots, either turnips, carrots, or potatoes; and they should be thoroughly well fed, and kept perfectly clean by means of litter: at this age it is a matter of great consequence to keep such young cattle as well as possible, for the contrary practice will inevitably stop their growth, which cannot be recovered by the best summer food. If hay is not to be had, good straw must be substituted; but their roots should be given in greater plenty, and with more attention. To steers and heifers two years old, the proper food is hay, if cheap;

or straw, with baits of turnips, cabbages, &c. It is not right to keep yearling calves, and two year olds together; because in general the younger cattle are, the better they should be fed.”

Sucking Calves. Although the following article was published in the N. E. Farmer, vol. viii, page 76, we republish it for the benefit of those of our subscribers, who may not be in possession of that volume, or may have forgotten or overlooked the information which the communication contains.

A very intelligent and practical farmer states that he considers nothing more conducive to the thriving of sucking calves than to keep in their pens an ample supply of dry yellow loam, of which they are at liberty to eat as freely as they choose. They will use it eagerly, and he regards it as of more value to them than Indian meal. There is no better evidence of its utility than the fact that no man's calves find a readier sale or bring a higher price in our market than his. The philosophy of it we do not pretend to explain. S. X.

From the Genesee Farmer.

SEEDLINGS FROM GRAFTED AND UNGRAFTED FRUIT TREES.

We lately thought the Indian peach had produced no distinguishable sub-variety. We had seen a great many seedlings of that kind which were not distinguishable from each other; but we have very lately had ocular proof that when the parent tree grows amongst other kinds, the offspring is liable to vary. In one small lot we have been a number of seedlings, all sprung from seedlings, some ripening their fruit several weeks before others, and some having fruit of a much finer red than others; yet all of it has the long oval shape and the tartness of the Indian peach.

By these observations we are therefore confirmed in our former opinion that the offspring of seedlings, under similar circumstances, are as liable to vary as the offspring of grafted trees.

If we were called on to give a reason for the origin of the contrary opinion, we should suggest that it sprung, like other erroneous opinions, from a neglect to take into view all the facts. Where only one kind is cultivated, the offspring is not subject to the changes arising from hybridism; neither would the offspring of any other solitary variety, though grafted, be subject to these changes. Those who graft however, are the most likely to introduce different kinds which will almost as certainly introduce changes into the seedlings. It is not uncommon to mistake one cause for another.

From the Fall River Recorder.

WONDERFUL CURE.

ELIAZER Chase of this town, some seven or eight years ago, in cutting stone broke off a piece of cast steel from some of his tools that flew into one of his eyes and caused the loss of its sight. The steel remained, which made the eye extremely susceptible of heat and cold, and caused frequent severe inflammations, with great pain and suffering. Last winter and spring he suffered extremely, and serious fears were entertained by himself and friends that he would go off in a consumption. One alternative alone presented itself, to prevent this fatal catastrophe; and that was to have his eye cut out, the steel that remained in continued to irritate to that degree, and without hope from any other means, and fast declining, and continually tortured by this direful malady, he at last came to the conclusion to submit to the advice of his physician,

and have this shocking operation performed. About this time a friend of his told him of a remedy; which was, to apply to his eye a magnet and draw out the steel. One was procured of great power and applied—the second time of application the steel came out and relieved his eye from the irritation that had been so very severe; and he is now about his usual avocations, and saved the dreadful operation of having his eye dug out.

Let this be remembered; it may be of great use to some other sufferer. It is quite possible that had the loadstone been applied in season that it might have saved the sight of his eye. I hope this circumstance will be generally known through the country, as it may be the means of doing much good to those suffering from similar causes.

A PANTHER IN SUSSEX, N. J.

A PANTHER was killed last week, by Mr. Joseph Curran 4 or 5 miles east of this town. He had been prowling round the neighborhood for some time, and on one occasion had caught and dreadfully lacerated a dog belonging to Mr. C. At length the animal grew so bold that he gave chase to a woman, who fortunately reached the house before her pursuer came up with her. Mr. C. immediately set his dogs upon him, and seizing his gun and axe, sallied out to give his savage visitor a suitable reception. He was soon driven up a tree, from which, after having received three bullets, he descended, and gave battle to the dogs, when Mr. C. by a fortunate blow with the axe, laid him lifeless on the ground. The animal measured about six feet in length, and was stout in proportion.

SEEDS FOR 1834.

FOR sale at the Seed Store connected with the N. E. Farmer Office:

- 200 bushels finest Early Peas;
- 100 " Large Marrowfat do.;
- 25 " Dwarf Blue Imperial do.;
- 50 " other varieties;
- 100 " Best Garden Beans;
- 100 " Dwarf and Pole, Early and Late, do.;
- 300 lbs. superior Long Blood Beet Seed;
- 100 " Early Turnip " " "
- 300 " Cabbage Seed, 14 different kinds;
- 250 " Fine Long Orange Carrot;
- 100 " Early Horn, do.;
- 200 " Common Cucumber;
- 150 " Long Green, do.;
- 100 " Early and Head Lettuces;
- 25 " Pure White Portugal Onion;
- 100 " Silver Skin " "
- 100 " Large Deep Red, " "
- 200 " Large Dutch Parsnip;
- 150 " Early Scarlet Short Top Radish;
- 50 " Long Salmon, do.;
- 25 " Turnip Radishes;
- 100 " Spinach;
- 150 " Early Scollop Squash;
- 50 " " Long " "
- 50 " Long Winter, do.;
- 25 " Salsafy;
- 100 " Early White Dutch Turnip;
- 200 " English " "
- 100 " Rota Baga, " "
- 200 " Mangel Wurtzel For Cattle.

Also—Cauliflower; Broccoli; Celery; Cress; Egg Plant; Leek; Endive; Musk and Water Melons; Martynia; Pepper; Parsley and Tomato Seeds by the lb. or oz. *Herb Seeds*, of all kinds.

50,000 Papers in 200 to 300 splendid kinds of *Annual, Biennial and Perennial Flower Seeds*.

GRASS SEEDS, Wholesale & Retail.

The above comprises in part the stock of seeds raised expressly for the establishment, and the quality and goodness will be warranted superior to any ever offered heretofore. Dealers and others will please file in their orders immediately, and they shall be faithfully executed for the spring.

Bags of Garden Seeds for the country trade, neatly papered up, with directions on each paper, for sale at a large discount from marked prices.

FRUIT & ORNAMENTAL TREES, &c. will be supplied in the spring, and orders are solicited.

GEORGE C. BARRETT, Agricultural Warehouse, No. 51 & 52, North Market Street.

MASSACHUSETTS HORTICULTURAL SOCIETY.

AT a stated Meeting of the Massachusetts Horticultural Society held this day, it was voted to call a SPECIAL Meeting of the same, to be held at the Hall on SATURDAY the 4th day of January next, at 11 o'clock; and to request that the following Committees of the Society should be present:

On Fruit Trees, Flowers, &c.
On Culture and Products of the Kitchen Garden.
On Ornamental Trees, Shrubs, Flowers and Green Houses.
On the Library.
On the Synonymes of Fruits.

A general and punctual attendance of the Members of the Society is expected.

Dec. 21, 1833. ZEBEDEE COOK, Jr. Vice President.

FRUIT TREES.
ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

NOTICE.

A capable, faithful and industrious young married man who should be disposed to take a Farm (upon fair terms) consisting of about 90 acres of good tillage and pasture land, within eight miles of Boston, and within half a mile of a growing neighborhood, where he would find a profitable, ready and sure market for a regular supply of vegetables—which advantages, with that of supplying milk in the City, would ensure him a lucrative and encouraging support—may hear of such an opportunity, on a personal application to the publisher and proprietor of the New-England Farmer, at the Agricultural Warehouse, Nos. 51 & 52, North Market St., Boston—possession may be had the 1st of April next.

Boston, December 18, 1833.

STEAM RICE MILL, AT SOUTH BOSTON.

THE subscriber having purchased the Patent Rice Machines of Messrs. Strong, Moody & Co. of Northampton, with the exclusive privilege of using them in Boston and a large vicinity, has put them in operation at South Boston, near the Free Bridge. It is well known that rice in its rough state, or with its outer hull on, will keep many years, and that after been cleaned, it is subject (particularly in warm weather) to weevil, and other insects, and is usually put in bad casks—he therefore hopes, by having this article always in a fresh state, in casks of different sizes, to meet with a ready sale. The mode of cleaning being entirely different from any other now in use in any other country, the grain is kept quite whole and very clean. It will be put in good casks of usual size, for export; also in barrels and half barrels, and in bags of 100 lbs. each, (which may be returned;) also ground into fine Flour, in quarter barrels—it will be delivered in any part of the city, for a reasonable charge, and will not be sold in smaller quantities. Also, the fine Bran, or Flour, so called in the Southern States, being the inner coat of the grain, excellent food for horses, cows, hogs, sheep and poultry—and the outer Hull, a prime article for packing glass, crockery, bottles and fruit, and is believed will prove valuable in making Coarse Paper, will be sold at a low price in large quantities.

This Rice is particularly recommended for whaling ships and others going long voyages, as from being highly polished, and free from dust and flour, and being put into their tight iron-bound casks, it will be free from any insects, until exposed to air.

An Order Box is placed in Mr. Roger's Foreign Letter Office in the area of the City Hall, and a sample of the Rice in several Insurance offices. State street. JOHN PRINCE. South Boston, Nov. 16, 1833.

NO. 26.

THE HON. JUDGE STRONG'S ADDRESS,
Delivered before the Worcester Agr. Society, Oct. 9th, 1833.
[Published in the N. E. Farmer at the request of the Trustees.]

GENTLEMEN OF THE AGRICULTURAL SOCIETY,

WHEN first invited by your Board of Trustees to address you on this occasion, I felt such a diffidence, and distrust of my powers and qualifications for the suitable performance of such a duty, as almost induced me to decline the honor. When I considered the high respectability of the audience, which I should here meet; when I considered the many eloquent addresses which had, from time to time, been delivered to you; and the high standard of excellence which you and the public would require from any person who should stand in this place on the day of your anniversary: I doubted whether it would be possible for me to satisfy you, or even myself. I considered that I was not a practical agriculturist; that I was not particularly acquainted with the subject; and, that I had not for many years been in the habit of addressing public bodies, unless the regular discharge of the duties of my office may be considered an exception. In the discharge of those duties, however, confined as they are within such narrow limits, little scope is given to the powers of oratory; and they are very little, if at all calculated for improvement in eloquence. On the other hand I considered, that I had been invited to the task by men highly respectable, representing a society equally respectable; that I was myself a member of this society; and, though I highly approved of the objects of the association, and saw with the greatest pleasure, from year to year, the beneficial effect of their exertions in every part of the county, I have myself done little or nothing to promote these important objects. It seemed to me to be my duty under the circumstances, having such a favorable opportunity, to make one effort to discharge in part the obligation which I and every one interested in the subject, owe to this society.

It will not be disputed that agriculture is a subject of great importance; and that every proper mode should be adopted for its encouragement and improvement. Agriculture is the foundation of the subsistence, the comfort, and even the luxuries of society. It supplies the necessities of life, and furnishes most of the materials of manufactures and commerce. It spreads the table of the cottager, provides the substantial comfort of the middle classes, and administers to the luxury of the rich. It feeds, it clothes, and furnishes employment directly or indirectly for almost the whole community. Agriculture is at once the cause and evidence of civilization. No nation has ever made much progress in civilization without making a correspondent progress in the art of agriculture. When nations subsist by hunting and fishing, they are always savages. When nations subsist by pasturage, by driving large herds of cattle over an immense extent of natural pastures, they are but one degree removed from the savage state, and the arts of civilization can hardly be said to have dawned upon them. Though they have more of the principle of association than the savage; and, to a limited extent, a community of interest; yet there exists among them the same predatory disposition, the same disregard of the rights of others,

the same looseness of principle as it respects individual property; very little progress is made among them in the cultivation of the social affections, or in the establishment of the lowest, plainest, and fundamental principles of moral duty. But, when nations begin to cultivate the earth, as a principal means of subsistence, when the individuals fix themselves upon particular portions of the earth's surface to obtain subsistence from the fruits thereof, the products of their own labor, a foundation is laid for something like a regular government, law, order, regard to the rights of individuals, and protection to private property. From this period, improvement in agriculture and amelioration of government mutually act upon and favor each other. The improvements made in agriculture require, and necessarily require a correspondent amelioration in the government; and as the government makes greater and greater progress towards perfection, it reacts upon agriculture and accelerates its progress. In the course of time, manufactures and commerce spring up, as the necessary result of an enlarged, extended and greatly improved agriculture; and we at last see that elevated state of civilization which we now enjoy. Though other countries and other climes are blest with warmer suns, with brighter skies, and with a greater degree of fertility, the surface of the earth covered with a more exuberant vegetation, and the native and adopted products have a more extensive circulation, and occupy a larger space in the commerce of the world than the substantial and useful plants adapted to our soil, and the temperature of our climate; yet the productions of our agriculture are highly important to us; and when their various and important uses are considered, may well be the subject of eulogy. We cannot produce the sugar cane, the cotton plant, or the tea plant; but wheat, rye, Indian corn and the potato will flourish here in all their luxuriance, and make the most abundant returns to the well directed industry of the cultivator. The orange, the lemon, the pine apple, the fig, the olive, and other rare fruits of tropical climates, cannot be seen here except as an article of commerce brought from distant countries; but we have the apple, the pear, the plum and the peach—fruits which from the beauty of their appearance and richness of taste, may well vie with those of any other country. We have not as yet, and it is doubted by some whether we ever can raise the grape in a climate of our temperature, so as to produce wines of the richness of flavor of those which come from warmer climates. But we have the apple, from which by a proper attention in the selection and cultivation of the best fruits, and the making and preservation of the liquor, a beverage may be made equal or nearly equal to the wines of other countries.

Wheat is a most valuable vegetable. It furnishes the most abundant, the most palatable, and the most healthful of all farinaceous food. It seems to have been given by Providence to man to sustain him in all his wanderings over the widely extended surface of the earth. The number of species of this genus is greatly multiplied, and some one is adapted to grow, and flourish, and furnish food for man in almost every part of the habitable globe. From the great number of its species, and

their adaptation to different climates and soils; from the ease with which it may be raised in many soils; from the facility with which it may be manufactured into flour, and transported to every part of the earth; and from the portableness, nutrition and healthfulness of the food which it furnishes, this may be ranked among the richest products of agriculture.—Rye is a very useful plant to the New England farmer. It is, to him, an important bread stuff. When used alone, or mixed with Indian corn, it furnishes a substantial and healthy food. It may be made to grow and flourish in many soils where wheat and Indian corn cannot be successfully cultivated; and where the soil is properly adapted to it, perhaps there is no crop raised by the farmer, where the value of the return bears so great a proportion to the labor bestowed upon it.—Indian corn is a highly valuable plant to the farmer. It is more hardy than wheat, and will grow advantageously in many situations where wheat will not flourish. This plant is peculiarly valuable in the rough and hilly portions of New England where wheat cannot be advantageously raised, except when the lands are first cleared. It furnishes a wholesome bread for the farmer's family, a grain better adapted than any other for the fattening of swine, and is valuable fodder for his cattle.—The potato is emphatically the poor man's plant, and the poor man's food, though it now constitutes a portion of the food of all classes. It is the cheapest food which can be raised in New England. This vegetable will grow almost anywhere. If planted on good land, and good care taken of it, a good crop will be produced; if planted on poor land, and very little care taken of it, a considerable crop will be raised; and let the season be what it will, hot or cold, wet or dry, a moderate crop at least will always reward the labor of the farmer. It is not only very cheap, but very healthy food; and those who subsist chiefly upon it find it to be not only very wholesome and nutritive, but also greatly conducive to strength and vigor. The judicious and intelligent farmer will also find an important use for this vegetable in the fattening of his swine, and neat cattle; and also, to increase the quantity of milk for his dairy.
